Roofing slate is placed under this head, and a fine display by E. N. Robinson, of the California Slate Company, is one of the good and novel features of the Fair. Slate quarries in the East and in Europe, furnishing a good material adjacent to market, are worth their hundreds of thousands; and Mr. Robinson has proceeded logically and correctly in developing with energy this new industry on the Pacific coast. Brick we must have — and slate is equally indispensable, architecturally as well as from fire. There are about three dozen cases of slate in marketable packages of one by two feet dimensions, all mined near Copperopolis, in Calaveras County, several packages being from Dr. Holden's mine. This slate is clear of pyrites; which, unless we are at fault, is rare even in that region, and implies much sorting. But the specimens exhibited in considerable quantity are perfect, taking nails with less liability to split or break than any kind of wood, and as thickly as they can be driven, or about one nail to every square inch, in a slab that is to be seen leaning against one of the boxes.

Freeman's stair work, consisting of rails, posts, and balusters, makes a fine exhibition, architecturally,—stair work concentrating all art in architecture.

Light and Darkness.

An article of importance which we were unable to find is set down as "Lynch's improved reflector for cellars, vaults, etc." Daylight is as invaluable as it is cheap, but when men make of themselves worms, crawling through subterranean vaults and basements in the city, heaven's cheerful blessing will not follow unless we can artfully coax it after us into the darkness by some artificial means. The greatest skill or incompetence of an architect is, as a rule, displayed in that which he does for us with the light; because it is light, presented to us in its most favorable phase that gives cheerfulness and the natural conditions of happiness to the interior of our rooms and dwellings. Architects fall sadly short in these matters—indeed, one must be one's own architect to have them attended to at all. We doubt not but that a great deal might be done by the use of reflectors.

Wood Preserving.

Neither of the two wood-preserving establishments in this city—the Samuels sulphate of copper, and I. C. Wood's creosote or oil tar processes—have met with the full measure of success that their merits undoubtedly warrant in our timberless valleys and toredo-infested harbors. Only the oil tar process is represented at the Fair—by a table made of treated wood, and some samples of street pavement and piles, both of which have been tested—against enduring heat at 120° in one of the sugar refineries, and against the toredo, with highly satisfactory results. If it is any object to speculators in improvements to have their work last twenty or thirty years in the place of five, they will find it exceedingly economical to undergo the preservation treatment. The usual intention is to sell out before five years expire. Chemically these processes are founded in fact—in the unaccountable and explainable facts of organic chemistry, which tell us that both creosote and sulphate of copper have the quality to render the juicy parts of the woody fiber less soluble and liable to the influences of air and moisture, operating like antiseptics.

Another wood preserving or seasoning process by pressure, to prevent contraction and cracking, is represented by some specimens on the counter opposite to the Fair Press, showing that a hole bored along the grain can be made so as not to shrink in the severest test of kiln drying.

Marble and Marbelized Slate.

J. Daniel exhibits some nicely worked California and Roman marble mantles, and the California Slate Company have just brought in a novelty in what is denominated "marbleized slate." They take certain qualities of slate found in their quarries and shape it into mantles, billiard table plates, or other articles of utility or ornament, and afterwards subject it to a hardening process, which increases its tenacity and improves its appearance decidedly.

CLASS VI.

PHILOSOPHICAL, SURGICAL AND DENTAL INSTRUMENTS.

Mr. Roach's case of mathematical and surveying instruments contains specimens of the best theodolite, transit and levelling instruments that are made, besides other instruments, such as the cistern barometer, the camera lucida, etc. While adapting these instruments to the requirements of the country, or the preference of its engineers, Mr. Roach has, in the few articles exhibited, done work which is equal to that of the finest of the renowned makers of Philadelphia and Troy, or of Europe; since European engineering with all its thoroughness, falls short of the American in the handiness and completeness of the common working instruments used. The solar compass, of which Mr. Roach exhibited a superb specimen last year that drew a premium, is scarcely known amongst European engineers of the highest reputation. We have new counties and State boundaries to survey, and need instruments wherewith we can go straight to the mark with the fewest number of men; such as will do either for approximate or for thorough work. We got rid of many of the complications of European makers, which, it must be admitted, are often very good for special works. As to price, a set of working instruments of any kind can be obtained in Europe for half the American prices, to which must be added a duty that will bring the cost nearly to an equal figure. A good working engineer will look to it, however, that the instrument shall be to his suiting, at any price.

Roach casts extra variation plates for his transit and theodolites, whereby the needle may be used occasionally, precisely as in the ordinary compass, or the variation incidentally noted—an exceedingly practical appliance for this country, which for some reason, probably mechanical, is generally omitted in instruments of the kind. The graduation in these instruments is right and left to 90°, while in European instruments it is to 360°, contrary to the hands of the clock. They are of brass, covered with a dark bronze to prevent tarnishing.

Miscellaneous.

A "heliotellus" and "lunatellus" (orreries) are shown by Bancroft & Co., and a terrestrial globe by Holt. The former are a Philadelphia invention, and are new in revolving in a vertical plane.

The standard scale men—Fairbanks and Howe—are in the field through their agents, Hutchinson and Parkhurst, each with a dozen standard and counter scales, and equally patronized, by the feminine palpabilities, especially, of the Fair and their beaux.

Amongst other novelties, the movements of the Elgin watch, as made by machinery, dissected and placed on cards, are laid open to our inspection. Phillips's portable blowpipe assaying apparatus has already been described by us, the principle being that of a combination of four blowpipe flames on an assay of nearly or quite the crucible size; but having also an arrangement which enables the inexperienced and short-winded to recover their breath. With great ingenuity all is made to go into a very small space, including the necessary blowpipe fluxes and reagents.

Surgical and Dental.

The surgical and dental instruments shown include several original things. The trusses of Drs. Mahon & Folleau have an arrangement by which the pad fitting into the aperture is easily made small or large, to adapt it to the feeling of the patient; and there is an improvement on the artificial leg, whereby the clumsy upper part fitting around the thigh, often heating it disagreeably, can be much better dispensed with. Dr. Braun has also a case of trusses, in which we notice a peculiar pad with a spring attachment.

Mrs. M. A. Saydam shows three "patent cornea restorers." As age grows, there is a tendency in the cornea to sink into the watery fluids of the eye; and this is an invention to bring it back mechanically. A rubber appliance is placed like a cup over the eye, and by a gentle motion, the air in the interior is exhausted. This sucks the entire parts exposed outwards, but is supposed to have most influence upon those that should come naturally.

A curious dental appliance is that of Dr. Belle, for extracting teeth. It is a red tank in which a freezing mixture is prepared, and placed in such a manner that the Doctor is enabled almost instantaneously to freeze, or rather to benumb, the gums and nerves of the patient, so that, theoretically, he feels no pain.

Telegraphic Instruments.

Telegraphic instruments are shown by the two business colleges, and by Lundberg & Marwedel, manufacturing telegraphists, but there is nothing new or original that we discover, except Land's electrical tension balance, the rest of Lundberg & Marwedel's case being filled up with registers, sounders and relays of the various forms in use. The business colleges both use Morse instruments.

CLASS VII.

MANUFACTURES IN METALS.

This class comprises a large variety of articles, such as tools, stoves, and all the various products of iron, brass, lead and copper. The articles are numerous and scattered; but in our review we have endeavored, as far as practicable, to group them together for the convenience of reference.

THE PACIFIC ROLLING MILL.

The first in importance, perhaps, in this department, should be mentioned the display of the Pacific Rolling Mill Company. They exhibit hammered and rolled shafting, round, flat and merchant iron, hand iron, street railroad iron, horseshoe shapes, railroad axles and spikes, machine and log bolts, etc., all the products of their own works. These works have been erected, regardless of expense, so far as was necessary to provide the best of machinery, and to meet, to the fullest extent, the wants of the Pacific Coast, in their line of manufacture. The establishment of these works forms one of the most important steps of progress in the history of manufacturing enterprises in California.

SAN FRANCISCO LEAD AND SHOT WORKS.

Next in importance may be mentioned the display of T. H. Selby & Co., of the San Francisco Lead Works. This company has spared no expense or labor in providing the best and most approved class of machinery for their works, in the erection of which they have kept in view the future as well as the present wants of the Pacific Coast. They exhibit pig lead, lead and tin pipe, drop shot and lead ore. Sheet lead is manufactured by this company of any shape desired, thus enabling the purchaser to calculate closely upon cutting for use, so as to lose but a very

small quantity. Their extra shot is pronounced, by experienced sportsmen, to be superior to the best imported. This institution being a California entarprise, the managers have taken great pride in rendering it aecond to none in the world.

Tbe display of tin ore, pig tin, sheet tin and tin ware from the San Jacinto Tin Mines of California, forms another most important and auggestive exhibit, the value of wbich cannot be too highly estimated, and presents the germ of wbat may soon become a business of national importance. We have already in a previous issue spoken quite fully of this interesting exhibit.

The Pacific Saw Manufacturing Co., of this city, makes a splendid exhibit of everything belonging to their specialty, which has already been fully noticed in the Press. Mr. N. W. Spaulding, a membar of this company, and tbe inventor of the saw tooth wbich bears bis name, makes an exhibit of the sama. These teeth have now come into very general use, both in Califbrnia and the Atlautic States. The American Saw Company exhibit samples of moveable teeth, and perforated and solid saws. The specialty of the saws of tbis Company consists in punching holes bebind the teeth, for the purpose of simplifying the process of filing, and for the more ready removal of the aaw dust while in the act of cutting lumber.

The San Francisco Screw and Bolt Works, Phelps Bros., exhibit several boxes of their manufacture from their establishment, Nos. 13 and 15 Drumm street. This company turns out none hut first class goods ; they use the best refined iron for tbeir works, and tbeir present macbinery has a capacity for about 4,000 bolts per day. This is an important branch of mechanical industry, and deserves well of the public.

Safes.

In the line of safes, Mr. Jona. Kittredge, of 18 Fremont street, makes a most imposing display. The beholder can form but a very faint idea of the merits aud vast amount of genius and labor hestowed upon these massive constructious until he sees them opened and inspects their interior intricacies. These safes are represented as being positively burglar-proof, and as near fire-proof as they can be made. The locks are massive, and made with all the cunning of tbe most ingenious locksmith. The fact that they are of California manufacture adds still further interest to the display.

The only othar exhibit in this line is the single show of a Pacific safe, with improved lock bolts, from the establishmant of Kittredge & Leavitt, 225 and 227 Beale street, upon which is placed one of Wm. C. Bussey's California keyless locks, burglar and powder proof, and said to be the best combination lock in the world. These locks are made at the establishment of Kittredge & Leavitt.

Brass Work, Etc.

Mr. W. T. Garratt makes his usually extensive display of brass work, all from his foundry corner of Mission and Fremont streets. His collection always forms a conspicuous feature in the exhibitions of the Institute, and comprises a most beautiful and extensive assortment of articles in his line, such as churcb, steamboat, hotel and alarm bells, steam gauges, nozzels, pipes, faucets, etc. His exhibit is located just to the right of the entrance to the Art Gallery from the machinery department.

Gallagher, Weed & Co. also make a fine exhibit in, this line, of whistles, gongs, hose pipes, couplings, nozzles, gas cocks, etc., all of their own manufacture, and all of excellant workmanship and finish. Their case may be seen on tbe north wall of the machinery department. Messrs. Garvey & Kimhall make a fine exhibit of steamboat and house bells, pulls, hnobs, etc.; Will & Finck exbibit two hotel enunciators.

Wire Works, Etc.

A prominent and beautiful feature is the extensive exbibition of wire works made by H. T. Graves, every article of which is from their factory in this city. Their sliding window screens are really beautiful, and are admired by thousands for their ornamental as well as useful qualities. They may be aeen nearly opposite the Daily Fair Press atand, on the machinery side of tbe hall. He exhibits a wire summer house of sufficient siza to accommodata a large party, cbairs and lounges with ateel spring seats; alao bird cagea, dummies and an innumerable list of useful articlea in his line of trade. Mr. Graves also exhibits Cramer's Patent Combined Door Plate and Letter Box, a convenient and most uaeful inventiou. Joshua Gray exhibits samples of broom, piauo, solder, and hook and eye wire, plated and plain, all from his manufactory on Brannau street, uear Third.

Stoves and Cooking Apparatus.

There are a great number of cooking stoves on exhibition, with various and sundry contrivances appertaining thereto. Perbapa the finest exhibit in this line is made by Brittan, Holbrook & Co., who exhibit several of the "Peerless" cooking stovea, which present several new and very desirable features. They also exhibit stove fixturea of copper and tin, also tinware, and a lot of elegant Japanese ware. E. Ayers exhibits two of the improved American Hot Air Stoves, which have attained great popularity at the East, and which are fast finding their way into the kitchens of California; also several of smaller size, and a parlor stove. Scbuester Bros. exhibit Richmond's Portable Range; also the Union Range of tbe Barstow Stove Company, of Providence, each of which, it is claimed, possess numerous and important advantages. John Bohn exhibits three of the celebrated Model Cook Stoves, with fixtures. Jobn B. Owens, several coal oil stoves and heaters, in which the heat is generated by kerosene; also various other usefnl articles for tba nursery, etc. George Reuben exbibits samples of patent saucepau covers. Mr. Bullard exhibits Perbam's stovepipa extension shelves, a new and very convenient article of stove furniture, which we bave already noticed at length. William Jones, of Butta County, exbibits on the Mining and Scientific Press counter, steam pressure culinary vessels. A. C. Taylor exhibits his patent slop-hoppers, with patent traps, patent iron sinks, coffeepots and dish-pans, all of his invention. August David exhibits two ice cream freezers, of novel and most serviceable construction; the Standard Soap Company, a submerged coffee pot.

Tools, Etc.

Among the tools we notice a case o highly finished twist drills, ateel squares, etc., exhibited hy Chas. Otto; two pairs of wire cutters, by Henry Axtell, illustrated in our edition of Sept. 23d; Mathew Cook exhibits the "Little Giant" blasting wedge, which, after being driven into a log, contains a cbamber into which powder may be charged, fuse attached, and the charge secured by a set-screw, without tamping; P. Riley exhibits two pair of gas-pipe tongs, presenting au ingenious and most effective combination of parts for grasping and holding work; Messrs. Kindleberger & Arnold show their reversihle loose joint butts, which we have already fully described; an instrument combining a stove handle and other household tools is exhibited by F. B. Lamb; David Stoddard exhibits in this department six English ratcbet bracas aud five turning tools.

J. H. Culver, tbe accommodating entry clerk, exhibits an improved construction of calipers, by which tbe internal as well as the external diameter of a hollow globe witb only a small opening, may be readily measured, also other irregular surfaces, wbich cannot be reached for measurement hy the calipers iu ordinary use—tbe improvement consists in constructing a moveable joint on one of the lags. Machiuists will do well to take a look at tbis instrument Mr. K. Vail exhibits four irou planers—Palmer's patent; Currier & Howard exhibit Howard's improved mitering machine.

Miscellaneous Exhibits.

Among the miscellaneous exhibits we notice a fancy shoeing hammer, and a large tuning fork, by Morgan Gale, on exhibition in the M. & S. Press case; a combined carpenter's tool, by John Nestor, of Portland; samples of California-manufactured horseshoes, by Misgill & Cooper; a combination lock of California manufacture, patented through the M. & S. Press Agency, by Ephraim Vorbe; chopping knives, by E. T. Houghton, also automatic clothes washers and boilers; combinad latch and lock, by John McLeod; M. Price, cutlery; case of molding tools, by Carl Hinz; J. C. Hammond exbibits samples of I X L metal for friction bearings and journal boxes, a new metallic alloy recently patented through the Mining and Scientific Press Patent Agency; R. F. Osborne, a case of cabinet hardware, another of carriage hardware, and one of tools; two fire ligbtera, by Jacob Wbitney; a large assortment of lanterns of various patterns, by A. L. Stemson, of Cbicago; case of brass and plated goods, of California manufacture, by Charles Otto; tbe Risdon Iron Worka exhibit four car wheels of their own manufacture; Root & Nye make a very fine exbibit of chandeliers, in blue, gold and gilt, and in Euglisb, French, Egyptian, aud Flemish styles; also gothic standards, marble ornaments, bronze figures, etc.; Cassin & Proctor exhibit a funnel—patent applied for; C. H. Foster exhibits a substitute for brass hinges, a valuable invention, which we shall notice at length hereafter.

CLASS VIII.

Wood and its Manufactures.

It is satisfactory to know that we are progressing in our knowledge of application of the capabilities of the woods of this coast. We have just fonnd out that there is a boundless supply of splendid ship building timher—tbe north coast pine and Alaska cedar, the best material in the world, and to be had at the water's edge. The evergreen Oakland, Napa and Russian River oak *(Quercus agrifolia)* and the Clear Lake, Santa Rosa and San Jose White Oak *(Q. Garryana)* furnish first rate articlea for casks, and the latter for ship knees,—so that within a year or two all the cooper shops, wine cellars, and liquor stores in the city bave been filled with bright new, solid, and often very large sized casks made of them, by thousands, to the justly meritad profit of those who have sought out and utilized their merits for the market. Laurel is more beautiful than the rich woods of Honduras and Brazil, as we all know who have seen Strahle & Hughes' palace, or the exhibitions of Boyd and Thayer of last year. We have not yet begun to know the value of all we possess in this department of our resources. The koa wood of the Sandwich Islands is represented by a piece leaning against Strahle & Hugbes' palace ; it should command the prices of mabogany and rosewood, and undoubtedly would in the European market. Everything in the wood line is now made by ourselves, except fine or wholesale furniture, soma casks, and the hard and tough wagon manufactures, the wood for wbich is to a large extent imported in bulk and worked up on this coast. Oregon maple keeps company with laurel for certain purposes, but is not equal in its fineness of natural color and grain, nor in its capability for staining in imitation of any otber of the precious woods most fancied. The birch, ash, and oak forests that were to have bean discovered iu Alaska, do not exist ; but the best kind of cedar does, in quantity. Of our own woods, those most used for cabinet work are laurel, sugar and Oregon pine, Spanish and white cedar, and redwood ; for wooden ware such as buckets, pine and redwood ; for powder kegs, pine witb native hazel hoops ; for the larger and coarser kinds of engravings, laurel and pine ; for railroad cars, ties, and bridge timbers, piue and redwood.

As we are wanting in tough and elastic woods for manufacturing on this coast, the following table of woods according to tbeir qualities and uses will be found valuable in this connection :

Qualities.

Elasticity.—Ash, hazel, hickory, chestnut, yew.

Elasticity and Firmness.—Beech, elm, lignum vitæ, oak, walnut.

Even grain (for carving and engraving).—Pear, pine, box, lime, laurel.

Durability (in dry works).—Cedar, oak, poplar, yellow pine, chestnut, redwood.

Coloring Matters.—Red: Brazil logwood, Nicaragua, etc. *Green:* Green ebony. *Yellow:* Fustic, zanta.

Scent.—Camphor, cedar, rosewood, sandal, satin wood, sassafras.

Uses.

Building: Ships.—Cedars, pines, (deals) firs, larches, elm, oaks, locnst, teak, Oregon pine, white and Alaska cedar. *Wet construction, as piles, flumes, etc.;* Elm, aldar, beecb, oak, white cedar, and California spruce.

House Carpentering.—Pines, oaks, whitewood, chestnut, asb, spruce, aycamore, Oregon pine, sugar pine and redwood.

Machinery and Mill Work—Frames : Ash, beech, birch, pines, elm, Oregon pine, mahogany, oak. *Rollers, etc.:* Box lignum vitæ, California white oak and live oak, mabogany. *Teeth of Wheels :* Crab tree, locust. *Foundry Patterns:* Alder, Eastern pines, Oregon pine. mahogany.

Furniture, Common: Beech, birch, cedars, cherry, pines, white wood—everything. *Best :* Ebony, cherry, mahogany, maple, oak, rose, satiu, sandal, chestnut, cedar, walnut, laurel.

Tbere is no general collection of woods at tbe Fair, such as any of our wood or lumber dealers might have gotten up with very little trouble. A full botanical description of tbe California woods is given in Cronise's Natural Wealth of California.

Veneering.

Strahle & Hughes' billiard exhibition embraces only laurel for veneering, but is such a display in that line as is seldom made, to advertise the beauty and merits of any one kind of wood. Korbel & Co., of South Park Saw Mill on Brannan atreet, and Ludolph's mill near Russian River, did tha sawing, the results baing wonderfully thin,—of the appearance of pasteboard, and pasted upon otber wood like paper, so tbat tbe existence even of the veneering is not likely to he discovered. George A. Brush exhibits some very perfect imitation laurel made of pine. J. C. Thayer sbows tbe size of some of our laurel trees by exbibiting in front of the Pavilion a stick of timber 48 feet long and 28x28 inches tbick.

In miscellaneous wooden manufactures Elam & Howes' factory takes the lead, the exhibition consisting of a fine display of baskets, tubs, wash boards, refrigerators, cheese boxes, cburns, powder kegs, etc. Such factoriea shonld come into existence in the foot hills, on the line of the railroad, where there ia water power. At Truckee one of the saw mills has already developed into a planing and manufacturing mill ; but wooden manufactures should be local to supply local demands.

Barrels and Casks

Of Russian River oak, looking very anbatantial, are exbibited by F. M. Arnold, and by Fulda & Co. of the California Wine Cooperage Co., the latter astablishment being represented by a 4,265 gallon cask about 12 feet in diameter,—a relative of the great *tonne* of Heidelberg, which is about 30 feet in diametar. Fulda is the inventor of a very fine stave-edging machine, with which the work on this cask can he done in three honrs, while by band labor it would require two and a half days.

Brushes and Brooms.

In brush manufacturing, Figer Brothers take tha lead, exbibiting two dozen kinds of brushes, for every conceivable purpose, from imported bristlcs we presume ; amongst them, a "sluice hrush," for sluice concentration, wbicb is not a bad method for the aeparation of fine mineral substances hy their specific gravity. Brooms, from the factory of S. P. Taylor (the paper manufacturer), are shown in all sizes, and of such quality as to supersede imported articles of tbe kind, It ia needless to remark that an articla of snch large consumption can ba manufactured to great advantage in California. Gilroy, Folsom, and places adjacent to the corn-fields, are able to compete, however, with the city mannfactories.

Ornamentation.

The pyrographic wood in the art gallery, exhibited by Blyth & Wetberbee, suggests a new field for ornamentation in wood manufactures. Designs are burned into wood with beautiful effect. A similar specialty is that of carved hureau bandlea and the like, as ahown in R. F. Osborn's case of cabinet hardware. Art in homely surroundings is thus becoming cheaper and cheaper, and taste, rather than fortune, may beautify every man'a home.

Willow Work, Eto.

Overland lunch baskets, scrap baskets, chairs, cradles, etc., ia rapresented in a fine exhibition from Hall'a Pacific Willow Works. Coleman'a Union Boot-jack, and otber like small articles, too numcrous to mention, completes our list under this head down to

Washing Machines.

Of these the nnmber is always large at a Fair ; and to the newspaper critic the journey amongst them is like voyaging hetwean Scylla and Charybdia. They are all good, and all the best. Tbe newest one is a California invention, by Frank Buckalew, consisting of a vertical wheel with arms, to tbe ends of whicb the clothes are attached. Tbe wheel being turned, the clotbes are rinaed in water and taken out in rapid succession. Witb soap, and some slight friction against the walls and top of the box, all impurities are made to disengage themselves tbat can he done without rubbing. The specialty of Buckalew's machine is tbat it professes to do wrist-bands and bosoms successfully. Messrs. Lamb (the Novelty), Hollister, Lewis, Hawley (the Union), Whitney (the Isabella), Stockton and Mrs. Waldrin, also exhibit machines, wbich may be aeen in operation, and are not aatisfactorily to be appreciated without.

In His Cups.—A man employed as a packer in a crockery atore on Sansome street feli into a basket of China cups, yesterday, and hroke about four dozen.

Spicy.—Strong Pepper (wbite) has been appointed postmaster at Pepperville, Nebraska. All spice appears to he mustard in that office.

Put him out is what everybody said tbe other day when poor Tom Bibbin's spontaneously combusted. Tbey put him in—the grave, because they could not put him out.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Oct. 15, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

		Per ton.				Per ton
12	per cent. ore	$24 00	18	per cent. ore		$41 40
13	" "	26 65	19	" "		44 65
14	" "	29 40	20	" "		48 00
15	" "	32 25	25	" "		62 50
16	" "	25 20	30	" "		75 00
17	" "	38 25				

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

These prices, corrected by W. T. Atwood, we believe will be found substantially correct, and can be realized at this date.

ON A BUST.—Latest advices from Rome state that Miss Harriet Hosmer, the celebrated American sculptress, "is devoting all her abilities on a single bust." Some of the fast young gentlemen of San Francisco are less exclusive. They go on many.

A gentleman traveling on a steamer, one day at dinner, was making away with a large pudding close by, when he was told by a servant that it was dessert. "It matters not to me," said he, "I would eat it if it were a wilderness."

GAME of all kinds is scarce about San Francisco, except faro, euchre and poker.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

WANTED.—To rent a house of about six rooms, in a healthy location, near the business center of the city, for a gentleman, wife and baby. Will purchase or rent the furniture. Address X, box 17, P. O. San Francisco.

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

10v18 6m B. F. HOWLAND.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Use Pain Killer for Cholera and Bowel Complaints, for Bolt., Cuts, Bruises and Scalds, Old Sores, Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons,

Sore Throat, Sa en Colds, Congha, Etc.

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

A Family Medicine.—The PAIN KILLER is a purely vegetable compound, and while it is a most efficient remedy for pain, it is a perfectly safe medicine, even in the most unskilful hands. For Summer Complaints, or any other form of bowel disease in children or adults, it is an almost certain cure, and has, without doubt, been more successful in curing the various kinds of Cholera than any other known remedy, or the most skillful physician. In India, Africa and China, where this dreadful disease is more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a *sure cure.*

We have long known the high character of the PAIN KILLER, and that it is used with great success and satisfaction in our best families. It is the favorite medicine of our missionaries in heathen lands, where they use it more than all else together for the diseases that abound in those warm climates. It should be kept in every house, in readiness for sudden attacks of sickness.—*Chr. Press.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

KEOINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents

RETUARNED.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

DANIEL McLEOD, Secretary.
San Francisco, Sept. 21, 1869. s ec25-2w

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Globe.—*Miner*, Oct. 2d: The Supt. is pnshing ahead the tunnel as fast as possible to be ready with the ore on the arrival of the mill, soon expected here. They are in ledge matter now, but being on the west side of the deposit the ore is not yet of paying quality.

The Clear Quill.—From pockets of ore struck in the M. C. Tunnel No. 3, yesterday, we saw samples washed out which gave fully 25 per cent. pure sulphurets. This would make the ore worth at least $500 per ton, as these Tarshish sulphurets assay $2,000 and over.

Imperial.—Twenty-six feet of tunnel made last week, and nearly as good headway making this. This will soon bring them to the Florence lode.

Sold.—*Chronicle*, 2d: Davidson's quartz and saw mills, near this town, have been sold to an English company for $20,000.

CALAVERAS COUNTY.

Mosquito Gulch.—*Chronicle*, Oct. 9th: We are informed that the principal quartz ledges in the vicinity have been purchased by a company of New York capitaliets. They have started a tunnel that will strike their leads at a depth of four hundred feet, and will sink a shaft to intersect it.

EL DORADO COUNTY.

U. S. Grant Mine.—Placerville *Democrat*, 9th: This is eight miles east of this city and half a mile north of the Carson road. The Supt. informs us that they have completed an eight-stamp mill, and will commence crushing this week. The lead prospects from $10 to $40 per ton. They are down on the lode 23 feet, and have run drifts each way.

NEVADA COUNTY.

Vigilance.—*Gazette*, Oct. 11th: We learn that a quartz mill, constructed in Philadelphia for the company, arrived a few days ago at San Francisco. It is constructed on a new principle, the steam acting directly on the stamps. The building for the mill is completed, and the machinery will be set up without delay.

Ophir Hill.—Grass Valley *National*, 7th: We learn that the Graves Bros. have raised 200 tons of rock, and are having it crushed at Smith's mill. They estimate that it will pay $30 per ton.

Mohawk.—*Transcript*, 8th: This company, on Gold Flat, has been incorporated. Another engine will be put up, so that one will be used for hoisting and one for pumping.

Eagle Company.—The Eagle Co. are owners of the California mine, near this city, and the Grizzly, in Eureka. Dr. Beach comes ont for the purpose of ascertaining the condition of his company's affairs. We are told that on both sides of the incline, in the California, there is a large amount of pay rock, which was in sight at the time orders were received to shut down.

Columbia Hill.—The Union Gravel Mining Co., in which Nichols & Woodsides are principal owners, are fitting up their claims for work, having made arrangements with the North Bloomfield Co. for water.

The Kansas.—Same of 10th: Since the removal of the machinery to the foot of the hill for the purpose of sinking upon the gravel channel, the shaft has been sunk to the depth of thirty feet, when the water became troublesome. A pump will be put up.

About to Start up.—The owners of the Coe mine are making arrangements to recommence work on their mine.

Eureka.—Grass Valley *Union*, 9th: This company declared a dividend of $7.50 per share for the month of September, aggregating $30,000, which was paid in San Francisco yesterday.

McClellan.—Same of 10th: The company is prospecting the work on this mine in the most vigorous manner, and have a shaft down on a ledge over one hundred feet, substantially timbered. The ledge is of good width and shows heavily in sulphurets, which carry well in gold. The owners feel highly encouraged with the prospects.

PLUMAS COUNTY.

Argentina.—Quincy *National*, Oct. 2d: Heath & Co. have finished their new flume half a mile in length, 3 ft. wide, 18 in. high, and paved with rock—that is, rocks are used in the place of blocks or riffles. The company expect to take out big pay.

Coleman.—We were presented this week with some rich rock from the Coleman ledge. As the tunnel progresses the rock improves, showing considerable free gold. Old quartz men have prospected the rock on the dump, and in the ledge, and unite in saying it will pay upwards of $100 a ton. M. Smith & Co. have struck the south extension, which they are going to develop.

Struck It.—Loring & Cummings have struck rich ground in the back channel of the old Gloyd claims, at Elizabethtown, two miles from this place.

SHASTA COUNTY.

South Fork.—*Courier*, Oct. 2d: San Francisco parties have agreed to erect a quartz mill at Ludwig's Ranch, provided the South Fork ledge owners will obligate themselves to donate a certain number of tons of quartz. It is thought that the proposition will be accepted.

Rich.—Same of 9th: Assays of rock taken to San Francisco from the new tunnel on the Washington claim, French Gulch, yielded over $700 to the ton in gold and silver. The quartz is not rated as first-class.

Spring Creek Ditch.—The proprietors have workmen cleaning it out and repairing the flumes.

SISKIYOU COUNTY.

Big Valley.—Yreka *Union*, Oct. 2d: We learn that there is not much excitement at Ash Creek about the new mines. Quartz ledges have been discovered. Gold in small quantities is found in the gulches in the vicinity of the ledges.

Oro Fino.—This once fast mining town is unprecedently dull. The water failed several weeks earlier than usual.

Large Nugget.—Same of 9th: Townsend & Co. took from their claim, on Scott Bar one day this week a nugget which weighed 16 ozs. The company had been working sometime without pay, and were thinking seriously of abandoning the claim.

TRINITY COUNTY.

Canon Creek.—Correspondent of *Journal*, Oct. 2d: There are some 60 miners on the creek, scattered along a distance of eight or nine miles. Above the town of Cañon City the claims appear to be located higher in the hills, the low bars and bed of the creek having evidently been worked years ago.

YUBA COUNTY.

Mining at Brown's Valley.—*Appeal*, 12th: The Dannibroge mill has now been running three weeks on quartz from the Norfolk ledge, which is located about 40 yards west of the mill. The ore crushed has paid expenses. The mine is opened to a depth of only 30 feet.

Arizona.

England Gulch.—Prescott *Miner*, Sept. 35: Iager & Rogers took out last week $66 with a rocker. One piece weighed $35, another $5, and another $4.

Upper Hassayampa.—Several miners are at work, but they keep mum about what they are doing. At present, but little placer mining is being done, owing to the scarcity of water.

Quartz.—Rock is being taken ont of several ledges in Walker's and Agua Frio Districts ...The Sterling is "laid up" until water comes....Messrs. Heslop, Hitchcock, Gray, Wnnderlich and others, have gone to Big Bug District with the intention of starting the mill, should there be sufficient water....Davis & Taylor have sold an interest in their mines, wheel and arastras, to the Jackson Bros. The company are takiug very rich rock out of the Astor lode.

Yellow Pine.—The Visalia *Delta* of Oct. 6th announces the arrival home of a party of prospectors from "Yellow Pine and Clarke Districts, Arizona," and adds that the facts in its possession show "that the richest and most extensive body of mineral ever yet discovered in this continent is open to the view of any who choose to journey thither." The route from Walker's Pass is given in full to the mines, 153 miles. The editor is tempted by the specimens exhibited, and is bound to go himself.

Colorado.

South Pass.—Central City *Register*, Sept. 30th: John Conuors says there are two or three lodes which are paying well, but predicts terribly hard times there this winter.

Items.—Mr. Bradley is running the full capacity of his mill—22 stamps—on custom ore....We saw yesterday a retort of 8½ ozs. of gold, the result of two cords surface quartz from the Ingomar lode, a new discovery....The Golden Flint lode, owned by H. P. Brooks, of Gold Dirt, recently yielded under stamps 6 ozs., 15 pwts.,—about $145 currency ..... Chatillon and Smith, in the mouth of Sawpit Gulch, Russell District, are down 16 ft., and have a crevice of 18 inches of quartz of good quality....Munda and Robertson have leased the 16-stamp water mill at the head of Spring Gulch, and are running on surface quartz from the patch diggings on Quartz Hill.

Georgetown.—Charlie Lusk has presented us a very rich specimen of sulphide of silver from the Federal lode. The specimen will yield at least 75 per cent. of its weight in fine silver. One ton of ore was recently reduced from this lode that yielded 1,388½ ozs.—coin value, $1,740.05.

Middle Park Mines.—Denver *News*, 29th: We learn from Dr. Latham that these mines worked for the last year and a half, are now beginning to attract some of the attention they deserve. Ten to fifteen dollars a day to the man have been taken out. Six hundred dollars in nuggets of from $1 up to $20 from these mines is now on deposit at the first National Bank.

Idaho.

Potosi Mine.—*Wave*, Oct. 7th: We visited the mine on Friday. Free gold is visible in a large proportion of the rock on the dump, and it is expected that a few feet more will reveal something still richer, as they will then be under a portion of the ledge that is immensely rich on the surface. We saw rock taken last fall from the cut above the tunnel so full of wire gold as to cling together after being broken. The object in leaving the lower works and moving up the hill now is to get an opening into the ground while the weather is good.

The Ditch.—The Florida mountain ditch, from Long Gulch to the diggings, is all being excavated. Each claim owner has taken fifty rods to construct, and they are confident of being able to finish it this month. The ground is extremely rich in fine gold.

A. P. Minlar has bought the M. & M. Co.'s quartz teams, etc., and will remain here.

Wagontown Placers.—We are informed by parties interested that there will probably be between three and four hundred men employed in these mines next spring and summer. The pay ground extends twelve miles along Jordan creek, and some places the bars are quite wide, while in others the hills prospect well.

Sinker.—The mill started up Friday on Corduroy ore. They have out about three hundred tons at the mine of splendid looking rock.

Bullion.—The shipment from this camp to San Francisco by express for the month of September were small, amounting only to $69,000, coin.

Montana.

Gold Creek.—*New North West*, Oct. 1st: Companies have been working on the second bedrock, 12 ft. below the first, taking out as high as $1,200 to $1,800 per week to six hands. No one doubts now that the whole bar will pay. But not content with this, several parties have sunk through the second and found another bed of pay gravel. The bar at this rate is inexhaustible. All that is needed is water.

Philipsburg.—The James Stuart mill has been leased to Purvine & Trench for one year. The lessees receive $20,000 per annum. Purvine & Trench agree to at once replace the Wheeler pans. The new pans will cost $11,000. The firm is wealthy. The mill will do custom work for the present, parties having agreed to supply it with ores.

A nugget weighing $76, gold, was picked up on Connelley & Reynold's claim, up Pioneer Gulch, last week.

Rock Creek.—About the 1st of August, McKay, Pierce and Niles staked the Vulcan lode, on the west fork, one mile above its confluence with the east fork; and three weeks since were down 90 ft. Rock expelled from it yielded at the rate of $400 per ton. There are bar diggings discovered in the same vicinity that would pay $4 or $5 per day but no water can be had on them.

Nevada.

COPE DISTRICT.

Mill Machinery.—Elko *Independent*, Oct. 6th: The engine, boiler, pans, settlers, battery and complete machinery for the Drew & Atchison 10-stamp quartz mill, was loaded on teams for Mountain City, yesterday. The machinery is new, and was selected by experienced hands.

New Discoveries.—Bradbury, from Mountain City last evening, reports the discovery of new mines 20 miles east. The ore is rich, and the veins well defined. A new district will unboubtedly be organized. Everything in Cope is represented as looking better than ever.

Rare Specimens.—Same of 9th: Some of the finest silver-bearing rock we have seen, has, within the last few days, been brought into town from Cope. Fred. Hafford has received one chloride specimen weighing 52 lbs., which, it is estimated, will work $2 per pound. It was taken from the Mountain City claim.

HUMBOLDT.

Unionville.—Correspondent of *Independent*, same date: "The product of the two mines worked by John C. Fall & Co., and S. D. R. Stewart & Co., is greater than at any former time. The shipment of fine bullion for the month is about one ton, worth $15 per pound, making about $30,000 for the month. In addition to this, each company has shipped about 25 tons of rich ore, worth $450 per ton, making an aggregate value of $22,500, or a little over $50,000 per month, as a total product of the two mines. Both of the companies are hoisting ore to the surface faster than they can reduce it; hence an increase of stamps may be looked for before long. The new mill for the National mine, above town, started up yesterday. There are several other mines being worked in the district.

A Unionville telegram of the 13th inst., says: Rich ore has been struck in the Arizona mine, John C. Fall, Supt., and in that owned by the company of which D. R. Stewart is Supt. Great excitement prevails, it being the richest strike yet made in either. The National mill has commenced work on the gold ledge owned by the company.

MINERAL HILL DISTRICT.

Live Yankee.—*Independent*, Oct. 9th: Fred. Hutchins, just returned from the district, says that this company are constantly taking out rich ore, but have stopped shipping to Austin, on account of the expense of hauling so far. The boys have taken out money enough to run them through the winter, and now propose to wait until some man erects a mill. Several new lodes have been discovered north of the Hill. One of the companies, on a new discovery, will ship ten loads of ore to Austin next week. There is an abundance of timber and plenty of water. No better investment could be made than the erection of a ten-stamp mill. The ore requires roasting, and is worked by Austin millmen up to 85 per cent.

REESE RIVER.

Twin River Company.—*Reveille*, Oct. 6th: The works of this company will be put in order at once for the resumption of business. They consist of a well-appointed twenty-stamp mill, which is furnished with reverberatory furnaces. The Murphy, the principal mine of the company, has produced about a million of dollars. The revival of operations in Ophir Cañon will be an important event to Austin.

WASHOE.

Big Bullion Shipment.—*Enterprise*, Oct. 6th: From the office of Wells, Fargo & Co., in this city, there were shipped last evening 47 bars of bullion, valued at $112,000.

Sierra Nevada—7th: The clean-up made on the 1st amounted to $7,500, enough to pay the usual dividend. This mine has become a steady going institution. None of the ore pays very high, but the amount easily obtainable is almost illimitable. In this lies the great value of the mine.

Occidental—10th: Work is progressing favorably in the tunnel. A large stream of water flows from the tunnel, but there has been no great increase during the week. Within a day or two some new deposits of excellent ore have been found in the upper works. The ore in the new deposit assays $65.

Gould & Curry.—During the past week the amount of ore taken out daily has averaged 52 tons—principally through the lower tunnel. They are drifting north and south on the seventh station, along the line of the lead.

Yellow Jacket.—The work of clearing out the north shaft will be completed in about one week, and it will require five days to open up the connection between the north and south works. They are now extracting 145 to 150 tons of ore per day. This assays from $45 to $60 per ton, and will mill from $35 to $38.

Savage.—This company are down 30 feet below the 950-foot level. The rock is very hard. They are taking out from 50 to 80 tons of ore per day. Drifts are being run north and south along the ledge, and a winze is being sunk from the sixth to the seventh station.

Ophir.—The main drift, west from the bottom of the shaft is in 679 feet, and the branch drift, to the southwest, 133 feet. They are evidently approaching the ledge. They are having the stone cut for the foundation of a new hoisting engine, which is being constructed at the Union Foundry, San Francisco. The engine will be 70-horse power, and will be in operation this month. Their new boilers are already up.

Succor.—The old mine, situated near the Devil's Gate, ie now heing profitably worked. They aro taking out 30 tous of ore per day, which, worked hy gold process, yields $18 per ton, and pays a clear profit of $11 per ton. They reduco their ore at the Succor Mill, owned hy the company.

Hale & Norcross.—A uew station has been opened in the main shaft at the 1,100-foot level, and drifting will eoon he commeuced. The winze botween the 400 and 500-foot lovels bas heen completed, and the ventilation is now perfect in that part of the mine. The new veiu on the 400-foot lovel contains very fine oro. Ahout 170 to 175 tous per day of excellont ore are heing extracted.

Chollar-Potosi.—The new building for hoisting works is ahont completed. It covers the samo ground as the one hurned down, hut is not so costly. Thoir engines and other machinery will soon he ready to act up.

Lady Bryan.—They are taking out the usual amount of ore per day, which pays from $30 to $40 per ton. They have a six months' supply.

Virginia Consolidated.—Tho shaft of this company is down 330 feet. Tho rock is becoming softer, though hlasting is still necessary.

WHITE PINE.

Weekly Mining Review.—*News*, Oct. 9th: Practical mining is driving ahead with an impetus imparted by continued large shipments of hullion. The leadings companies have funds to defray the expense of enpplies of all kinds for the winter. Men who have heen accustomed to pay assessments for two or three years in a new silver mine, hefore thinking of a possihle return, have now figures in their White Pine experience, which show fair profits for the first season's work. The men of means, whose good opinion is worth something to us, make their opinions from the actual figures. More mills are wanted. Some are coming in before winter; one or two will he ready to strike up work within a fortnight; hut all the mille now running and all in course of building would do little more than clear the dumps, by February, if not another pound of oro were to he taken out within the intervening time.

Mills and Furnaces.—The same jonrnal goes on to enumerate the stamps running and to he run, so far as known. The total number in operation is given at 165, and some 30 more are named as in course of building. Smelting furnaces are multiplying. A good many who have claims in the Base Range and the foot of the Hill, are even putting in togetber for the erection of small furnaces. They huild, mostly, the common Mexican draft furnace with no blast. The Whi e Pine Smelting Works are running two furnaces, one of a capacity of 20 tons, the other 8, daily. The daily average of hullion is about 4 tons. This is worth, per ton, average, $50 in silver, $90 in lead. That is the lowest computation we have secn.

W. H. Prichard & Co., a San Francisco firm, are huilding six smelting furnaces in Mohawk Cañon, East slope of the Base Range. The company has a 20-horse power engine, which affords driving power for the hlast. Theso furnaces will he fired inside of ten days.

Hill's reverheratory furnace, at Swansea, will he going in a few days.

The *Empire*, of the 10th, makes the number of stamps in operation 181,—and in preparation, 80. Of the smelting works it says: According to the most reliahle data we have been ahle to glean, the Base Range furnaces have produced, the present season, in the neighborhood of 250,000 pounds of metal worth $120 per ton—$40 in silver and $80 in lead. Contracts have been made for its transportation to San Francisco at $40 per ton. Tho cost of mining and smelting is estimated to be $35 per ton, leaving a clear profit of $45 on each ton of metal produced. The common draft furnace, constructed at trifling expense, is mostly in vogue. Mosbeimer and some others, however, have introduced the hlast furnace, with all the modern improvements, and, as a general rule, this style is yielding the most satisfactory results.

Bullion.—*Empire*, 10th: It is impossihle to get the exact amount of bullion turned out weekly, as we have no returns from the Egan mill, the Monte Cristo mill, or Newark. Estimating the daily yield at $60 to the stamp, 181 stamps heing employed, we have $76,000 per week.

Items.—*News*, 9th: Aurora Consolidated takes out ore enough to supply two mille and accumulate on the dump, besides shipping bullion....Eclipse Consolidated has rich ore in the 112-foot shaft....Eherhardt putting ore in their mills as fast as teams can carry it. Only 20 to 30 men employed—all in ore....Noonday is in good ore....East Sheboygan makes a good showing....Hidden Treasure Consolidated shaft down 112 feet through the slate....The H. F. Rico, bas struck a fine vein of ore 150 feet west from the Pocotillo, in a shaft at the depth of 42 feet. Another shaft is hoing sunk 125 feet further west.

Items.—*Empire*, 10th: Consol. Chloride Flat ships 50 tons quartz to mill....Mammoth ships 8 to 10 tons....Oakland ships 12 tons. Pulp assays $160 per ton....Dayton mill has contracted to crush 600 tons of Original Hidden Treasnre ore.... Colleen Bawn made first shipment of ore to mill last Wednesday....Pogouip & Othello has more ore on dump than any other except South Aurora—about 1,000 tons.... Hannogan & Blasdell have purchased a large interest in the Idaho ledge....A large body of ore, worth $300 per ton, was struck in the Domingo mine on the 7th. The prospects are most flattering....Sam. Brannan's mill at Robinson, will steam up on the 20th....Fairchild's furnace is in operation.

Patterson District.—*News* 9th: Tho first hullion—that we have any account of—from Patterson District—came in this week: a bar of 437 ounces, from one ton of rock from the Rob Roy ledge. Garish is arranging to build a 20-stamp mill, and a portion of the machinery is already on the road. Machinery for use in Eley and Shoshone districts, also is on the way. The road lies through Patterson.

New District.—*Empire*, 10th: From Albert Gmelin, who just returned from Secret and Sierra Cañons, we learn that several excellent mines have been opened in both, and that a new district will be organized at once. Secret and Sierra Cañons are in Lander county, four miles apart, and forty and forty-four miles distant, respectively, from Hamilton, in a westerly direction. There are forty-five men there. Mr. Basey sent twenty-five mule loads of ore to Austin. It worked satisfactorily. Assays of Secret Cañon ores range from $37 to $400 per ton.

The water was turned into Treasure City on the 9th. The *Empire* says it is seldom that ten words convey so much as those ten. It has heen a tremendous labor, and is magnificently accomplished.

Oregon.

Nehalem Valley.—Cor. of *Oregonian*, Oct. 2d: "The Nehalem River is 200 feet wide, with rapids from one to five miles apart. The bottom is solid sandstone. We found several ledges of hard sandstone, excellent for huilding purposes. We also found a large ledge of iron, some gold and silver-hearing quartz and a small vein of copper. We found several pieces of coal that had washed down and lodged on the har of the river, which burned very readily in our camp fire; also a ledge of coarse oil-stone."

Utah.

Ore Shipped.—The Salt Lake *Telegraph* of the 30th ult., says that 20 tons of ore were shipped recently from the mines of Little Cottonwood to San Francisco. A week before, 10 tons were also shipped from the same point.

One of the Visitors to the Fair.—Persons who attend the Fair early in the afternoon may frequently see a small hoy, ahout 14 or 15 years of age, who is afflicted with club feet. There is otherwise nothing peculiarly noticeahle about him. But we venture to think there will he soon. This poor boy, who was educated at one of our public schools, is an excellent mathematician, and daily visite the Fair to examine a certain complicated machine on exhibition, of which he has nearly completed a working model, with several important improvements. Those who have seen bis work pronounce it a marvel of mechanical ingenuity; and when its object shall be made public, it will certainly create a sensation. Such cases as this afford a strong argument in favor of Free Schools and Mechanics' Fairs, and the example of this poor deformed hoy, we hope, will be followed by many of the bright little fellows who visit the Fair.

The News.—Everybody wants to learn the latest news in these fast times of telegraphs, lightning trains, and high-pressure steamers. W. E. Loomis, corner Sansome and Washington streets, to keep pace with the wants of his patrons, has increased his facilities for obtaining the news from all parts of the world. At his store, scientific and miscellaneous newspapers and magazines may be had in all languages, of the latest date and at the lowest prices.

Collins' Oscillating Quartz Crusher.

Mr. John A. Collins exhibits a working model of an oscillating quartz crusher, which has been devised to overcome hy an economical use of power, the main difficulty encountered in quartz crushing—that of getting rid of pulverized quartz as fast as it is reduced to a sufficient degree of fineness. The model exhibited, though having tho appearance of being quite complicated, is nevertheless really simple in its construction.

The crushing is produced by the oscillation or rolling back and forth of an iron wheel, under a pressure of several hundred times its own weight, on an iron hed-plate, walled up on either side, so as to take tho form of a trough, open at hoth ends. The quartz is fed, first upon one end of this trough, and then upon the other, while the wheel is made to alternately pass over the same. A suitahle device is affixed to remove all the quartz from either end, immediately after each passage of the wheel, discharging it into a rotary screen, which deposits that reduced sufficiently fine into one apartment, while the coarser finds its way, automatically, into another, from whence it may he again elevated, automatically or otherwise, to the feed platform. By this arrangement no power is uselessly exponded on work that is fully completed; an entire new charge of quartz heing presented for every movement of the wheel. The power required to drive the wheel is reduced to its minimum by an ingenious use of anti-friction rollers. The crushed mass can he reduced to any degree of fineness hy the employment of finer or coarser screens.

If the practical observer will imagine the above described operation, which is even more simple than ordinary stamps, he will have precisely what is shown in this model divested of its automatic feed attachment. The crushing of a piece of quartz hy causing a heavy wheel to pass over it on an even iron floor, is probahly the most economical use of power in that direction which can be devised. The cause of the failure of this principle, as applied in the ordinary Chili mill, is owing to the practical difficulties in the way of effecting a ready discharge. The device of Mr. Collins appears to have provided a full and efficient remedy for this defect. The plan is certainly worth the attention of millmen, and we trust some party will be found possessed of the requisite means and having sufficient confidence in the idea to give it a practical trial. Col. Collins has labored long and earnestly in working up this idea, and we trust he may yet reap a rich reward for his ingenuity and perseverance.

The Colonel also exhibits an oscillating cylinder, for either wet or dry crushing, which, if desired, can he made to take the place of the wheel already described, and do double duty, by more finely pulverizing and amalgamating a charge inside, while performing the crushing process already described by its outer circumference.

Small.—There are some members of the San Francisco press, who appear to be desirous of bringing the profession of reporter down to the lowest possihle point of degradation. One of these individuals was last night invited with others, by the Managers of the Fair to accept a friendly glass of wine and a mouthful of cake, as a mark of the Managers' appreciation of the services of the press. After drinking the wine, eating the cake and pocketing the cigars thus generously tendered, this individual took occasion to publish scurrilous remarks about the Managers of the Fair and the reporters of the press. Such conduct is superlatively disgraceful.

The California Building, Loan and Savings Bank allows one per cent. per month on all six months' deposits. The earnest work which its President, Thomas Mooney, has done for the institution during the past few years has made it popular, and benefitted thousands of laboring people. It now holds a prominent position.

Professor Slingdechisel, who is here on a visit, says that the understanding of the California-raised ladies is better at one end than it is at the other. He thinks there is not sufficient at the upper end, and a little too much at the lower one. Feet, you know, are all the rage in California.

Copper Smelting in Alpine County.

An important work is under way in the hands of Mr. Rickard, for an English company working one of the copper lodes near Mentler, Alpine County—no less than the erection of a large sized hlast furnace, at that place, for reduction of copper pyrites, ores of which exist in great quantity, and with facility for mining. Mr. Rickard is an old copper smelter, having had experience in Chile and elsewhere. It has been a matter of surprise that in this country, where we can boast many first-class copper mines, nothing has been carried through in the way of reduction, so as to turn our rich deposits to account. Chile has rich copper mines, hut not any richer than California, Nevada and Arizona, whose mines remain undeveloped.

Fire-brick are obtained, of English manufacture, at $40 per thousand. A root-blower, of the largest size, like that on exhibition at the Fair, bas already been sent up; and 12,000 bushels of charcoal have been contracted for at 20 cents per bushel. A large number of men are now at work burning charcoal, and hastening to complete the job before the winter months set in. The vein is eight feet wide.

Generous.—At an informal meeting of the Board of Managers of the Fair, held last night, it was proposed to offer the use of the Pavilion to the managers of the Mercantile Library, for the purpose of enabling them to hold a fancy fair and promenade concert, in order to raise funds to help the library out of its present pecuniary difficulties. The suggestion is an eminently practical one, and with the aid of the managers of the present Fair, may be made to pay from $20,000 to $30,000 to the library fund. The offer is generous, and we hope will he accepted.

Cashmere Goat Skins.—Placed against the wall near the southeast corner of the music room, may be seen four bright-stained skins, exhibited by Mr. Henry Brook. Their history will no doubt be interesting to ladies, for they are the product of animals which yield the celebrated fiber from which the world-renowned cashmere shawls are manufactured. The specimens now on exhibition were bred and reared at Latrobe, Sacramento County, by Mr. Thomas Brook, and are the first of the kind ever exhibited in California. As these skins are inaccessible to the touch of the visitor, without the aid of steps or a ladder, the exhibitor, in order to gratify such as may feel an interest in contrasting the great difference in the quality of the fiber of the casbmere goat and ordinary sheep wool, has considerately placed upon the counter below the nearest window, two small ordinary stained sheep rugs, with cashmere goat fringes, where they are within easy reach. The contrast between the two is very great. These skins were on the backs of the animals at the opening of the Exhibition.

Stained California Sheep Skins.—To the east of the preceding, are placed six California sheep skins, also dyed and manufactured hy Mr. H. Brook. We pay annually no inconsiderahle sum to France and the Eastern States for articles of this description, for use as buggy, parlor and bedroom rugs. It is gratifying to see that for all these purposes we can in future be supplied by our own growth and manufacture. At the reduced prices at which we are informed they can in future be supplied, if the home manufactured is patronized in place of foreign importations, these comforts would be found attainahle hy miners and others, to the great benefit of the health of the occupants of shanties in the high Sierras, during the inclement season. Had we space, we could point out many useful purposes to which the miner could apply these skins.

A New Sulphur Acid.—Prof. Schutzenberger has discovered a new acid having the composition SO, HO. He calls it hydrosulphurous acid; hut *Scientific Review* saye it is undoubtedly the true hyposulphurous acid, analogous to hypophosphorous acid, etc. Thie term, however, is unfortunately employed for another acid, the composition of which bas of late given rise to some discussion. It is formed when snlphurous acid is placed in contact with zinc. "It possesses reducing qualities equal to those of nascent hydrogen; it bleaches indigo and litmus almost instantaneously; it forms a characteristic salt with soda."

San Francisco:

Saturday Morning, Oct. 16, 1869.

Notices to Correspondents.

J. E. S., San Francisco.—*Tri-section of an Angle.* This problem as eolved is interesting and undoubtedly correct. But it would be as easy to solve and demonstrate the same hy the use of a pair of compasses as hy a square; involving in hoth cases a mechanical applicatiou which appears to us inadmissible in geometrical reasoning. For carpenter's use, and for all practical purposes, we tbink the triection of an angle is satisfactorily solved in the manner described.

A. J. M., San Francisco.—*Squaring of the Circle.* Benson's method appears to us faulty in proceeding upon tbe deduction that the solid content of the inuer half of the cylinder generated, as measured by tbe inner half of the radius, is equal to tbe cubic content of outer half, wh ich ie obviously not the case.

"Old Mac."—The definitions of all the words which you name are given in full, together with their derivations, in "Wehster's Unahridged."

Hortas, Stockton.—Your query with regard to the California Pepper Tree, so called, will he fully answered next week.

Personal.—Mr. A. B. Paul wishes to have it understood that he is not the gentleman of the firm of Rickard & Paul, the latter heing a Cornish miner, resident iu Londou, the European agent of Mr. Rickard. * * * Mr. Ryerson, the inventor of the amalgamating process, in use on the Mariposa estate, is in town and busy. * * * Deetken, of Grass Valley, has returned from his European trip, with new ideas. * * * Three Englishmen of note in the mining way,—Mr. Salmon, Mr. Barrett and Capt. Batters—who have been stopping in San Francisco for a week, have sailed for Belmont, Nevada, in tow of Col. Buel. * * * Messrs. Caswell and Hodges, mining engineers, have been visiting and examining the mines of Colorado and Nevada iu a tour of eleven weeks. * * * E. R. Howe, late of the Pomeroy O. Iron Works, is iu towu, *en route* for Arizoua.

Petroleum as Fuel for Cupola Smelting.—During several weeks past an inventor under the patronage of a Mr. Grunhaum has been engaged in experiments to smelt galena, in a cupola furnace with petrolenm as fuel. He introduces vaporized oil in jcts at a dozen or more points, into the smelting zone; the furnace being in principal of construction like Sefstrom's assaying furnace, double, tbe outer enclosure in this case being for vaporization of oil mixed with air, while Sefstrom's object was only the warming up and distribution of his air hlast. We are not able to speak advisedly as to the working of the process, not having witnessed the trial, but understand that the results were partially satisfactory. Further experiments are to be made in one of the smelting works of this city.

Age and Depth of the California Valley Alluvium.

Tbere was a time, and that was during the deposition of the auriferous slates of the Mountains, away back in the Jurassic Age, when the Great Ocean washed unobstructedly to the feet of the granite Sierra Nevada. Tbe muddy sediment that afterwards became bardened to slatcs, rose out of the ocean with the rising western part of the Continent—a fact needing no stronger proof than the circumstance tbat they are at present *not* under water. A series of subterranean ridges next began hulging up "off the coast," in tbe Cretacous Age, and during the Tertiary period these also lifted themselves out of the waters, becoming the Coast Range. The Tertiary, Cretaceous and Jurassic are tbe last three great subdivisions of Geology.

But Sacramento and San Joaquin valleys, instead of rising with our hills of tbe Cretaceous and Tertiary ages, sank, in the method and manner of corrugation which is so cbaracteristic of the world's physical geograpby. Compress the edges of a sheet of paper, and it will be seen that while a ridge rises in one place, there is a corresponding depression, of equal but inverse corrugation, in another.

How deep tbe alluvium of Sacramento and San Joaquin valleys may be, has never heen ascertained, and probably never will be by actual digging, or horing, since water level and the most ample supplies of artesian well water, under great pressure, can be obtained at a few hundred feet. Wells have been dug to 100 feet, and bored to 350 feet depth in many localities in the great valley, without striking anything in any case more solid thau "hard pau," sand, and layers of gravel,—along which waters percolate—the drift very evidently of tbe Cretaceous and Tertiary hills adjoining the valley.

The age of this drift is more positively determiued by the recent finding of a fosoil elepbant at the bottom of a well dug in the central part of San Joaquin Valley, by W. F. Brown, Esq., eight miles south of Banta's Station, on the Western Pacific Railroad. For the facts, and specimens of a tusk and soil where the body of the elephant still lies, we are indebted to the courtesy of Mr. S. H. Herring, the horticulturist. These epecimens can be seen at the Fair, under the head of Soils and Tertiary Fossils iu tbe systematic collection in the Mining and Scientific Press compartment. At twenty feet the well-diggers left tbe clayey soil, and struck a layer of gravel ten feet thick; at forty-five fcet another layer of gravel; then clay, to a deptb of eighty feet, where the specimens were met witb in a third layer of clayey gravel, as exhibited. It may be presumed that the depth of the valley alluvium to bedrock is eqnal to the average height of tbe Coast Range, say 2,500 fcet. At Marysville, at Stockton, and at San José, the well diggers and artesian borers report, however, tbe same regular alternation of clays, sands, and gravel to the greatest depths; the latter being at Marysville "wash gravel" to a depth of at least 100 and 200 feet, while our specimen consists of small quartzose fragments but partially rounded.

The elephant and mastodon found so numerously in tho deep placer mines of the State, and not unfrcquently in association with humau relics of the "Stone Age," belong to the Post-tertiary Period, the exact geology of which is unusually interesting in California, as showing the earliest kuown existence of the human race upon the face of tbe globe.

A Good Thing to Have in the House—A policy from $5,000 to $10,000 in a secure Life Insurance Company. No man with a family or without one should neglect to have his life insured. The Connecticut Mutual is among the safest and best companies iu which to make such au iuvestment. *

Winn's Patent Shampooing Apparatus.

By the use of the apparatus here shown, the unpleasant mode in which the operation of shampooing is usually performed, is converted into a neat and tidy process, very effective and decidedly agreeable. By the aid of this apparatus, the head is washed and scrubbed in a hath of water, of any desirable qnantity or temperature, and the employment of which, upon the top of the bead, is productive of the most delightfully agreeable sensations, such as impart an entirely new feature to the process of shampooing. The apparatus is tasteful as well as substantial in its construction; and its use is equally as effective when applied to the long, flowing hair, as worn by the ladies, as to tbe shorter hair of gentlemen's wear.

To form this apparatus, a rim or bottomless pan is first constructed, with a gutta percba lining so devised and provided with an elastic strap, as to fit tightly around the head, below the principal part of tbe hair. Tbe drapery or curtain, which is seen to fall below the rim, is both for ornament and use; it serves to conceal from view the somewhat unsightly straps, lining, etc., which form the water-tight joint between

the bead and apparatus thereto applied, and a subsequcut elastic gutter, which is strapped tightly about the head, at the extreme lower part of the hair, to catch any water which may possibly escape from the main apparatus. As seen in the engraving, each has a flexible tube appended, by which the water may be carried off to a sink or other suitablo receiving vessel, so that the person will have no occasion to leave his seat during the entire operatiou, or even to remove his neck-tie.

The soap-suds or any other shampooing fluid which may be employed, is poured upon the top of the head, within the rim, after it has been properly adjusted, and a brush or mop, or sponge, or any otber suitable instrument, is theu employed witbin the body of the liquid to clean the bead and hair. The liquid is readily discharged through a stop-cock and the tube shown in the rear, and fresh water for rinsing applied, as often as may be desirable. Standards, with curved rests or supports, placed upon the shouldere, and adjusted by screws upon the top, all shown in the engraving, are affixed for the purpose of taking the weight of the apparatus and a portion of the weight of the water from the head. The flexible rim which adjusts the apparatus to the head makes this device practicable.

Previous to putting on the rim an elastic strap is placed around the bead to hold up tbe bair intended to he included witbin tbe rim, when it may be properly washed and cleansed. Tbis arrangement is particularly useful and indispensable iu fact, in shampooing the head of a lady with flowing hair. This combined apparatus renders the process of shampooing as easily and as readily performed for a lady as for a gentleman. Mr. M. L. Winn, of this city, tho inventor and patentee, exhibits his apparatus and the practical employment of the process, iu a booth near the east entrance of the north upper gallery of the Mechanics' Pavilion. The patent for the U. S. was obtained by the M. & S. Press Patent Agency, through which European patents are being secured.

We are assured by the inventor that all who have been favored witb sbampoo by means of this new apparatus, are unanimous in the expression of the higbest encomiums upon it, in every particular. One lady remarked, when the apparatus was being removed, tbat she would leave the best dinner ever spread, for the enjoyment of such a luxury. An intelligent barber to whom it was first exhibited, after a critical examination and test, remarked that it was a complete instrument for the purpose intended. It is confidently expected tbat the introduction of tbis apparatus will largely increase this branch of tbe barber's business. A saloon will soon be fitted up on some one of our city thoroughfares, when the public will have tbe pleasure of testing its usefulness, each one for himself, and then the article will be on sale and rights disposed of.

Wet Crushing Without Loss.

Mr. Partz, of Oakland, has devised a very simple method of accomplishing this important result, where but little or no concentration is necessary, down as far as the process of amalgamation in tbe pan. He merely uses tbe same water over and over again, which is pumped back, to the stamp mill.

Tbe advantages of amalgamation in battery for separation of coarse gold, are thus first reaped; then the pulp flows into tanks (intermediate hlankets or otber concentrating contrivance not necessarily interfered witb) of a number of compartments, in which the ore separates and sizes itself into as many qualities as may be desired. When one set of compartments gets filled with amalgamation matter, the other is used, and the contents of the first are worked up in the pans.

As it has been found that float gold will disengage the particles of air or water gae which make it huoyant, when heat is applied to 100 C., Mr. Partz next conducts a steam pipe into the tank, to heat up the material before amalgamation; effecting thereby besides, the well knowu chemical acceleration of tbe application of beat in the succeeding process. Mr. Partz maintaine that but 30 per cent. of the gold, and about 60 per cent. of tbe silver in our ores, are usually saved. Certainly the simple plan of saving the water is as easy to try as it is adaptively hit upon; and it must be effectivo as far as it goes. Where, however, the quantity of gangue is large, and systematic concentration is necessary before metallurgical treatment will pay—except for saving of float gold—the advantage of returning the water is not so obvious. A careful worker would doubtless find, on trial, that there is many a case where the water could he saved to purpose. On the other hand, there will be the drawback, if it should prove to be a drawback in practice, of working with impure water in the process of battery amalgamation, which might diminish somewhat the product of that method of treatment.

Foster's Substitute for Brass Hinges. Mr. C. H. Foster exhibits at tbe Pavilion a substitute for brass hinges, in which he galvanizes tbe common iron hinge, employs a brass instead of an iron pintle, and bushes the eocket in which the pintle works with sheet brass. By tbis improvement he claime to save 100 per cent. in cost of manufacture, durability and strength over the common brass hinge. These hinges have heeu extensively employed upon steamers on this coast, and are fouud to possess all the advantages of the brass at a cost but a trifle above that of the iron hinge. Samples of these hinges may be seen on tbe end of a bench near the central entranco to the machinery department; and they may be obtained of Linforth, Kellogg & Rail, No. 5 Front street. A patent for this improvement in the manufacture of hinges has been obtained through the Mining and Scientific Press Patent Agency.

Conducting Capacity of Water Pipes Expressed in Miners' Inches.

C. G., of Oro Fino, inquires :

How many inches of water, *miners' measure*, will a pipe of eleven (11) inches in diameter, conduct over a "gap" two hundred (200) feet in height, eighteen hundred (1,800) feet long, measured along the supposed track of the pipe, with twenty-five (25) feet of pressure—*i. e.*, the altitude of the point of entrance is twenty-five (25) feet higher than the point where the rock debouches from the pipe?

If you obtain the amount discharged under a simple head of 25 feet, you will have the answer, *minus* the friction that occurs, down hill, and up hill, in your pipe of 1,800 feet length. The common rule to determine the velocity of water per second, flowing through long pipes; the head or height of reservoir above the point of delivery, the length and diameter of the pipe being given, is as follows :

Multiply the product of the head and diameter of the pipe in feet by twenty-three hundred ; divide this product by the sum of once the length and fifty-two times the diameter of the pipe, and extract the square root of the quotient.

Example.—The head is six hundred feet, the diameter of the pipe nine inches, the length of pipe six thousand feet What is the velocity of the water per minute ?

Calculation.—Diameter of pipe = 9 inches = .75 feet.

Product of head diameter, etc., $600 \times 2300 \times .75 = 1035000$.

Sum of length and product, $6000 + (52 \times .75) = 6039$.

Quotient, $1035000 \div 6039 = 171.386$.

Square root, $\sqrt{(171.386)} = 13.09$ feet velocity per second.

Velocity per minute, $13.09 \times 60 = 785.4$ feet. Ans.

Having obtained the velocity per second in feet or inches, the same can be compared with or reduced to miners' inches, (under a head of six inches) or any other head, by the following table :

Let H = Head of water, in feet.

V = Theoretical velocity of water, in feet per second.

v = Ditto, ditto, in feet per minute.

H	V	v	H	V	v	H	V	v
1	8	482	15	31	1866	65	65	3886
2	11.3	681	16	32	1928	70	67	4032
3	13.9	835	17	33	1987	75	69	4174
4	16	964	18	34	2045	80	72	4311
5	18	1078	19	35	2100	85	74	4443
6	19.7	1180	20	36	2155	90	76	4573
7	21	1275	25	40	2410	95	78	4698
8	23	1363	30	44	2640	100	80	4820
9	24	1446	35	47	2851	125	90	5389
10	25	1524	40	51	3048	150	98	5903
11	26.5	1598	45	54	3233	200	113	6816
12	28	1669	50	57	3408	250	127	7621
13	29	1737	55	59	3574	300	139	8348
14	30	1803	60	62	3733	350	150	9018

The practice of the watermen is to consider a miner's inch equal to 1,200 cubic feet per day of twelve hours, which allows what is practically necessary for leakage. By the first rule above, the result is obtained in feet per minute. Multiply that by the number of minutes in a day, and dividing by 1,200 will give the number of miner's inches per day. Other very good working rules and tables are given in Weisbach and in Danbisson. Application to the Secretary of the Excelsior Canal Co., in Yuba county, or some similar old water company, is suggested for the solution of further practical points.

Special Compliment.

Messrs. Dewey & Co., *Patent Agents*—Gentlemen :—Allow us to express our thanks for the gentlemanly, prompt and business-like manner in which you have conducted our business before the United States Patent Agency at Washington, D. C. We believe that inventors on this coast will materially advance their interests by patronizing your Agency. The Reversible Door Butt and Double-Acting Blind Wiring Machine cases were hardly forwarded from your office before we were notified of their having been allowed.

Jefferson Kindleberger,
William A. Arnold.

"Do you believe in the appearance of spirits, father?" asked a rather fast young man of his indulgent sire. "No, Tom, but I believe in their disappearance, since I missed my bottle of Bourbon last night," replied the old gentleman.

Krom's Dry Concentrator.

This machine is in progress of trial in Colorado, and is said to be doing unexpectedly well, in view of the novelty of the principles employed. It is a jigging machine, in which the element of air takes the place of water. The greater difference of specific gravity between that element and the ores to be sorted, the circumstance that bubbles of air attach themselves to different kinds of minerals in water in different degree, rendering their apparent specific gravity less than the real, is not a difficulty encountered in the dry concentrator ; and the further very important advantage that nothing can be lost in the stream, are reasons sufficient to make it desirable that those experimenting with Krom's machine should perfect the application of the principle to its utmost, for use in some Nevada and Arizona mines under conditions to which it may be best adapted. Instead of water, it is air that is forced up through the jigging sieve, in successive impulses given by means of a bellows ; and, theoretically, since heavy objects fall quicker in air than in water, the blows can be more rapidly repeated, and the amount of work done be proportionately increased.

Lloyd & Stewart's Improved Anchor.

A beautiful model of Lloyd & Stewart's improved anchor may be seen at the Daily Fair Press stand, in the Pavilion. The object of this invention is to provide an anchor which shall do away with the awkward *stock* or cross-piece of the anchor in common use; and at the same time provide a device which cannot be "tripped," by becoming "fouled" with the chains, and which shall also admit of a decrease in weight of metal without losing anything in its efficiency as an anchor. Another advantage gained by this anchor, arises from the fact of its better stowage, and the further fact that it will hang more nearly over the ship's side. An improvement has been added to the model now on exhibition which has not been shown before, and which consists of a slight projection from each side of the palms of the shank, whereby the anchor takes more readily on a smooth bottom, than when employed without such projection. This anchor has attracted favorable attention for a year or two past. It was patented in July, 1867, through the M. & S. Press Patent Agency.

Among Bayley & Winter's photographic *chefs d'œuvre* we notice some fine specimens re-touched in India ink, the most striking of which is a life-size picture of Thomas Maguire; also, some fine water color pictures. But the best picture of the display is the new style of picture called the "Oleograph," the peculiarity of which is in the coloring of the face in water colors and the balance in oil, on what is termed albumen paper. These pictures have commanded considerable attention ever since the Fair opened, and have brought forth many encomiums. The most beautiful is that of a little girl in clouds; there is in it a delicacy, richness, fine relief and naturalness, which is very pleasing. Senator Carl Schurz stands most conspicuous, and is pronounced by his intimate friends natural and life-like. Other pictures of the same character might be dwelt upon for the peculiar merit attached to this new style of coloring. Those who have not inspected them are little aware of what perfection the art of photography and coloring combined have obtained. Bayley & Winter's Gallery is on Washington street, next door to Maguire's Opera House, where all the attention is paid to their customers to secure them a fine picture.

"Throw Physic to the Dogs"—Would be very good advice if people could do without medicines, but as they cannot, it becomes a very important question where to obtain pure drugs and patent medicines. J. A. Bauer, 101 Post street, makes all kinds of chemicals and compounds medical prescriptions with pure drugs. Having been in business in this city since 1849, he has a larger experience than any other druggist. Mr. Bauer is a very experienced chemist and an experienced expert in his profession. He has just moved into his new store.

Howe's Improved Scales.

Reliable standards of weight are of great importance in every community. For many years the Fairbanks' scale appeared to out-distance all others in popular favor; but of late the Howe scale, manufactured in Brandon, Vermont, seems to be gaining ground. Over 4,000 of these scales have already been purchased by the U. S. Government. They are in use on nearly all the principal Eastern railroads, and are fast finding their way into favor everywhere. They are exhibited near the western extremity of the machinery department at the Mechanics' Pavilion, where hundreds of visitors are weighed every day. Over 17,000 people have been weighed on one of Howe's standard warehouse scales, which is still in as good condition and as accurate in its work as when first used. V. S. W. Parkhurst, 305 Montgomery street, corner of Pine, is the sole agent for these scales on the Pacific Coast. Their construction is extremely simple. The platform rests on chilled iron balls, which prevents abrasion or wear to the pivots or knife edges. These balls are not connected with the weighing parts, and can be entirely removed without affecting the scale. In hay and other large scales, no pit is needed; and it is claimed that these are the only scales which will weigh correctly out of level, or can be used on a side hill or other incline. They exhibit no variations when heavy weights are moved from the center to either extremity of the platform, as it is claimed, is the case with all other large platform scales.

Mr. Parkhurst, as above, keeps constantly on hand a large variety of these scales, portable and otherwise, suitable for the railroad depot or track, the warehouse, grainery, rolling mill, the counter, or the post office. Warehouse scales are furnished either portable or dormant.

New Publications.

Fifth Edition of Hittell's Resources of California.

A. Roman & Co. have just issued the fifth edition of this very useful work, with additional matter, contained chiefly in an appendix of forty pages on Oregon, Washington and Nevada. The introduction gives a brief review of the features in which California and the neighboring States have made their most marked advances since the issuance of the previous edition in 1868. Mr. Hittell's succinct and very acceptable style of conveying his information, renders the work not merely valuable, and indispensable, but entertaining and instructive to every dweller on these shores. The price is $1.50. We suggest to the publishers that a good and cheap map of the State, containing original features if possible, bound into the next edition, and sold for about $2, or $2.50, would multiply greatly the value of the book, and would prove profitable to them.

John and the Demijohn; a Temperance Tale, by Mrs. Julia McNair Wright. Boston: Henry Hoyt.

This is a pleasant boys' and girls' story, inculcating temperance principles, yet in an entertaining manner. It is just the kind of book that makes character, and such as should be put into the hands of boys and young men exposed to the examples of dissipation and intemperance. Illustrated. For sale by A. Roman & Co.

Wife was undressing little four-year-old Charley the other evening. He silently felt of his chubby arms a little while and then looking up into his mother's face, he said : "Mamma, who made me?" "The good man up in the sky," answered mamma. Charley turned a steady, sober, searching look through the tree-tops into the clear beautiful, star-lit sky for a moment, and then innocently capped the climax with the important question: "But, mamma, who took me down?"

A Curious Fact.—Jones says that he has never seen a bright, cheerful, good looking woman advocating womans' rights. Such women get all the rights they want. It is only your crabbed-odd-cross-grained-sour-angled-faced-contrary-made of the sex who can't get the rights they want, and don't deserve to. The reader must remember that Jones is an inveterate old bach.

A little boy, in giving an account to his brother of the Garden of Eden, said: "The Lord made a gardener, and put him in the garden to take care of it, and to see that nobody hurt anything or posted bills on the trees."

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For the Week Ending October 5th.

Sluice Box.—D. F. Hawks, Timbuctoo, Yuba County, Cal.

Gang Plow.—H. N. Dalton, Pacheco, Cal.

Hoisting Machine.—William Eppelsheimer, San Francisco, Cal.

Rock Drill.—Charlton H. Davis, San Francisco, Cal.

Pianos on the Pacific Coast.

No State in the Union, according to its population, buys so many pianos as does California, and large numbers of the best Eastern made instruments are being constantly imported to meet the increasing demand.

Mr. Edward F. Pierce, at 228 Sutter street, in this city, is doing a large business in this line, being sole agent for Weber's, Hallet & Cumston's and Miller's pianos, and for Smith's parlor organs. All pianos sold from Mr. Pierce's warerooms, are imported by him direct from the manufactories, and are fully warranted to remain perfect in any climate, moist or dry. The Hallet & Cumston has long been recognized on this coast as the favorite piano, where a moderate priced first class instrument is desired.

Smith's parlor organs have also established for themselves a reputation here, and the following letter from the leader of the Boston Peace Festival, will show the estimation in which they are held in the States :

"Messrs. S. D. & H. W. Smith—*Gentlemen :*—My attention was particularly called to your American Organs by one which was used in the public performance recently of the oratorio of the "Creation," under my conductorship. It rendered valuable service in the support of the choruses and accompaniments of the recitatives.

The purity and sweetness of tone was excellent, and I was especially struck with the great power of the sub-bass notes. This has led me to make a careful examination of your different styles of organs, and the interior workmanship at your manufactory.

The quality of tone bears the closest resemblance to the pipe-organ ; and I cheerfully testify to their great superiority in this respect, as well as in the finish of the mechanical parts. Carl Zerrahn."

The Weber piano is as yet new to this coast ; but its reputation at home has induced Mr. Pierce to pay a high price to secure it for California. In New York City it is rapidly taking the lead over other instruments, and is the favorite concert piano. The following quotation is from Watson's *Art Journal:*

"Twelve-months ago the Weber Grand Pianos dawned upon the public, and now they rank with those of the first makers, played upon by the most eminent artists at the best concerts in New York and other cities, and at the series of concerts given by M'me Parepa-Rosa and Miss C. Kellogg, during their extended tours through the United States. It will be acknowledged, we think, that, considering the brief term of their existence, the Grand Pianofortes of Albert Weber have created a greater and wider sensation than those of any other maker. His square pianos have so long held a brilliant reputation, and continue to speak for themselves, that they need no further commendation from us."

"You have lost some of your friends, I see," said a traveler to a negro whom he had met on the road. "Yes, massa." "Was it a near or distant relative?" "Well, purty distant ; 'bout thirty-four miles."

A little boy out West was asked if he knew where liars went, and answered yes—they went to New York to write for the papers.

An Irishman complained to his physician that he stuffed him so much with drugs that he was sick for a long time after he got well.

A couple of doubtful females were arrested yesterday. One was Miss D. Meen Orr, the other was Miss D. Moral Ized.

The lick-her question—shall a man be allowed to whip his wife?

[From the Mechanic' Fair Daily Press, Oct. 11.]

Pacific Saw Manufacturing Company.

Tha display mada by this firm, (composed of C. P. Sheffield, N. W. Spaulding and I. Patterson), is worthy of spacial attention, being one of the leading displays of tha Fair. It is an extensiva arrangement of aaws, etc. Circular saws from one inch to nearly six feet in diameter, and hand, cross-cut, and mill sawa, from 14 inches to 12 feat in length, and so placed that a very excellent design of a steam engine and othar figures have been formed. It would be usaless to make allusion to any particular part of thair exhibition, it is of so varied a nature, embracing saws of every description. Saw handles, planing knives, curriers' knifa blades and slickers, reaping and mowing machine sections, plastarers' mitering rods, etc.

The first saws manufactured in this city from sheet steel, wera manufactured by them and exhibited at tha Mechanics' Instituta Fair held in this city in 1865. At that time all tha work was done by hand, even the polishing of a 12-foot muley saw, (the plata of which weighed, before cutting tha teeth, 140 pounds). At the closa of the Fair, this larga saw was taken to the mill of Messrs. Macpherson & Wetherhee, at tha Noyo river, and, after a fair trial, pronounced by tham better than any imported saw thay had ever used. Since than, they, as well as nearly all tha other mill owners of this coast, hava continued to use tha saws manufactured by this company.

In 1866 this firm commenced operations on Pine street with one saw maker and one saw grinder besides thamselves. Their business increased steadily until their factory became too small for the extra amount of business done, when they were compelled to erect the building which they occupy, at 17 and 19 Fremont street, where they now employ an average of 35 hands, and have fitted up their workshops with the newest and most improved machinery, for the manufacture of the various kinds of saws made by them.

Judges allow that the exhibition by this firm surpasses anything of the kind they have ever seen in any other city, in the East or Europe. They claim to be able to compete with any manufactory in the world on *first quality work*, as they make this their specialty. In fact they have literally curtailed the importation of first class circular, muley, mill, cross cut and other saws, to the estimated extent of some sixty thousand dollars a year.

We have been somewhat particular in mentioning the above exhibition, for the reason that it gives us pleasure to encourage every enterprise that adds to the building up of manufactories on this coast. We have homes for thousands of impoverished yet skillful mechanics and artisans, not only from Europe, but also from our large and over-crowded cities East. We want work for our unemployed, and every factory that furnishes a chance for the youth to learn a trade is a benefit to this State.

Let our citizens encourage home industry, and if prosperity attend the enterprise, capital from abroad will invest among us and a new impulse will be given, and fresh vigor will infuse itself into our already growing and flourishing city.

A Really Valuable Invention.—Johnson's equalizing steam heater is one of the most useful and economical devices for heating and ventilating buildings that has ever come under our notice. By the application of a jet of gas, or a kerosene flame to a very small quantity of water, the whole of a large room is kept at an equable temperature for any length of time. We call the attention of visitors to the Fair to this apparatus on exhibition, or they can see it in operation at Fuller's, 149 Montgomery street. It is the cheapest, cleanest, and healthiest heater known.

More Eastern Fairs.—Faneuil Hall and Quincy Hall, Boston, have been rejoicing in the splendor of a Mechanics' Fair, which, according to the enthusiastic reporter of the Boston *Journal*, was to be, "in many respects," the finest exhibition, etc. The Vermont State Fair at Burlington,—of an agricultural cast,—drew forth half of the brown and rusty people from tha slopes of the Green Mountains, and some from Canada. "Mr. T. W. Park, of Bennington," says the reporter, "has on exhibition some excellent Durham stock, including two very fine cows."

[From the Mechanic' Fair Daily Press, Oct. 9.]

Elegant Furniture.

Visitors at the Pavilion are unanimous in their expressions of admiration at tha exhibition of furniture thera made; nothing equal to it has ever hefora been seen on this coast. This display forms one of tha chief attractions at the Fair, and tha extensiva warahousa of N. P. Cole & Co., of this city, makes a most notable exhibit. All that can ha effected by a combination, of art, tasta and variety, within tha limited apace allowed, is thera brought to bear. Whether we regard tha matchless beauty of the woods employed, the exquisita tasta of the upholstry, or the judgmant exercised in the designs and finish, equal credit must be accorded, and the scrutinizing eya fully appreciates the pleasing forms and elegant designs developed by patiant and positively skilled labor.

Most of our readers have doubtless seen this exhibit; but if they will take this paper in hand and come with us to tha furniture department of tha Fair, perhaps we can impart soma new ideas and give them a more full application of this really elegant display.

Standing by the upper or west end, we have first a mottled walnut bed-room set, comprising burean, bedstead, washstand, and somno, in beeswax and oil, well and and substantially finished. Next to that is a library set, in Russian leather, in the style of Alexander IV, finished with raisad panels, highly polished and trimmed with porcelain and silver nails, which afford a pleasant relief to tha somhre shade of tha ganeral finish. Each of these sets exhibit in their substantial workmanship a most pleasing contrast with the ordinary fabrications of such furniture as is generally palmed off in this age of shams.

We now come to a superb marquetry cabinet, with center-table to match, exquisitely inlaid with some forty rare woods, and emblazoned with porcelain medalions—that upon the cabinet heing an elegant *vignette* of Christopher Columbns. Next and near the center of the exhibit is seen the "Grand Sultana," upholstered with tricolored silk, and forming a chair fit for an empress, and one to which no description can do full justice. It is, as its name implies, after the Turkish pattern, except in the construction of its frame, which is of steel, and supported entirely hy the arms. By this arrangement the least possible pressure causes the chair to conform readily to the position of the occupant, while the open form aronnd the seat, covered merely by a loose and elegant fringe, allows a free circulation of air ahout the person of the occupant, and prevents the unpleasant and unhealthy warmth insepara-hle from the use of ordinary Turkish chairs.

In the rear of this is shown the much-talked-of President's chair, California's elegant gift to the White House at Washington, the design and execution of which was entrusted to the house of N. P. Cole & Co. This chair has already heen fully described and illustrated in our columns.

By the side of this we have another rich exhibition of California taste and workmanship, in the shape of a mosaic cahinet, which, also, to be appreciated, must he seen. Messrs. Cole & Co. have also two tables on exhibition, of tha same style of work and executed hy the same artists. Wa come now to a princely parlor set, in gilt and enamel, of the "Empress Josephine" pattern, upholstered in green and gold, and embracing seven pieces. By the side of this parlor furniture is a laurel bedroom set, which is a marvel of taste, heauty and finish. A set of the same pattern, but of less elaborate finish, was exhibited by this house last year, which brought them several orders, all of which have been filled. The set now on exhibition is made of selected lanrel, interwrought with plain walnut, and all superhly finished.

The furniture above described would grace even the peerless galleries of European noblemen, and suffer nothing when compared with the most elaborate work of French or English shops. No wood in the world can excal in finish or beanty the native laurel of California; and no European work, whether chaste or florid, can surpass that here shown from the shops of San Francisco.

Machinery Invades the Orient.—In the district of Cachar, Northern India, machinery has baen introduced for rolling the leaves, and a new process has been adopted for withering them.

A New Mining Pan.

Mr. Albert Moore, of San Rafael, a well known pioneer quartz miner of Amador County, is now constructing at tha Golden State foundry, in this city, a mining pan, on principles somewhat novel, and quita unlike auything now in usa. This pan is a grinder, a pulverizer, and a settler, combined. It can he made and sold for $1,000; weighs less than any other pan of equal capacity—ahont 6,400 pounds—and will answer every purpose of a completa prospacting mill. Cuhes of rock of the siza of ona or one and a half inchas, fed into a hopper which surmounts the central portions of the pan, are readily reduced to a degree of fineness auitable for ordinary pan work. The discharge of this grinder or crusher is so mada that tha sand will pass directly beneath tha mullers as in ordinary pans, where it is subjected to the usual amount of trituration, and thoroughly amalgamated. When this process is completed, the pan may be charged with a suitahle quantity of water to act as a settler; and when ready for the "clean up," the mullers ara readily run up by a screw ent upon the central shaft, so as to ba entirely out of the way of the charge and the operator. By opening plngs in the usual way, the water, aftar being settled, is drawn off, and the sediment and amalgam removed as from ordinary settlers.

Tha dies and mullers ara of peculiar construction, so as to secnre a full and effective trituration and circulation of the pnlp. In addition to the mullers, and immediataly over tha periphery, thera is a circular groove in which is placed a series of halls of ahont thirty pounds weight, and extending entirely around the circumfereuce of the pan. By the action of the pan these halls are so set in motion, and, it is claimed, add greatly to the triturating powers of the pan. It is designed to operate the pan upon a framework of wood, which it is claimed is so secured and braced as to make it full as strong and as littla liable to get out of order as though it were constructed of iron; while it can he built at much less cost, and more cheaply transported. In a timber country the frame can be got out and put together upon the ground, thereby sacuring an important saving in both cost and transportation. This pan is the rcsult of much exparience and experiment in the separata use of the grinder and the pan; and the inventor, who is a thoroughly practical man, is quita sure that he has produced a combination of the two, with a settier, which will greatly reduca the cost of machinery in a quartz mill; and at the same time provide the prospector with a cheap and effective mill which he can readily move from point to point, as he may desire, for giving thoroughly practical tests to veins without the great expense usually attendant upon the erection of expensive experimental mills. This is the first and only one huilt by the inventor, who desires hereby call to it the attention of practical quartz men and miners. It may be seen and examined at the Golden State Foundry, on First street.

Congressional Visitors.—A Congressional party, consisting of the following persons, arrived in this city yesterday morning overland: Hon. Marcus L. Ward, Hon. John Hill and wife, Hon. Geo. A. Halsey, John Y. Foster, S. R. P. Heath, A. G. P. Segur, and Dr. C. Beach, all from New Jersey; Hon. N. G. Ordway, wife and two daughters, of Washington; Hon. A. F. Stevens and wife, Dr. B. F. Ayer and wife, and Frank Ayer, of New Hampshire; Hon. Chas. Knapp, H. W. Knapp and Miss Knapp, and Mrs. A. J. Wheeler, of New York; Hon. J. W. Ferry and Miss Ferry, of Michigan; W. H. Ferry and Miss Ferry, Max. Hjortsberg and wife, of Illinois, and Hon. J. W. Asper and wife, of Missouri. The entire party visited the Mechanics' Pavilion yesterday.

Culinary Vessel.—William Jones, of Clipper Mills, Butte County, exhibits upon Dewey & Co's counter a culinary vessel for cooking fruit or preserves. It consists of an outer and inner vessel secured together so as to leave a water and steam space between them. A weighted valve is placed over a hole which communicates with the water and steam space, by means of which a pressure of steam equal to the weight of the valve can be obtained inside the space and around the fruit, when the water is converted into steam, which greatly assists in cooking the fruit, and avoids the danger of being hurned.

Monster Blasts and Hydraulic Pressure Sluicing. How the Mountains are Giving Way.

From a correspondeut who has been visiting tha renowned ancient river gravel mines on tha Timhnctoo and Smartsvilla channel—tha richest in continuance, and the most extensive mines of the kind in tha State—and who was fortunate enongh to witness the great blast of last week briefly referred to in thesa colnmns, wa obtain the following intercsting particulars. He writes:

The Smartsville Company, a few days since, exploded in their mine 1,500 kegs of powder in one blast, with perfect snccess. Four main drifts were run into the hill, from which side and cross drifts wera run to tha extent of 1800 feet of drifting, under a bank ranging from 35 to 110 feet in height; tha cross drifts being so arranged as to bring the greatest force of the powder nnder tha highest part of the hill. Wires with electrical cartridge attached were placed through the drifts, so as to ignite the powder at thirty different points at the same instant, the powder being placed in the drifts by simply taking out the heads of the kegs and dropping the cartrage into the kag; then twenty feet of the month of each main drift was tamped, tha wire from each drift connected with a main wire leading to tha battery, distance 200 feet from drift. All heing made ready, Mr. S. D. Field, under whose supervision the whola has been arranged, applied the battery. A dull, rumhling sound is heard with a trembling of the earth, the mountain rises as much as fifteen feet, then falls, a pulverized mass of cement and gravel. A hank or hill 35 to 110 feet in height, 600 feet front by 350 back, is ready for washing.

This company have two flnmes three feet wide, half a mile each in length, which then empties into a fonr-foot flume of moro than a mile in length, all lined with rock. They use 6,500 ponnds of quick silver. Over $40,000 have heen expended in opening and placing first class improvements on the mine, a very large portion of which was taken out the first or partially opening clean-up. There are several very important mining improvements being prosecuted at and near Smartsvilla, the particulars of which I reserve for a future communication.

Smartsville is one of the most flourishing mining towns of the State. It is situated eighteen miles east from Marysville, the Nevada and San Juan stages passing through it daily. Tha main street, for near a mile, is built up with neat family cottages, each with a neat yard, which is beantified with rare plants and select fruits. The housea are uniform, and neatly painted, which gives everything acheerful and prosperons appearance, such as is seldom met with in the mining towns of California. The town contains two chnrches, two achool houses with one hundred and thirty scholars; Masonic and Temperance hall, two expresa offices; tha offices and principal places of business of several prosperous mining companies, viz: The Excelsior Canal Co., the Nevada Reservoir Ditch Co., the Blue Point Gravel Mining Co., the Smartsville Hydraulic Mining Co., the Pactolas Gold Mining and Water Co., and the Mooney Flat Gravel Mining Co.

The mines are sitnated a short distance from the town, extending nearly two miles in length, following an old river channel, which in many places is covered with a mountain of gravel and cement to the depth of from 40 to 500 feet hafore reaching the gravel of the old river, which is from 90 to 100 feet in depth. The working of this upper stratum is the principal work of the present; and to work it with profit, powder and water, with large and long flumes, are made to take the place of manual labor.

Average Human Weight.—The average weight of several thousand persons who hava been weighed on the Howe scalcs at the Pavilion during the present Fair, as per record kept, is 120 pounds. This is a low average, and is made to appear, no doubt, from the fact that a large portion of them weighed were females, and probably some who were not adults. Quetelet, who devoted much attention to this subjact, says that the average weight of adult males is 136.9-10 pounds, and the averaga height 5.6 feet.

"What did the Israelites do after they crossed the Red Sea?" askcd a superintendent of a Sunday school. "They dried themselves!" said a shrill-voiced little girl.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

To Quartz Mining Companies.
To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—
One Steam Engine, 60 horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5 inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.
The Company having ceased operations intend selling off their effects as speedily as possible.
For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE R. HORNISH, Marysville; or R. W. HASKELL, Pacific Fruit Market, San Francisco 24v18-1m

Office of California Powder Works,

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

Milling and Metallurgy at White Pine.

The following items of information abont the mills and metallurgical works at White Pine, are from "G. B. E." whose communication has been somewhat delayed:

Several of the mills now in operation are about doubling their capacity, and changing from dry to wet crushing, as it is fairly proven that the ores of this district do not require anything more. The smelting furnaces are in full blast, as the shipment of lead to yonr city shows.

The water works are beginning to make an impression on the milling community. The water now flows into Hamilton, and nearly to the top of Treasure Hill. They offer to supply the nearest mill to the pipes at $1 per day per stamp, and have made an offer to the White Pine mill, in the center of Hamilton, at $1.50 per day per stamp. This is very reasonable.

Hon. Stephen Miller, of Philadelphia, has lately arrived here, and taken charge of the property of the White Pine M. & M. Co. The mill is well supplied with ore from the Charter Oak and Glazier mines of the company, and custom business. It is manipulated by Billy Wakefield, one of the pioneer millmen of Austin's palmy days, who gives general satisfaction to all with whom he comes in contact.

It is a hard job just now to get tests by mill process, of ore, as all the mills in the district are crowded with work; the Virginia mino being forced to haul their ore to the Centenary mill at Newark, a distance of twenty-five miles. This mine is now turning out a large quantity of fine ore. Pink District and the west side of the White Pine mountain, also avail themselves of the Centenary as they catch an opportunity. The Monte Christo mill is the only one idle in the district, and this should not be so, for they not only have quite a number of mines of their own, which furnish pay ore. but there is thousands of tons in their vicinity, desirous of milling facilities.

Condensed Steam Piston Packing.

This admirably simple and, as we are informed, effective invention,—exhibited at the Fair by the Chief Engineer, Mr. J. L. Constable,—was invented by Wm. Sullivan Gale, the assignor of Mr. Poillon, and consists in the simple discovery that if one of two moving surfaces in steam machinery, such as the face of the piston and the surface of the enclosing cylinder, be cut with a series of fine grooves, vertical or oblique to the direction of motion, and placed in close proximity—though not in actual contact to the other surface—that the steam insinuating itself between the opposing surfaces and into the grooves will, of itself, form such an obstruction to its further flow from either end of the cylinder as to make the piston practically steam-tight. The manifold advantages in cheapness of construction, non-liability to wear, and lack of friction, bid fair to revolutionize the art of piston packing, especially in pistons of comparatively small diameter and short stroke. The principle is equally applicable to packing for valve rod packing and the like.

NEW METHOD OF HANGING SASH WEIGHTS. Ezra Coleman exhibits, near the entrance to the Art Gallery, a new mode of hanging sash weights for windows, by which the cord and pulleys are concealed from sight. By the use of this device, the sash, upper or lower, may be made to rest at any desired point, the same as when hung in the ordinary way. The advantages of this device will be apparent to any one who may examine it. Patent applied for through the M. & S. PRESS AGENCY.

SAPIENT.—The *Scientific American* proposes to do away with laths, plastering, shingles, weather boards, cornices, panel doors, plank flooring, and to have cooking done by machinery. Inventive genius is to supply the substitutes.

34	800	Mrs. Robert Taylor, frame of California dried flowers.
36	803	Mrs. John J. Daggett, 4 sbell frames.
38	804	Miss N. Reynolds, frame of wax flowers.
42	807	Mrs. Bcnj. Haynes, 3 frames of wax flowers.
42	808	Mrs. Benj. Haynes, framc of moss work.
63	809	Mrs. E. Tracy, 2 frames of bead-work.
64	810	Miss N Reynolds, hair wreath in framo.
60	813	Mrs. E. Tracy. 2 bead embroidered pictures in blue and gold—No. 813 (Night) and No. 814 (Morning).
660	833	Miss Florence Rumsey, shell and moss wreath in frame.
672	845	Mrs. W. J. Davis, moss wreath and shell cross in frame.
236	265	Mrs. C. Cook, 5 frames of hair device work.

NOTE.—Any error or omissiou occurring in this list will be remedied on application to the Entry Clerk in the Pavilion.

INTERESTING TRIALS!

SHOWING THE

Relative Strength of Giant Powder, Gun Cotton and Black Powder.

The most interesting, and especially important trials for the Military Engineer with Giant Powder, against wooden objects, are those conducted by the Military Engineer Corps of the Royal Prussian Garde Pioneer Battalion against palisades. The results of these trials are taken from a certified copy of the official protocol and comparisons of the effect of Gun Cotton in blasting, having taken place in Vienna, conducted by the Military Corps of Engineers returned from Schleswig-Holstein:

A.—Blasting of obstruction; palisades being twelve inches diameter; round posts, eleven feet long, three feet in the ground and three inches apart.

1.—GIANT POWDER.—FIVE pounds placed in a single bag, hung two inches above the ground.

RESULT.—Three palisades broken off close over the ground, and an opening produced of three feet eleven inches in width.

2.—BLACK POWDER.—FIFTY pounds in a box placed at the foot of the palisades.

RESULT.—Two palisades broken, one close to the ground, and the other one and one-half feet above the ground, and two palisades pushed somewhat to the side; width of opening produced, three feet two inches.

3.—GUN COTTON.—A barrel with TWENTY-FIVE pounds placed against the palisades; firing by electricity.

RESULT.—Four palisades broken close to the ground; of the next two some splinters broken off; opening produced, three feet and seven inches. Hereby must be remarked that these last palisades were placed close together, with an earth-bank thrown up against the same on the other side, a circumstance favorable to the result.

B.—Blasting of a double row of palisades close together with an earth-wall thrown up against the same. Palisades pointed, twelve inches in diameter, eleven feet long, three feet in the ground; second row, or breast palisades, from six to eight inches thick.

1.—GIANT POWDER.—SEVEN pounds, packed as before, simply in a bag.

RESULT.—One breast palisade broken off three and a half feet above the ground, two pointed palisades broken off two feet above the ground; of a third pointed palisade there remained but a small piece standing; opening produced, three feet.

2.—BLACK POWDER.—SEVENTY pounds in a strong box placed against the palisades on the ground.

RESULT.—One pointed palisade broken off two feet, and one breast palisade two and one-half feet above the ground, two palisades pushed to the side. The opening made was not passable, the palisade burning faintly.

3.—GUN COTTON.—Pointed palisades; twelve inches diameter; twelve feet long and three feet in the ground; breast palisades from five to six inches diameter. For blasting were taken two barrels, each containing TWENTY-FIVE pounds GUN COTTON, placed fifteen feet distance from each other, and separated by a two-feet bigh earth-wall; simultaneous ignition by electricity.

RESULT.—Each barrel tore away three pointed palisades, with the breast palisades behind them, which produced one opening of four feet, and one of four feet six inches.

The result of these six trials is:

First—The effect of FIVE pounds Giant Powder, by single obstruction palisades, placed loose in a single bag, is equivalent to FIVE TIMES the weight of gun cottou, and TEN TIMES the weight of black powder, provided the two latter materials are put in bases with a strong resistanee.

Second—Against defective palisade works, SEVEN POUNDS of Giant Powder, in a loose enclosure (a bag) have a much stronger effect than TEN TIMES the quantity of black powder in weight inclosed in strong boxes, but a little less effect than TWENTY-FIVE POUNDS gun cotton in a package with strong resisting powers.

C.—A changed trial of the before described Prussian defensive palisade works.

The enormous but comparatively local effect of the GIANT POWDER proved in the former trials that a much more favorable result would be obtained by a more proper distribution of the GIANT POWDER to the nature of the object to be operated upon. For this reason the following trial was made:

A common gas pipe, 12 feet in length and 1½ inches in diameter, was filled with EIGHT AND A HALF POUNDS OF GIANT POWDER, soldered at one end and closed with a common cork at the other. This gas pipe was hung against the palisades horizontally, 2½ feet above the ground.

The GIANT POWDER was exploded by a cap and fuse. The explosion was an instantaneous one, notwithstanding the considerable length it was distributed, and fired only at one end.

RESULT.—Three palisades, with the breast palisades behind them, broken off at one and a half feet above the ground; of a fourth, only a small part remained standing; three others fell over as soon as touched, and two more broke off and fell to the ground on being pushed. One breast palisado broke off one and a half feet above the ground. There remained standing in the length of 12 feet only three palisades and three breast palisades.

This trial is very convincing proof what enormous results can be arrived at when the GIANT POWDER is properly applied. If TEN POUNDS had been used, very likely the whole length of 12 feet palisades would have been knocked down.

Very characteristic of the fearful effect of the GIANT POWDER was the circumstance that the gas pipe was broken into numerous very small pieces, and which had such enormous velocity that they penetrated the palisades like shot.

In regard to the former trials and those made afterwards, a strong inclosure, in which the GIANT POWDER was placed, was hardly necessary. The GIANT POWDER distributed in a canvas hose would have been sufficient.

The probability to do away with the necessity of confining the GIANT POWDER in strong vessels is of very great importance in using it for military purposes. In this way useless weight is not alone saved, but the danger avoided to the friendly troops being wounded by flying pieces.

This danger was especially a very great obstacle in the Austrian Army, from using the barrels made of Bessemer steel.

MOSHEIMER'S

Pioneer Mining School

— AND —

METALLURGIC WORKS.

ESTABLISHED.....1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to work any kind of ore, or mineral substances.

Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.

I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.

For terms, apply to JOS. MOSHEIMER,

Practical Chemist and Metallurgist.

Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

WALTHAM WATCHES.

Let every one who wants a Watch, read this carefully

Especially if in some remote out-of-the-way place.

Now that the railroad is open, we propose to give the residents of CALIFORNIA the opportunity of getting single genuine Waltham Watches at the

Lowest New York Wholesale Prices.

We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or

REFUND THE MONEY.

As an indication of the Prices, we will quote one Watch from our list. The P. S. BARTLETT, Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,

$28 in Greenbacks, or about $20 in Coin.

All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,

HOWARD & CO.,

Jewelers and Silversmiths, 619 Broadway, New York.

We refer, by permission, to

UNION IRON WORKS,

CORNER FIRST AND MISSION STREETS,

SAN FRANCISCO.

MANUFACTURE

ALL KINDS OF MACHINERY

MARINE, LOCOMOTIVE,

And Stationary Engines,

Booker Patent Locomotive Stack,

ARMSTRONG PATENT

Heater, Condenser and Filter, Combined.

BOILERS, HIGH AND LOW PRESSURE,

Pump, Pipe and Sheet Iron Work of all kinds; Quartz Crushing and Amalgamating Machinery, including High and Low Mortar for wet or dry crushing; Furnaces for roasting ores; Horn, Wheeler's, Patton's, and Belding's Amalgamating Pans and Settlers; Hendy's Concentrator; Hungerford's Concentrator; Hunt's Grinder; Blake's Crushers; Stamp Shoes and Dies of the best white iron; Russia Iron Screens, etc.; Flour Mill and Saw Mill Machinery in every variety; Hendy, Gang, Saw Mill, Pumping and Hoisting Machinery; Excelsior Force Pump, for domestic, ship and mining use—the simplest and best in use; Iron and Brass Castings of every description; Steamboat Repairs; Boiler Making executed with despatch. Steam Engines and Boilers constantly on hand and for sale.

We would call parilcular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built well proportioned, and evidently capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with wonderful uniformity under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.;

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

H. J. BOOTH & CO.

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive Contracts, and superintend the Erection of any Machinery that may be entrusted to their care

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. tv161

Spice from the Daily Fair Press.

When is iron the most ironical? When it's a railing.

A Colorado storekeeper solaces his customers with FyNe KUT 2 bak O.

"Spiritual Repose" is the Chicago name for dead drunk in the gutter.

A delicate parcel to be forwarded by rail—A young lady wrapped up in herself.

When a pretty girl falls in love with a lucky Irishman, her heart always goes pity Pat.

Why are kisses like the money taken at he door? Because they are the receipts of the fair.

Standing Upon Trifles.—Ladies wearing gaiter boots with two-bit pieces for heel taps.

Babies are the coupons attached to tbe bonds of matrimony. The interest is due at random.

Some politicians in San Francisco are like rivers—their moutbs are larger than tbeir beads.

Action should follow thougbt. No farmer can plow a field by turning it over in his mind.

Why can a bald-headed negro not join the colored Masons? Because he is blackbald all the time.

Ready to Fight or Pray—The Nortb German army has 159 chaplains—all high-pressure pulpit pounders.

A Cockney convert to Mormonism, who is disgusted with Brigham Young, says that poteutate is vive-wiferous.

What is the difference between General Grant and an old boot? One is sworu in and the other's worn out.

Utah has been shocked by an earthquake. The United States have been shocked by Utah for a long time.

The attempt to amalgamate Celestial China with Hibernian earthenware bas produced nothing but bad jars in this city.

Why are some of the pictures exbibited at the Fair like tbe prattle of innocent children? Because they are artless and witbout design.

Ike Partington's last trick was to throw his aunt's gaiter into a dirty alley and call the old lady down tbree fligbts of stairs to see an alley-gaiter.

"Mammy" said a precocious little boy, who, against his will, was made to rock the cradle of his baby brother; "if the Lord has any more babies to give away, don't you take 'em."

Jones says the ladies who come into bis store, examine his goods and leave without buying anythiug, are like a valuable class of surgical appliances; they are counter irritants.

A Base Use of Bullion.—A fashionable young lady was seen walking down Montgomery street yesterday with five-dollar gold pieces on the tips of the heels of her boots.

"How did you manage to get along in Paris without knowiug the French language?" inquired a gentleman of Mrs. Shoddy. "Oh, we had an *interrupter* with us," replied the old lady.

Jones says some of the pictures exhibited at the Fair aro well adapted for the decoration of anti-ritualistic churches, because they do not represent anything on the earth, in the heavens, or in the waters under the earth.

A Countryman walking along tbe streets of a town, found bis progress stopped by a close barricade of timber. "What is that for?" he inquired of a person in the street. "Oh, that's to stop the cholera." "Ah! I have often heard of the Board of Healtb, but I never saw it before."

A wealthy heiress of Madison Avenue, New York, has gone and married one of Bryaut's Minstrels, whereat all the *bon ton* of New York are iu a fever of excitement. Zounds! If San Francisco were to make a sensation over every young lady who makes a fool of herself in the matrimonial liue, even the *Alta* would not be able to print all the items.

A Powerful Medicine.—A curious doctor, who does not live very far from the corner of Post and Kearny streets, has compounded a most valuable medicine for ladies who prefer to wear the sable robes of widowhood, rather than go to grass. One of this class was recommending the compound to her dearly beloved hubby, and assured him that it was praised to the skies by the ladies. "Well, it may be," said he, "for many a poor devil it has sent to the skies to praise it."

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing: Furnace irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hanshrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v16tf

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.

O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrotula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the vellous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases wh re a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain remedies which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the physician only can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*; Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Co stant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in case a ot Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v13tf

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **289** Fremont street,

1v1 San Francisco.

The Most Important Invention of the Day.

HALL & LEE'S

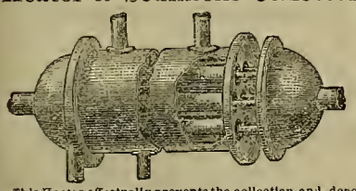
New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869 By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

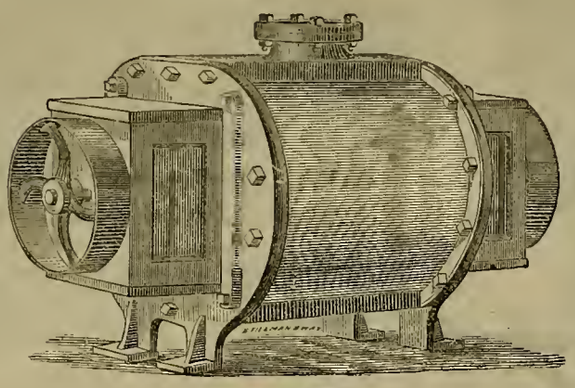
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

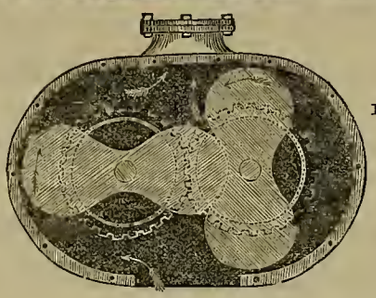
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harper's Weekly, and is the best printed and most valuable paper on the western half of the continent. All claims of patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveries throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

Important to Assayers.
Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:
United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.
Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.
Messrs A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Paunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
16v18-9p 519 Front street, San Francisco

To the miner, farmer and mechanic—the three great interests that form the base and ground-work of all our prosperity—this paper should be considered as almost indispensable. We wish the Press boundless success in the future.—*Placer Herald.*

Subscription, $5 Per Annum. Single Copies, 12½ 1-2 Cents.

A Journal of Useful Arts, Science, Mining, Farming, and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, OCTOBER 23, 1869. VOLUME XIX. Number 17.

APPARATUS FOR SEPARATING GOLD.—Daniel F. Hawkes, of Timbuctoo, Yuba County, has just received a patent through this office on an improved apparatus for separating gold from the sand and gravel, in the process of cleaning up flumes in hydraulic claims, tailings, etc., and which can be employed at any place where the pan is ordinarily used. It consists of a square box or tank, having a vertical sliding gate, which moves up and down across its center, dividing the tank, when down, into two sections. The tank is charged with quicksilver to a convenient depth, and the gate placed so that the lower edge penetrates below the quicksilver surface. The water and tailings or dirt to be washed are received into this tank on one side of the gate, and pass down under the gate through the body of quicksilver, being freed in its passage of all gold, amalgam and quicksilver, while the water, sand and gravel are discharged on the opposite side at a lower point than where it enters.

It is a well devised apparatus for saving both time and gold. Mr. Hawkes is a practical miner, and has made other improvements worthy the attention of miners, who can learn particulars of his invention by addressing him.

IMPROVED STEAM ENGINE.—W. H. T. Clark, San Francisco. This invention presents several novelties, one of which is the employment of an elongated cylinder for a piston, the packing rings being attached to the onter cylinder near the center, and stationary, while the piston moves through them, the arrangement being similar to that of a pump, for which letters patent have already been granted to the same inventor. The cylinder is made with double walls to save heat, and a space is left around the piston, between it and the inner wall, so that when the steam is admitted to the cylinder it fills all the space to the packing rings, and as the piston is thus all heated at first, there will be no new portions to uncover and thus diminish the expansive force of the steam after it begins to operate expansively. The valve is also formed with double walls, to prevent the exhaust steam from cooling the live steam as it escapes. Mr. Clark claims that a great saving will be effected by the use of his engine, and also that it will be less costly to construct, it not being necessary to bore out the cylinder.

NEW GOLD DISCOVERIES IN ALASKA.—The *Alaska Times*, published at Sitka, and several letter writers to the San Fraucisco journals, report rich discoveries in the Tarkou country, the southern part of the Territory of Alaska, near 54° 40′ N. L. The ground, located in the body of creeks, near salt water, is favorable for sluicing and yields five cents to the pan, according to statements of James Strickan and Fred. Douglas, the prospectors. They were directed to the spot by some Indians, and found the gold in scales, and in small lumps. The Kake Indians, who occupy the country, are hostile, and forbid the "Bostons" from "building houses there."

Baker & Hamilton's California Gem Seed Sower.

The machine herewith illustrated is built by the Sweepstake Plow Company, of San Leandro, (which company also manufacture the celebrated Sweepstake Gang Plow,) which, as may be seen from the engraving, can he readily bolted to the bed of any wheeled vehicle. The sower is set in the back part of the wagon with the sower part facing behind. The motion is obtained from the wheel of the wagon, and is communicated (by spur gearing on an endless chain) to a horizontal shaft, on the end of which is a bevel wheel which mashes into a bevel pinion on a perpendicular shaft, on the top of which is placed the ingenious device called a disk, which scatters the seeds. The disk is circular in form, and inclines downward in every direction from the center to the circumfereuce. It is provided, at suitable and regular intervals with flanges, which radiate (from a point forward of the center) in a direct liue beyond the circumference, and are curved and formed in such a manner, beyond the circumference, as to make a slight cup or pocket, which throw the seeds out like the hands. The disk is open on the two sides and in front, the back part bcing closed to prevent seed scattering in any place except in front. The seed reaches the disk through two feeding holes, mechanically arranged, so that when one is opened the seed is thrown to the right, and *vice versa*—both being open, the seed is thrown both right and left. The slides covering the holes are moved by two levers conveniently arranged for the operation. The sowers heretofore nsed in this State scatter the seed by centrifugal force in a perpendicular circle, thus covering the ground behind the propelling power twice, and also throw the seed so high that it is easily driven before the wind ont of its intended course, while the seed from this machine is thrown horizontally, and delivering at will in any direction. This is the invention of Mr. Floyd, of Illinois, and sold by Baker & Hamilton, who are sole agents for this coast. It may be seen in the agricultural department in the Pavilion.

This firm also exhibit Earle's Patent Steam Pump. This pnmp is made of different sizes—the one on exhibition being a No. 7, and capable of lifting 18,000 gallons of water per hour. The special advantages claimed for these pumps, are:

First.—It is composed of fewer pieces; every part is easy of access; all joints are "ground," and both pistons have "spring rings."

Second.—The steam valve is a single cylinder of cast iron, perfectly balanced, which in its motions is without comparative friction. It is operated by steam taken from the main cylinder, after it has completed its work and is ready to be exhausted, thus economizing steam to a great extent.

Third.—It is without "dead points," starting whenever steam is admitted to the cylinder, consequently dispensing with all starting levers, cranks, balance wheels, cams, springs, weights, gears, and other appliances ordnarily used.

Fourth.—The peculiar construction of the water cylinders render it easy to change the valves, thereby fitting them for either hot or cold, thick or thin liquids, oils and acids.

Fyfth.—It runs without noise or jar, and as the steam valve has only a horizontal motion, and being balanced, at a great speed also. It works as perfectly at one stroke per minute as at two hundred strokes.

Sixth.—Its price.

BAKER & HAMILTON'S CALIFORNIA GEM SEED SOWER.

Life-Boat Building on the Pacific Coast

Mr. L. H. Herrick's Metallic Life-Boat, in the southeast corner of the Pavilion, demands more favorrble consideration at our hands, and more space than we have given it, in view of the inaugnration of so important a specialty in construction, on this coast. Metallic life-boats do not cost much more than wooden ones, yet are twice or three times more durable. A common wooden boat of the same size as that in the Fair would cost $250; the latter costs bnt $300, and will last thirty years, if well painted. A metallic boat is, in fact, almost indestructable—the first iron vessels ever built being yet afloat. The importance o having more life-boats on the Pacific coast conld not be so eloqnently urged by anything we can say as by the fact that had the crew of the Harvest Queen, or other vessels lost during the year where not a soul has been heard from, been provided with one, they could have come ashore as certainly as if the journey had been on dry land. Every vessel should have one. Heretofore our Pacific-built ships have not been able to get them without paying too large freightage around Cape Horn. An ordinary wooden boat, it should be known, when once filled with water, can be sunk out of sight by one or two men, and will last but five or ten years. Mr. Herrick will make a specialty of building life boats. They are made of galvanized sheet iron, rivetted with tinned nails.

THE PACIFIC PIONEER PAPER COLLAR Co., have samples of their goods on exhibition which compare well with similar articles imported from abroard. The manufactory is at 769 Market street, between Third and Fourth. As it is the only establishment of the kind on the coast, and furnishes the trade with an article at least equal to the imported and on more reasonable terms, it certainly deserves patronage.

Mechanical Progress.

Machine Short-Hand.—It is said that a stenographic press has been invented in England by the nse of which the art of reporting *verbatim* can be acquired in mnch less time than by the old methods. The reporter aits at aomething like the keyboard of a pianoforte, and by applying his fingers to the keya, prints the words as they drop from the lips of the speaker, syllable by ayllable, on a strip of paper which rolls along underneath. This is done by means of vowel and oonsonant signs, which, like phonetic writing, may be "set np" in English by a compositor who understands them. The *Scientific American* says that a man in its employ got up something similar to this aome years ago.

The Kennedy Clock.—The electric clock shown at the late Industrial exhibition of the American Institute by the Kennedy Company, is thns described in the *Artisan*: "The cnrrents from a weak galvanic battery, transmitted through two coils of wire, act upon steel-bar msgnets set within the pendulnm ball. One of the wires is charged positively and the other negatively, and they are placed near the bottom of the case, so thst the ball of the pendulum awings in an open space in the center of either coil; when the pendulum ball reaches the positive coil, it becomes positively charged; it is repelled; and, swinging over to the negative coil, becomes negatively charged, and is again repelled. It is thus driven from side to side as long as the current of electricity is kept up by the battery. The alternate charges are made and broken by a simple slide-bar moved by a wire pin on the pendulum-rod. The only attention this clock requires is a spoonful of acid once in a few months. The mechanism that moves the hands consists simply of two cog-wheels and a ratchet-wheel."

Manufacture of Plated Spoons.—German silver (composed of nickel, copper and spelter) is rolled in strips and cut by machinery into blanka of the dimensions of a spoon or fork, which are rolled on graded rolls, which make one part of the apoon or fork thin and another thick. Next the blanks are dipped in acid and cleaned, when they are ready for plating. This latter operation is done by means of baths filled with liquid acid, in which plates of pure silver are auspended; the action of a battery prodnces a deposit of ailver on the blanks, which are hung in bunches in the baths. The process of deposition is gradual, and each bunch of blanks is frequently weighed to ascertain whether or not it has received the requisite amount of the precious metal. The time occnpied in single-plating tea-spoona is one hour and twenty minutea.

Scratch-brushing, bnrnishing, buffing, and washing complete the process.

A Peculiar Property of Mild Steel. At a late meeting of the Iron and Steel Inatitute in Middleborough (Eng.), a paper was read by a member of an iron-making firm, in which reference was made to a peculiar property of mild steel, obaerved in the course of late experiments upon the Siemens-Martin process. It was thus stated: "When ordinary steel was chilled in cold water at a red heat, it hardened more or less according to the percentage of carbon which it contained. When, however, the carbon was reduced below a certain amount, about 0.5 per cent.—it then obeyed the same law aa copper. The metal when chilled became aoft to the file, but at the aame time more compact, tougher and atronger."

Ramapo Car Wheels.—The Ramapo Wheel and Foundry Company in Rockland, N. Y., turns out 36,000 car wheels per annum. They use the iron from the hematite ores of Massachusetts and Connecticut, and the wheels stood the recent test of the 1200-pound drop beyond all others.

Machine Carpet-Sewing.—In some large New York carpet-sewing establishments, the operator now sits with hia machine on a car and travels aloug the aeam, sewing as he goes.

Safety Blasting Material—"Ammonia Powder."—A blasting material, which it is claimed will prove to be attended with less dsnger than gunpowder, gun-cotton, nitro-glycerine, or dynamite, has been mannfactured at the Nora-Gyttorp Powder Mills, in Sweden. It is the invention of Mr. Norrbin, and appears to differ from gun-cotton in having the cotton replaced by another material. Its explosive force is compared to that of nitro-glycerine. Blast-holes, loaded witn this powder, are exploded by means of a cartridge containing common powder. It does not require heating in cold weather. To test the safety of the new powder, experiments were made by fastening a lamp to a pendulum, which was caused to oscillate; gunpowder, gnn-cotton, nitro-glycerine, and dynamite, all took fire as the flame passed over them, bnt the ammonia powder did uot begin to burn till it had been touched hy the flame 20 times.—*London Mining Journal.*

Locomotive Light.—The *U. S. Railroad Register* thus describes a new light for use on rail cars or engines: "It is a sort of double water-cooler, with the gas-pipe issning from near the hottom. The top is arranged like a gasometer and rises and falls with the quantity of enclosed hydrogen. It is in fact exactly a "student's lamp" hydrogen gas generator, iron filings being used instead of zinc, and the hydrogen heing permitted to flow down to a lower chamber, packed with curled hsir, kept soaked with coal oil, which it takes np and incorporates. and so issues as carburettcd-hydrogen or common gas. The apparatus is self-regulating, cannot explode; needs no winding np; and must be cheap. The flame is tenacious under draft. The petrolcum needs renewal every six months."

New Method of Fixing Mineral Teeth to the Plate.—Duchesne, of Paris, has invented this plan: "Eaoh tooth is furnished with a hollow of a size exceeding that of the orifice, by which orifice the rubber in its plsstio state enters into the tooth, assuming inside the internal configuration of ths cavity; the rubber being then vulcanized, the tooth becomes firmly attached to the plate or foundation. The cavity is made by placing a plug of wood of the desired shape in the mold, when the tooth is shaped; this plug is destroyed by the heat in the subsequent baking."

Steam Velocipede.—The *Altoona Tribune* describes a steam velocipede, the invention of T. W. Worsdell, Msster Mechanio in the Pennsylvania Railroad shops. It consists of a small npright hoiler, 2¾ feet in length and 10 or 12 inches in diameter, of the best steel, neatly jacketed with walnut and brass bands, and having a smoke stack 12 inches high. The running gears consist of two wheels in front, on the axle of which the boiler rests, and one wheel in the rear (on a movable pinion), which assists in bearing np the rider and also acts as a rudder.

Boiler Tubes Coated with Lead.—A recent English invention reported in the *Colliery Guardian*, consists in covering the exteriors of the tubes with lead, either in the state of sheet metal or by dipping them into lead in a molten state, for the purpose of preventing incrustation and corrosion. The tubes may be covered with the lead in the following manner: The tubes are first tinned in the ordinary way, after which they are placed in molds, and a coating of lead cast around them; they are then passed throuah dies or rolls to reduce the lead to the thickness required.

Petroleum for Currying.—The *Mechanics' Magazine* says Vanner & Prest, of London, have patented the use of the residuum oil obtained in distilling petroleum, in the dressing of leather. When the oil is of a apecific gravity of about .880, which is about that of the oil aa now usually manufactured, it is nsed with tallow in the proportion of 14 pounds of oil to 16 pounds of tallow.

Gas Pipes without Cement.—Cast iron tubes for water or gas are now made in England by turning off one end conically, and boring out the end of the tube to which it is to he fitted at the same angle, so that the end of one may he inserted into the other without the addition of the ordinary cement. The junction is effected very qnickly, and the joint is perfectly tight.

The Centrifugal Machine for Wine-making.—M. LeDuc has substituted the centrifugal used in sugar-making, for the grape-press in wine-making. Tho result ia said to be aatisfactory.

Scientific Progress.

Dr. Van der Weyde's Reply—Force Not Independent.

We gave last week an abstract of an abstrsct of Prof. Walling's paper on the "Independent Existence of Force" from the *Gas Light Journal*. In the aame journal, Dr. Van der Weyde this week replies to the viewa therein expressed. We quote briefly:

"In regard to the assertion that force has disappeared in the pendulum when at its highest point, I answer that in the pendulum, just as in the lifting of a weight, work has been done, and that the force apparently consumed is ouly stored up, as heat is stored up in the process of separatiug the carbon from carbonio acid, by the power of the sunheam on vegetation, or ss we may atore up heat at any time as latent heat in steam. * * I maintain that there is no necessity for accepting the independent existence of force; the theory that all force is nothing hut matter in motion, offers a sufficient foundation for a sound philosophical explanation of most phenomena. As heat is only a mode of motion of matter, and as heat is convertible into force, force is another mode of motion of matter. I protest against the metaphysical sense given by Professor Walling to the expression "potential energy," and msintain that its rational mesning is simply the stored np, or latent motion of matter, either molecular or as a mass. I maintain that the primary cause of all force or motion of matter is gravitation, which once caused nebular matter to coalesce in diverse centers of gravity, and so originated planetary systems, the enormous motion of great masses of matter being changed at the center of attraction (the sun) into molecular motion (caloric). This molecular motion is now radiating hack into space, by means of vihrations of enormous velocities (light and heat); and on the surface of our planet, we may easily trace all motion back to the power of this (as it were) reflected gravitation (the sunheam). Surely without this agency there would exist on our earth no motion nor life, which latter is nothing hut motion derived from very complex chemical and thermic energies.

We are thus driven to the conclusion that all the diverse forces which surround us, and to which we owe our existence, are nothing but gravitation in disguise. And as in gravitation we find the origin of all force, and gravitation without matter is inconceivable, so force without matter is inconceivable."

A friend at our elbow says: We partly agree with both of these gentlemen. Undoubtedly gravitation (or attraction, which is the same thing,) is the cause of all motion in matter; as Dr. V. has here neatly and comprehensively summarized. In other words, gravitation is the "potential energy" of the atoms of matter, which caused them in the first place to coalesce. But whence came this potential energy of the atoms? Is it a conclusive answer to this question, to say that such energy is an attribute of matter? Is it not rather, according to the analogy, something "stored up"? If so, it had a source. And that sonrce must have been an independent one. Force then may he said to have an existence independent of matter. Indeed, the very *existence* of material atoma is *perhaps* dependent on constant action at that independent source of energy, whatever and wherever that may be.

But we do not offer this as *science*. Only *demonstration* makes acience; and thia is, and we believe will remain, undemonstrable. The best then that we can do, perhaps, is, for purely *scientific* purposes, to consider force,—or potential energy, or gravitation, or attraction, or whatever it may be called,—an attribute of matter; simply because we cannot go beyond that without going outside of the domain of science. In fact, we may remark, that as soon as we attempt to go back of, say, the *nebular* condition of matter, the condition of the matter hecomes,—so to speak,—slightly *nebulous*.

Plasticity of Pebbles and Rocks.—Prof. W. P. Blake read a paper upon this subject before the American Association at Salem, and exhibited in illustration an Arizona conglomerate, consisting of a paste of micaceous schist, filled with pebbles, and elongated and compressed. Prof. Blake brought forward arguments iu support of the theory that deep seated rocks often become plastic. He considered that the molecular movement of the hard rocks, so largely found distorted in the Sierra Nevada, might have been produced by enormous and long-continued pressure, prohably at a moderately elevated temperature. M. Tresca has shown that nnder such pressure aolida can be made to flow in the same manner as liquids. By stndy of the phenomena, new views were opened of the strncture of great rock masses, and varions phenomena associated therewith.

Ericsson's Late Researches.

At the late annual meeting of the National Academy of Science in Northampton, two interesting papers by Capt. John Ericsson were read; one on the "Retardation of the Earth'a Rotation by Solar Influence," the other on "Solar Heat and the Temperature of the Surface of the Moon." In the course of some letters addressed to Prof. Henry, introducing these papers, Capt. E. states that he has fully demonstrated the practicability of his scheme for making solar heat available as a motor; some of hia solar engines having attained a very high rate of speed. He also says that in order to facilitate his investigations, he has constructed a solar calorimeter and solar thremometer, by means of which such precisiou has been attained, that tho temperature of the sun's rays and the dynamic energy of its radiant heat, as determined from time to time by those instruments, indicate with considerable accuracy, the eccentricity of the earth's orbit. The presence of vapor in the atmosphere is also, by means of tho calorimeter, ascertained with much exactness. The solar energy being proportionately reduced hy a greater or less amount of such vapor, a register of it is at the same time a correct register of the amount of vapor present, if a proper allowance be made for the difference of zenith distance. A variation of a one-hundredth part of such amount of aqueous particles present in the atmosphere is readily detected by this instrument.

In a postscript to one of his letters, Capt. Ericsson makes the following remarks in reference to the

Temperature of the Moon.

"My investigations by meaus of the solar calorimeter and solar thermometer, prove conclusively that the temperature of the moon's surface under the fnll effect of the vertical sun, owing to the absence of an atmosphere, is not sufficient to render mercury fluid—much less will snow melt under such a temperature.

The irresistible inference I draw from thia fact is, that our satellite, in place of being a "dried-up sun-scorched body," is covered with ice and snow, the peculiar reflection observed resulting from enormous masses of ice upheaved and broken, during the cooliug and consequent contraction of the body, while the peculiar formation of the general surface, the innumerable circular cavitiea so unlike anything which the internal heat of the earth has produced, is the resnlt of hot water forced ont by contraction, scoopiug out the ice, and forming those vast snrrounding banks of snow and congealed water which excite our wonder; ultimately, during the last effort of the internal heat, raising those conical projections of ice which, in so many cases, stand isolated in the middle of the flat bottoms, the frozen ocean and lakes."

The Rocky Mountain Trend.—Mr. W. H. Dall read a paper at Salem, on this subject. He stated that the Rocky Mountain Range, between latitudes 60° and 64°, bends trending with the Eastern coast, so that instead of there being, as represented on the old maps, a straight line of monntains up to the Arctic Sea, there is an elevated plateau, only broken occasionally by a few ranges of hills. This hend of the mountains prevented the characteristio birds of the west coast from coming north, while a few species of Eastern birds came clear to Behring's Sea, north of it, over the plateau. He also stated that the elevation of the bottom of Behring's Straits 180 feet would make dry land between Asia and America, but that a deep ocean valley extended southwest from Plover Bay, just west of the Straits, along the Kamtschatka coast.

REVIEW OF THE FAIR.

Classification of Articles.

CLASS IX.

GLASS, POTTERY AND EARTHENWARE.

Glass Blowino is a successful industry on this coast; aad, notwithstandiug the many hundred gross of articles that are turned out mouthly by the Pacific Glass Co'a works, at the Potrero, the field ia not half occupied, for bottles aad common kinds of glass ware aro imported in qnantities sufficient to keep husy two more factories like that at the Potrero; and, of course, no ordera aro filled under the circumstances, from China, which couatry is supplied from Englaad, where labor is uo cheaper than Chiaese labor here, though the hurthen of taxation is less.

The Raw Materials

Are not yet fouad near eaough home to suit. Sand is at present obtaiacd from the beach at Oakland, but not the best. That from Monterey is excellent qnartz sand, hut is moro costly, hy reason of higher traasportatiou than tho Morria river saad of New Jersey, shipped around Cape Horn. Soda ash is obtained cheaply as a chemical side product from the Eaglish chemical works. Graphite of the best quality is obtained from Mexico. Salt aad lime are native. The ordinary proportioas are 100 parts aand to 45 soda ash, 15 lime and 3 salt.

Black glass hottles, aad demijohns of one quart to five gallona capacity, are the articlea for which the exhibition for the Fair is apecially meritorious. In respect to the quality of theae, our glass works excel, and in price they compete auccessfully with, the same articlea imported. The green tinged glass, composing the hulk, is colored the natural color of potash, the darkly graphite dissolved in tho viscid mass —which is quartz in the main, made soft, or fluxed, by the alkilies added, resulting in a silicate of aoda, etc. It is by the same general principle of adding alkalies, according to certain eqnvialents of silicic acid, that we flnx onr ores in smelting; or, in the wet way, that we succeed, as nature herself does in her aubterranean chemistry, in dissolviag everthiag in water, for redisposition elsewhere.

Fire-clay to make the great crucihles (of which four or five dozen are used up in the Pacific Glass Works anually), has not been found on this coast of the proper infusihility aud tenacity, so that Stourbridge and German clays have to be imported at $60 per ton. Many clays have been sent to iadividuals and to various works in San Franciaco, from all parts of the country, but their composition and qualities for particular uses are seldom tested, aad are not brought into wide enough notice amongst persons who might be interested.

The Display

Of the Pacific Glass Works at the Fair, coasists of the useful kinda of hottlea, demijohna, carhoys for acida, glasa tubea aad a large number of fancy productiona hy akillful workmen. After lookiag at this, the atudent of our progressing industries should visit the works at the Potrero, where he will he politely met and much eatertained. The proprietor, Mr. Beanett, is in the East, having gone with the Pioneers.

Pottery.

Our capabilities in this hrauch of maaufacture are great, but scarcely represented ia the Exhibition. Everything that can he is imported from the East and from Europe, where there are large factories turning out marketable goods by wholesale, at prices with which operatora here do not seem able to compete. The Albion Pottery at Antioch, Wm. Ries, of Salt Lake, Utah, and Clark'a establishmeat at Sacramento, are the only ones represented; the latter hy a very iateresting display of the raw materials, with a good assortmont of the more useful products. Though porcelain clay exists, of varied quality, in every part of the State, it has not hitherto heen worked up into any of the finer qualities of tahle crockery. The first attempt of tho kind is Mr. Ries' contribution from Salt Lake. He exhibits several small piecea of very tolerable porcelain, glazed and unglazed, which are auggestive as to what we may look for in the future from that directioa. Antioch contributes the hest stoneware products, in a few large vases, pots and water vessels, of agreeable color.

Glass Cutting and Ornamentation.

John Mallon and Thomas O'Neil hoth make splendid exhibitions of the kind of work belonging to their trade—cut, grouad, paiated, aad bent glass ornamentation, a kind of work in which there seems to be a great deal to do. Beat glass, exhibited hy tho former, is curious. Signs, aud othor ornameated hacking, gilt, ailvered, or mirrored, appear popular. James Lick exhihits some finely ornameated frames of the latter description.

Miscellaneous, and Imported Ware.

Glass aeckties, etc., made in Veaice, are exhihited by J. F. Fugazzi, in his toilet case. There are looking-glasses framed in spnu glaas of the same descriptioa, exhibited in the art gallery, also of Venetian manufacture, by D. Ghirardelli, which look uucomfortably fragile, aad aro lahelled at prices eutirely ahove tho value of such tasteless articles.

The best thing in the Fair, if we were only ahle to take the credit for it to ourselves, is the porcelaia, glassware aud statuary exhibition of R. A. Swaia, coataiaing a varicty of Freach porcelaiu ware which is auperb in design aad manufacture. Some similar articlca are also shown iu the silver plate cahinct of Haynes & Lawton.

Hallidie's exhihitiou of Morgan plumhago crucibles comes under this class, aud is noteworthy for its completeness of assortment. The excellence of these crucihles is such, that notwithstaading the high import duties, they are used to do most of our amelting in the small way.

Mirrors.

Gump, Whittier & Fuller, Jones & Wooll, and others, have placed numerous, and very splendid, mirrors on the walls of the art gallery,—but people never see the mirrors, nor the frames. If they are in the house-furnishiag way, they may be induced to glaace at the latter—which are very different in style, those of Jones & Wool heiag gilt aad highly ornate; while Gump's are of plain rich woods, with little gilding, aud to our taste very beautiful.

CLASS X.

SECTION 1.—MINERALS AND GEOLOGICAL FORMATIONS.

For mineralogists there is a good deal of interest in the Fair. Of ores, the Biggs & Gardner cabinet of

White Pine Specimens

Is one of the most interesting exhibitions of the kind ever made on this coast, as illustrating the metallurgical conditions of aay one locality. The novel feature of White Pine and its ores, is the extraordinary mixture, often innate to appearance, of pulverulent chloride of silver with carbonate of lime, or limestoae rock. For distinction's sake, the miners term this pulverulent impure suhstance chloride, whilo the pure chloride, resembling horn, is called horn-silver. To a mineralogist the mixed chloride ores are at first an unsatisfactory study; the yellow powder, colored by oxides of iron and antimoay, and carbonate of lead, may be rich in chloride or may he harren and base, or of limestone chiefly. The ore sorter'a practical information leads us into an acquaintaace with the peculiar mixtures which are rich—the mineralogical ingredients of which are an index to the chemical geology of the remarkable limestone-chloride region of Eastern Nevada. As in most metalliferous regions there are probahly at bottom two or three sets of veins, which run parallel in as many differeat directions, furnishing different minerals as ores, and of differeut age, as evidenced by the veins of one course uniformly cuttiag those of another. Copper and iron in association with both the "ameltiag" and "milling" orea are plentiful, aa azurite and hematite, hut lead, both as carhonate and aulphuret, beloaga to a region distinct from that of tho chlorides. Solfataric action has had much to do with the metals in this region, siace we have here great hlocks of hematite which, from their ahape, are to be recognized as precipitations from circulatiag waters. But the intimate degree of the association of chloride of silver with limestoae peculiar to one geological formation, remains an interesting problem for further careful observation. Mesars. Biggs & Gardaer have had uausual facilities for the oollection of the best specimeas that havo heen hrought to light, from tho earliest openiug of the miaes to the present,

Miscellaneous Minerals,

Consisting chiefly of ores and rarities, many of which are valuahle mineralogically, are exhibited in large and splendid collections by George Pfeiffer, and George P. Rose in the music room. In one of these we observe crystallized nativo silver, which is a rarity. Minerals to he of any valuo, should be named mineralogically, and classified. Ore collections are of no interest or use whatever except as showiug the occurrences of the several metals according to particular localities; and beiag often of scarcely recognizable mixtarea, ore labels should always note the minerals, as well as the gaugue. An oro collection not so arraaged and labelled, is good for oaly one thiug: to be disposed of for a aoag to aome one who will kaow what to do with it, in order to make it of use to the observer aad atudent.

Special Occurrences of the Metals

Aro illustrated hy G. S. Brown's specimens of gold bcariag cemeut aad gravel from the Pleistocene river chaunel, at You Bet, Nevada Co., (a comparisou of which with somo Australian deep placer gravel would be most iaterestiug); a large specimen of refractory partzite, a new variety of fahl-ore or grey copper, from Blind Spriugs, Mono Co.; clusters of aplendid crystals of ruby silver (proustite, or arsenical ruby, as we judge by looking through the glass) unnsually large, from the Cordillera mine, Mexico; some specimens of oxide of mangaaese from the Tide Water Manganese mine near San José, bclongiag to the systems of manganese veins peculiar to the cretaceons formation of Central California.

Lava from Earth's Interior.

From Kilauea, the great crater of Hawaii, the largest active volcano in the world, is exhibited by C. J. Clark in a neat case contaiaing ahout three dozen varieties, and a hundred apecimeas. What we call lava on the eastern slope of the Sierra Nevada is usnally vesicular basaltic lava. That from Kilauea is basaltic, and dark colored, bnt not alwaya vesicular. The lava of the western alope of the Sierra is trachytic—i. e., coutaius more ailica, and is of lighter colors. A descent into the great crater of Kilanea ia like watching the phenomena of creation, studying geology in the earth's foundation fires. Mr. Clark shows everything that a Yankee could lay hands upon under the circumstances,—and more, for he displays triumphantly an impression of the almighty dollar in the molteu rocks.

The magnificent specimen of Partzite on the Fair Press oounter helongs to Prof. A. F. W. Partz, of Oakland.

Systematio Collections.

A systematic collection of Minerals, Ores, Conceatration aamplea, Metallurgical products, Rocks, Soila, Fosails, Speoial and local geology, and Raw Products, embracing ahout 2,000 specimens, collected with regard to apeciea, and for private reference and study only, may be aeen in the Mining and Soientifio Press apace, the property of Mr. Bowman. The minerals embrace all the common, and many rare species, arranged according to Dana; all the ores of silver, lead, copper and iron especially. Tho orea are arranged according to metals and localities. The concentration samples represent the methods pursued at Joachmisthal, Bohemia; Freiherg, Saxony; Clausthal, in the Harz Mountains; Redruth, Cornwall; and Nevada County, Californaia. The metallurgical products represent smelting of tin at Altenburg, Sax. and Redruth, Cornwall; of lead, copper, etc., at Freiherg, Mansfeld; Central City, Colorado; Stockton, Utah, etc.; and various amalgamation products. The lithological specimens consist of a complete suite of all the leading apecies mentioned in the booka on that aubject—about 100—arraaged according to Cotta. The fossils embrace the frequent specimens from each of the geological ages, collected chiefly in Russia and Germany. The special geological collection embraces auites of the Eastern Boundary Survey (from Oregon to White Mountaias, Mono County); of the Rocky Mountains via Bridger's Pass; of the Pleistocene rivers of California; of Mt. Diablo, Tamalpais, San Francisco peainsula, etc. The aoils aud raw products are Californian.

Dr. L. G. Yates, of Alameda, exhibits in the same compartment, a suite of the Silurian, Devonian and Carboniferous fosails of New York and Ponnsylvania,—a very good collection of 50 specimeas.

A small cahinet of minerals and curiosities from the M. & S. Press office is to be seen at the opposite coraer of Dewey & Co's space.

T. H. Selby exhibits a suite of lead ores under various stages of coneentration, and smeltiag products.

SECTION II.—CHEMICAL SUBSTANCES, DYEING, ETC.

Little dribblets from tho chemical works and drug store lahoratories of San Franoiseo, chiefly the latter, constitute all that there is in the Fair uader this section. The exhibition is still more unsatisfactory than that of last year. Scarcely aay other department of the resonrces of a new State could make so iateresting a showiag. There are Wakelee'a, Rogers', Judaon's, and Falkenau & Haaks' ohemical works, large establishments, quite narepresented. Crane & Brigham have a largo case of very pure crystals of aulphate of copper, which is maaufactured for seed curiag, and for pan amalgamation—the only chemical raw product exhibited. In aome of the natural products of Californaia, there are, nndouhtedly, the germs of future profitahle manufacturing, in virtue, chiefly, of conveuieace for economical prodnction; and many a good thiag ia therefore rather kept aecret hy those who know its value and the means of making it valuable. Our availahle deposita of aulphur, borax, carhonate of magaesia, sulphates, chlorides aad carbonates of soda and potash and lime, nitrates and what not, are to a great extent undeveloped, either because the market or tho maaufacturer is not ready. What *is* beiug done, is proclaimed oaly through the regular channels of business, to those who acek the supply, and none besides. Gradually Eastera importation is undermined hy chcaper native production, yet so quietly that the coasumer has scarcely become aware of the change. The acids, painta and wholesale commercial chemicals made at home, are not he fore ua for dissertation. We can ascertain who makes the chloride of lime that we huy, but not through the exhihitions at the Fair. Very oreditable progress has been made in the manufactare of acids aad all the finer chemicals for which there is a demand.

Pacific Oil and Lead Works.

One prosperous establishment that is fledged and developed long aince into a commercial institution of the city, is creditahly represented, yet only in part,—the Pacifio Oil and Lead Worka—projected and brought into succesaful operation hy Mr. Brunaer, the Superintendent. Here lead is oxidized and tranaformed into carhonate or white lead, to make paint. The intermediate product is not exhibited, but the oils required, aad the linseed aad castor bean from which they are manufactured, are displayed in various stages of purification; and an excellent article of metallio paiut for ahips, manufactured from these products, is exhibited in small cans.

Dyes.

Imported liquid laundry hlue and "Parepa Rosa's toilet compaaion," exhibited by S. Pillsbury; a case of aniline dyes, hy H. Manz; Fugazzi'a hair dyes; aad a California-manufactured composition for staining wire cloth and wood, hy Samuel Purdy; and also some patent stamping powder for embroidery, hlack aad white, by Mrs. R. L. Joaes, of Sacramento, constitute the budget of articlea under this mysterious head. Some of these dyes are of vegetable, and others of miaeral origin, the tests for which are very simple as given tahularly in Bolley'a Technical Analyais. To test a youag lady's lock of hair, hurn it on platiaum foil, then moisten with various solutions to detect any of the vegetahle or mineral dyes in the catalogue of commerce, from madder red to chrome green.

Curious Compounds

For nseful purposes, are Steele & Co's "Sun Pearl" for the complexion; Dr. Barker's chemical compound for strengthening cordage,—a white powder, composition not stated, which is dissolved ia water and supposed to he a better atimulant to lax fihre than brandy and water; Charles Zwick'a Caucasian fly glue, a suhstance operatiag on the mock-auction principle, of giving to the world that which is most wanted, but with a slight drawback.

Mineral Waters.

We are not able to keep the run of these, nor even to follow them up, hut certain it is that we are blessed with riches here. Napa, New Almaden aad the Summit Soda Springs, etc., are becoming widely knowu already for their extraordinary qualities, the chief of which is an exuherance of carhouic acid, heiag associated with various miaeral ingredients of stomachic and constitutional influcnce. Pacific, Congress and Seltzer water, exhibited by L. R. Mills, Napa soda, by Dr. J. H. Wood, and New Almaden Vichy Water, hy Pioche & Co., besides some aromatic waters, by Edward Louis, are what we have to taste and see in this specialty. These waters are bottled and delivered or shipped at moderate prices; a work amounting appareatly to a very considerable, and not unprofitable industry.

Oils and Soaps.

Amongst our new and flourishing industries the preparation of oils for various

purposes, and the manufacture of candles, soaps, lubricating compounds, etc., occupies an important place; though we are merely following in the trade and practices of similar establishments elsewhere.

Beginning with Madame Balcear's vegetable washing fluid, the principal ingredient of which is curiously derived from a plant growing plentifully on the hills in California. The list of soaps embraces Kane's condensed soaps and fluids, from the Parrish soap works; Chiloott soap, made "from an entirely new base," by James Scrimgeonr; samples of the Challenge Co's soap; J. H. Warwick's "sapolis;" Dr. Clapp's chemical soap; and last, but most satisfactory and interesting exhibition of all, the Standard Co's assorted soaps and samples of raw meterials, cocoanut oil, caustic soda, oleic acid end tallow—and incidental products—carbonate of soda, sulphete of soda, gypsum and residunm.

A business branching off in another direction, is the glue and neats foot oil establishmeut of Dana & Coddington, which is represented by a fine exhibition of glue of various kinds in herrels and sheets, aud some very snperior curled bair. There is much money in all these side products from the butcher shops, and they are in never ceasing demand.

Polish.

Spanish lustral for the hair, exhibited by Lempe; Lake'e blacking; Waite's California megic polish; Hatch's Spenisb dressing for leather, are varieties of oils and colored substances that make polish—oils that will dry with a emootb reflecting surface.

Lubrication.

Axle greese is preferred, from the manufecturers, in California. Hucks & Lambert have long been making a superior article, the head of the establishment, Mr. John J. Hucks, being one of the best authorities, practical as well es theoretical, on hydrocarbons, in the country. Great skill is requisite in the distillation of oils, in order to obtain the kinds best adapted to this purpose. Stringer and others also exhibit superior axle grease.

Hair Restoratives, and Miscellaneous.

Hair restoratives are represented in the Fair by M. Howard, the colored specialist, in person,—a very gentlemanly and enterprising man, who examines the decayed roots of fallen hair like a doctor, and in many ceses finds it possible to re-invigorate them end to stimulate growtb to sucb a degree as to meke the results eppear more astonisbing than they really are. Mr. Howard exbibits photogrephs of persone enccessfnlly operated upon. Boxes and bottles of California ink, by J. J. Knowlton; Russian inflammeble balls, by Michael Lebeterd; yeast powders, saleretne, etc., by Boyd & Co.; homeopatbic chemicals, by Sontag & Co.; oxygenated paints, by J. E. Colemen; cough drops, by M. H. Garland; and Buckeyo Selve, by Eakin, complete the miscellaneous cbepter. It may be remarked in conclusion that the pharmaceutists of San Francieco, regular and irregular, are as active as they are in the East in compounding peculiar mixtures for special ailments, or for general curing, of the stimulating clase.

CLASS XI.

Jewelry, Silver and Plated Ware.

The only jewelry on exhibition is a fine display of Hair Jewelry by Mrs. C. Cook, of 519 Montgomery street, wbo exhibits several cases of sucb work, together witb other bair work of verions styles and patterne. Aleo an apparatns for bair work in practical operation. Mrs. Cook has long held a prominent position in this specialty of fine manufactures. It is a branch of ornamental work worthy of encouragement when conducted with such becoming skill.

The Paoific Plate Works, Haynes & Lawton, make a fine exbibit of gold and silver electro-plated ware, comprising every variety of table furniture in that line, most of which cannot be distinguished from the solid article. The application of this process for covering copper, German silver, Brittania metal, etc., with eilver and gold, is now very extensive. Ae is well known, this method of plating is accomplisbed by depositing eilver or gold upon the article to be plated, from a solution of those metals, by the aid of galvanic action. The great art and secret of this process consists in the proper preparation of the plating solution. A very slight knowledge of chemistry will enable a persou to deposit a film of silver or gold upon a surface of copper, etc.; but much practice and skill is required to perform this work in a really rtistic manner. Various hindrances and impurities ere lieble to he found in the solution, which, if left there, would fell upon tbe snrface of the article, and render it rongh and unsigbtly, especislly to tbe practiced eye. None bnt a skillful workman csn meet ell these contingencies. Tbe exbibition of the Pacific and S. F. Plate Works afford complete evidence tbat both of these establishments fully understand their business.

The San Francisco Plate Works exhibit one cese of new plated work and another of old ware, replated. Tho difference between the two is quite apparent, and shows the impossibility of giving to old ware the sharpness of outline and finish thet is found in that wbich is new.

George M. Wood & Co. exhibit a large veriety of door plates, "fire plated." Mr. Wood also exhibits a fine assortment of stencils, seals, business stamps, etc.

Tbe process of "fire-plating" is quite a different thing from the electro plating, just described, and is done by rolling together tbe two sheets of metal under heavy pressure, the surfaces to be joined having first been wet with a solution of borax, and then subjected to a semi-welding beat. Tbe union between the surfaces so treated is much stronger than that effected by the first described process. This mode of plating wes first introduced in 1742 by Tbomes Bolsoner, of Sheffield, Eng., end soon became one of the etaple trades of tbat celebrated manufacturing town. The principle of electro-pleting, though known to scientists as early as 1801, was never brougbt into practical nse in tbe arts until 1837, wben Mr. Thomas Spencer, of Liverpool, mede his experiments aud communicated their reeults to the Polytecbnic Institution of that city. Of late years, tbis process has almost entirely superceded that of "fire-plating."

Geo. T. Cascbolt, two cases of elegant silver plated ware for coaches, lamps, etc.

John J. Joiner & Co., mannfactures of metallie eigns, make a fine exhibit of such signs and specimens of engraving on metal. Odermatt & Ettlin exhibit patent fountain pens and drawing instruments.

In dentistry, we have two exhibits of operative work—T. C. Jessup and Q. L. Adams, each of whom exhibit a case of samples of their work in that line. D. S. Hutchinson exbibits a case of specimens of mechenical dentistry, embracing among otber things his petent flexible plates.

G. W. Patch exhibits samplee of etencil work; and F. M. Truworthy exhibits stencil plates and impressions. Mr. Hilton, of Chicago, also sends eamples of work in this line—consisting of one large ornamental piece, also stampe, etc.

Two bare of silver, taken from 12 ponnds of rock from the Treesure Koy mine, of Wbite Pine, are exhibited by N. Basset, whicb, from tbe inscriptions npon them, are intended as keepsakes for his mother and sister.

CLASS XII.

The Art of Printing and Printing Presses, Lithography, Engraving, Book-binding, Paper, Type, etc.

The Art Preservative is represented chiefly at the Daily Fair Press stand of Dewey & Co., publishers of the Mining and Scientific Press, including emong other articles, the following:

A Railway cylinder press, of Englisb manufacture, (with a Yankee improvement by George T. Pracy) on wbicb the Daily Fair Press is printed; a Ruggles' Diamond card press, by Spaulding & Barto, end a small Wasbington hand pross, by E. F. Hartsborne, upon which a lad, dressed in continental costume, is engaged in working the old-fashioned inking balls and printing a fac-simile of Ben. Franklin's first paper, printed in Boston, Feb. 11, 1723.

Dewey & Co. also exhibit two frames of specimens of designing and engraving on wood, drawn and engraved by artists in the office of tbe M. & S. Press.

Two copies of antique newspapers—the *Herald of Freedom* and *Federal Advertiser*, printed in Boston, December 15th, 1788, and June 12th, 1789—the latter containing President George Washington's letter in response to a complimentary address from members of Congress, the property of Mrs. Hopkinson, of this city.

Bound copies of the first three volumes of the Daily Fair Press.

Each issue of the present volume of the Fair Press contains eight pages, forming a sheet of half the size of the N. Y. *Tribune*. It is printed daily on good quality of paper, and circulated free to all visitors. It is doubtless the largost daily newspaper ever printed and circulated gratuitously, and bas tbe widest circulation of any Fair paper ever publisbed.

As samples of newspeper printing, eleven bonnd volumes of the M. & S. Press, end copies of the Montbly and Quarterly Series of the M. & S. Press.

D. Byle exbibits the Novelty printing press, in rear of tbe Leed Works.

In the art gallery, Warren C. Butler exbibits choice specimens of wood engraving; G. W. Sbourds has also some fine wood cuts; and A. W. Stott a case of engraved cards. Cuhery & Co., and Taylor & Co. exhibit specimens of various styles of job printing; Brown & McDowell, of show card printing; and Taylor Bros., of copper plete engraving and printing.

Reilroad bulletin boerds are shown by P. G. Beem, J. G. Crocker, and W. B. Swan; also two large advertising frames by Gilmore & Van Norden. W. S. Jacobs exhibits a steamer sheet of the *Alta California* newspaper printed on silk.

The only map on exhibition is one of the farm of L. A. Gould, of Senta Clara, drawn witb a pen. Henry White, of San Mateo, exhibits a scrap-hook and journel of travels in Asia, Africa, end America; A. A. Rosenberg, specimens of California musical publicetions.

Burgess & Stratton exbibit in this department three patent music folios and four patent papsr file-holders, a Californie invention of much merit, which was illustrated and fully described in the Press of October 19th.

H. H. Bancroft & Co. exhibit a case of law books and miscellaneous publications, also diaries, blank books, writing paper, etc.

Geo. B. Hitchcock makes a very fine sbow of blank books, of bis own manufacture, all of whicb ere very creditable to his establisbment. He also exhibits letter presses, of superior manufacture, and stands for the seme.

Hicks & Co. exhibit elegant specimens of book-binding—stetely ledgers, with substantial binding, blank books of various kinds, and miscellaneous publicetions, elegently finisbed in gilt, etc.

Bartling & Kimball also exhibit specimens of book binding, executed in tbeir usually olegaut and substantial style.

Mr. Hourcade exhibits in this department a cene made of paper; Mrs. James Sullivan a box of stamps, and Mr. A. L. Stemson, one of Auer's patent cbeck cuttere.

The Paper Manufacturing Interest

Is represented by two companies—the Pioneer eetablishment of S. P. Taylor & Co., and the Saretoga Paper Mills. The former has been in operation eome twelve or fourteen years. The works are located at Taylorville, Marin County, and tbeir long and continued success have shown conclusively tbat California csn produce her owu paper, if cepitalists can only be found willing to invest the needful amonnt. The paper on exhibition, consists of Manilla and blue paper, and paper bags. Tbe texture and quality of the same is equal, if not snperior, to paper manufactured for eimilar purposes in any part of the Union; indeed, we are told tbat Taylor & Co'e wrapping paper is preferred in this market to thet of Eastern make.

The Saratoga Mills, Pfister & Co., also make a fine exhibit of etraw end Manilla papers. These mills are located a short distance southwest of Santa Clara, and have etarted, we believe, within the year just passed. There are large stocke on exbibition from both these mills. If we ere not mistaken, there are two otber paper mills in operation, or abont to go into operation, on this coast, one near Point Arenas, in Mendocino connty, and the other in Oregon. There ie room and business enougb for all. It is about time that the Pacific Coast was entirely independent of the Eastern States for both news end wrapping paper, and we trust tbat sueh euccess will attend these pioneer esteblisbments as will soon etop the outflow of money for tbese indispensable articles of merchandise.

CLASS XIII.

Vehicles for Land Conveyance.

The "Dandy Hobby-horse."

Had any one entered the Pavilion six months ago, and tben undertakeu to prophecy the character of the vebicnlar display at the approaching Fair, he would bave been very positive that both space and prestige would be monopolized by varieties of velocipedes, queer and otherwise—including of course the "coming velocipede." This, we rather regret to say, has not "come,"—to the Fair at least, for there is not a single velocipede on exhibition. One from Pickering & Davis', N. Y., is ou the records; but it has laid itself flat ageinst some friendly post wbere it is quite invisible; to see, perhaps, and not be seen,—to gaze upon tbe moving world, wbich is the unnatural mother tbat gave birtb and life to the hobby and then neglected and abandoned bim in this manner, to his own reflections npon the utility of "hobbies and tbings" being born at all.

Enougb has been demonstrated, however, to satisfy us that light vehicles of this character, perbaps witb rubber tirss, will yet answer a practical purpose, in special cases. Some of tbe three-wheeled machines may be made to do. The absence of all velocipedes in our midst, here, wbere so many ingenious ones were made, indicatss tbet the owners do not teke pride in tbsir aehievements in that direction. Perhaps somebody will try again.

Eastern Manufacturers in the Market.

It is euthentically reported tbat some of the Eastern carriage and wagon manufacturers have recently been shipping vebicles to Nevada and California by the Pacific Railroad, and delivering tbem at prices lower than tbe same could be manufactured in San Francisco or Sacramento. Kimball & Co., we learn, on the other hend, have been shipping some of their carriages to Chicego; and it is certain that our local shops can bold tbeir own, though for a time cbeap labor in the East may give the adventagee to others for wboleeale manufecturing. Except in the locel order shops carriage menufacturing, like everythiug clse, at present, is dull. The Kimball Company bave discharged the majority of their men. Casebolt & Kerr heve so large a local order department that locomotion itself would have to cease before their business would come to a etand still.

The Carriages and Their Merits.

Tbere is really a finely assorted, complete display in the vehicular line, at the Fair. We have little to say touching the superior merits of the fine carriages and buggies of the different firms, after looking at them; they are the genuine, first class American erticle, light, handy and durable, the best in tho world, excepting the English in point of durability. We hope tbat the reader has one—a Kimball four-horse—to ride in.

Casebolt & Kerr, Lerkins & Co., the Kimball Manufacturing Co., Burham, Black & Miller, and Willey are tbe exhibitors of these chariots of fortune, wbich aro either ligbt and fast, or colossal, covered and grandiose, or cosy and domestic, or antique and profoundly respectable—according to the tastes and characters of our lords and ladies. Quality and style are a matter of price. We find none of them to compare in haudiness, rcliability and cheapness to the human velocipede, the prettily chiselled two-legged vehicle, for whicb the manufacturer has never takeu out any patent.

A model brewery wagon, with platform eprings, for very heavy loeds, is shown by Paul Trievhofer, one of the fiuest wagons made for use. A milk wagon, by Lawton & Co., is well adapted.

Wood.

All the meterial is imported. If we have any wood that will do for carrieges or machines, onr mannfacturers are not aware of it, for tbey say it is all brittle and inferior. Even Oregon hard wood loses its toughness as soon as it becomes dry and seesoned. The Koa wood of the Sandwicb Islands is very herd and strong, and beeutifnl besides, but has not been tested for toughness by our manufacturers, eo fer as we are aware. If it be a fact that notbing grows here edapted to mechanicel uses, then it will be a profitable business to plant and reise certain kinds of hard wood trees—a matter alreedy begun upon in different localities in this State to tbe extent of a few acree.

Iron Wheels.

Some important inventions are brought for tbe perfection of vehicles. First is Mr. T. R. Smith's newly patented iron wheel, which bas merits tbat sufficently commend it to onr notice. There have been many futile attempts to construct irou wheels, which have bitherto generally failed because tbere were iron castings, which would break. Smith goes to work ignoring none of the laws of mecbanics. The principal object of an iron wbeel is to gain strengtb, durability, and above all to avoid contractiou hy heet—a defect of wooden wheels which a few years ago cost the U. S. Government the loss of a wbole train of wagous from falling to pieces while crossing an arid spot in Arizona. Smith's wheel is of iron tubing, etc., hub and all; contraction and expansion being fully provided for by

means of rubber packing. The two wheels and hind axle shown in the Fair have themselves undergone an extraordinary test. In connection with the two front wheels of another wagon, and under a heavy load, they were driven over the roughest places, railroad tracks and the like, to be found around this city for half a day, until the front wheels entirely gave out. Though these are heavy, the same principle will apply equally to light buggies which can be built, Mr. Smith thinks, of as light a weight, and of much more airy appearance, than the lightest now made of wood.

SPRING FACTORY.

A very worthy new industry is represented in the Fair by Beldnks & Sicotte, of the California Spring Works, located on Folsom street, near Fourth. A large furnace for heating a whole bar of steel at once, and steam machinery for drawing it out, are the leading new appliances. Heavy springs, and light as well, are the products, which are to be seen at the Fair in every variety. Another very fine exhibition of the same kind, together with a testing machine, made by Wm. B. Betts, whose works are in the rear of Casebolt & Kerr's carriage factory on Market street. Two different dump wagons, four-wheeled models, of excellent points, are shown by John Craig, a California inventiou, and by G. R. Cramer, an Eastern. The former turns up the bottom boards by means of very simple but powerful levers; the latter has the entire bed elide backwards, until it tips.

INVENTIONS.

Other meritorious inventions are Porter's improved rail for city streets; Pool & Carlton's double extension tire tightener; T. G. Walter's model for coupling vehicle shafts; B. Keiley's adjustable tongs and S. L. Pereiras' Belleville buffer and railroad spring, all of which should be looked up by those interested in such matters, as they are best understood by personal inspection.

CLASS XIV.

LEATHER AND ITS MANUFACTURES.

We claim that the Santa Cruz leather is the best of its kind, or kinds, in the world. Our manufacturers prefer it. The tanneries are located at Santa Cruz for no other reason than the superior quality of the tanbark of that region, obtained from the chestnut oak *(Quercus densiflora)* called sometimes, on account of the wet and spongy appearnnce of the wood when first cut, the water oak, which is plentiful on the seawnrd slopes, extending as far north as Mendocino, but always in or near the redwoods. There ie a fine tannery in operation at Bay View, on the San Bruno road—Manasse & Baker's,—which undertakee especially the manufacture of the finer qualities of leather; and from the specimens shown in the Fair this year, we have of the impression that an expert would pronounce the results, in part at least, successful, or equal to the best French leather imported. In softness and pliancy, the common as well as the patent leather exhibited could easily be mistaken for a French article. There is another large tannery in Napa Valley, which uses a different kind of bark, but with less favorable results. Malone & McMahon exhibit samples of excellent kip and calfskin; the raw article must be further studied in the saddlers' and shoemakers' exhibitions. One of the finest displays this year as last, is by Main & Winchester, whose productions for lavishing wealth are more tasteful than are imported. A beautiful set of harness for President Grant is in the lot.

INVENTIONS.

Not a few useful inventions might be mentioned in connection with Messrs. Main & Winchester's exhibition; an excellent double horn for ladies; a girth that is tightened by the stirrup; a wheel hub, invented by a lady, Mrs. Whiting, being merely a leather capping to place over the wheel for protection of ladies' dresses in getting in and out; a stirrup cap, which is a simple contrivance to prevent the foot from slipping through too far. The largest "bull-whacker" in the State hangs down from a lofty nail, like a serpent that it is. Other inventions to be noted are Hough-ton's Mason whip hanger; J. C. Gage's patent adjustable breast collar (worthy of examination) and Scrimgeour's patent shoe heels.

Stone & Hayden make a nearly equally splendid showing of everything in the saddlery line, especially saddle-trees. Geo. F. Thiel, of Marysville, Barr, of Sacramento, and Lawless Brothers exhibit saddles of California leather, highly ornamented.

MANUFACTURED ARTICLES,

Besides saddlery above mentioned, consist of sole leather products—trunks, belting and hose pipe of spleudid quality, exhibited by Behrendt & Co., Bakor & Hamilton, and French & Co.; and of fins leather, into shoss and boots, by L. Price, Scrimgeour, Broderick & Kast, etc.; with some fancy frames, mantol piecs and watch pockets, etc., by G. B. Falck; and leather frames, with worsted center, leather bracelots, otc., by Mrs. A. D. Baker.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for ovory issuo, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Locution; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, October 22, 1869.

Financial.

The condition of our local money market remains quite unsettled. Momentary case is experienced from time to time, but there appears to be no radical change. Business is conducted on a very economical scale, and, despite the long continued stringency, lasting now for four months, we learn of no serious calamities among business men. Some few failures have occurred, but not of a character to influence other parties. Their decadence was gradual, and the result of inconsiderate speculations, while their transactions were too limited to create more than passing remark. The rains have commenced in downright earnest. Within the last three or four days a large quantity of water has fallen, and it is possible that some damage has been done to the cords of wheat piled up in various unprotected localities.

An evening contemporary published a financial article, entitled, "What is the value of a hundred dollars?" which is well reasoned until the writer ventures upon a suggestion, when he involuntarily exposes a superficial view of the subject. He says: "The Government uses two kinds of currency—specie and paper. By positively refusing to receive the latter for customs, it lends its influence to depreciate the very money which it has created; that is, if a thing having no intrinsic value may be called money." There are two objections to the quoted sentence: the first is, Government has $1,400,000,000 of bonds in Europe, upon which it is compelled to pay $84,000,000 per annum, by way of interest, in gold. If it were to accept legal tenders for customs, where would it find the gold to pay this annual obligation? The second misstatement is, that Government paper, or promise to pay, has no intrinsic value. Whatever it will fetch in the market; whatever it will purchase; whatever it can be exchanged for—expresses its intrinsic value as money, for the time being. Its value is fluctuating, but this is more the result of Wall street cornering operations than from any increase or decrease in its actual value by reason of legitimate supply and demand. We also find the following paragraph in the same article: "Perhapa the first step toward relief would be gained by a national issue of demand notes for the accommodation of all persons who chose to deposit specie in the Federal Treasury." But, if a person has specie, what does he want with the notes? What relief would a note give him more than he already enjoys in his coin? And, if he have no specie, where is he to get a demand note? The volume of paper currency afloat is already sufficiently large; too large to be as valuable as it would he were it smaller. The one great trouble consists in its deficiency of purchasing power when compared with coin; and much of this defect is a result of its volume.

The demand for money is active, and more is going out than coming into bank. Rates on first-class indorsed paper, for call loans, are 1¼@1½ per cent. per month, but on the street the range is 2@2¼. Bullion is in light supply, with small demand. We quote gold hara at 850; silver hars, from par to ¼ per cent. off; currency hills on Atlantic cities pay 28@28⅛ per cent. premium on gold; coin sight drafts, 1⅛ per cent. premium; telegraphic transfers, 2 per cent. premium; sterling exchange, 48¾d.; commercial hills, 49½@49⅝d.; Mexican dollars, 4⅛@5 per cent. premium; gold in New York, Oct. 21at, 131; sterling exchange, 109¾@109¾; legal tenders in San Francisco, 75½@75¾.

Many of the New York and Brooklyn merchant princes have got Mr. Boutwell after them with sharp research into their incomes. It seems that great discrepancies exist between the exhibits they have furnished to the assessors of the places where they do business and the exhibits given to those of the places where they dwell, and these facts coming to the Secretary's knowledge, he has ordered his collectors to hunt up the matter and compel just returns. In pursuance of this order, the collectors have obtained results showing that many merchants have made sales to the extent of $200,000 and $400,000, while they gave in their incomes at $4,000 to $6,000 per annum. These sums are not regarded as sufficient profits on such extensive sales, and strict examinatiou is to he had for the purpose of determining whether they sold those goods helow cost, at cost, or for so trifling a profit as indicated in their income exhihits. The Secretary will not confine his investigations to New York and Brooklyn, but will extend them to other cities. The Income Tax has always heen ohnoxious to our ideas, hut so long as it exists and the law is in operation, let it he strictly enforced, especially against those who are most able to comply with its requirements. The same argument is applicable to usury laws. Some time ago an attempt was made to enforce the usury laws of New York State, hut it was met at the outset with all sorts of opposition from leading financial journals, which denounced the suits instituted by the authorities as unjust and oppressive, hecause no previous effort had ever heen made to give it practical effect. Nothing daunted, the authorities remained inflexihle, and the cases were brought hefore the proper tribunal. Immediately, the same journals commenced a series of special pleadings that mercy should he extended toward the culprits; that they should he let off easily, and the law permitted to fall upon them like a gentle snow-wreath. We are sorry to add, that these petitions found weight, and the usurers were allowed to go with merely nominal penalties. Then followed the logical result: The law was made a farce of and laughed at. The same culprits again entered the field and recommenced their operations on a scale of magnitude never hefore known in our financial system. The whole husiness of the country was arrested, and serious injury done to many important interests. We know of no steps heing takcn to enforce the law.

From Europe, we learn of some commotieu in the financial circles of England. Mr. Lowe, Chancellor of the exchequer, has submitted a proposition to dehase the gold coin of the realm hy decreasing the quantity of gold in the sovereign from 113 to 112 grains, which has elicited sharp and decisive criticism from leading financial men, prominent among whom is Lord Overstone, hetter known as Lloyd Jones. The Chancellor has also proposed that the cost of mintage and a charge of one per cent., under the title of seignorage, shall he deducted from the coin itself; and this proposition is sought to he supported hy the fallacious doctrine that although one grain of gold shall he taken from the sovereign, its purchasing power will remain undiminished! This is queer doctrine to emanate from so high a functionary, and indicates no very great possession of common sense. It is like taking one eye from a man's head and declaring that his power of vision remains unimpaired. The returns of the Bank of England for the week ending September 29th show a diminution in hullion to the extent of £1,192,093, as compared with the returns of the previous week. This indicates a greater activity in the money market, probably caused hy harvesting the crops, which are reported fair, in general, with less than an average in wheat. The stock of hullion in the Bank of France, at the close of September, was equal to $245,000,000, in round numhers.

City Stocks.

The market for miscellaneous securities has been quiet since our last similar reference. Small sales of Spring Valley Water Co. stock were made at $62 75@62 25, and San Francisco Gas Co. at $84 50@85 per share. A sale of 44 shares Pacific Union Express stock is announced at $1 per share.

Mining Share Market.

The mining share market exhihited considerahle activity since our last issue, a numher of prominent stocks having improved over closing quotations of last week, while as a general thing no material recession has characterized the list usually dealt in. Sales have also augmented, the largest transactions embracing Chollar-Potosi, Savage, Sierra Nevada, and Yellow Jacket.

CHOLLAR-POTOSI—has improved some, under large sales. During the week ending October 15th, 965 tons of ore were extracted, against a yield of 1,000 tons the previous week. The drift running north-east on the 18th floor shows the same streak of ore found on the track floor of the new tunnel, the vein at this point heing six feet wide. The connection with the track floor of the new tunnel was made on the 18th. The huildings over the shaft have heen completed, and the hoisting works, it is expected, will he in running order in the course of a few weeks.

HALE & NORCROSS—exhihits quite an advance toward the close, the sales heing on the increase. The report for the week ending October 16th shows an ore product of 1,265 tons, against 1,206 tons the previous week. Of the 1,265 tons, 449½ were from the upper mine, and 815½ from the lower mine. The station at the sixth level is nearly completed, and a drift westward for the vein will he immediately carried forward. A drift has heen started north to cut the vein at a point north of the shaft. The various hreasts throughout the mine are reported as looking well.

GOULD & CURRY—was in less request than the previous week. For the week ending October 18th, 314½ tons of ore were extracted, against 359½ the previous week. The Old North mine yields most of the ore extracted, the quality heing hetter than was expected. At the seventh station the drift south is 135 feet in length, and the drift running north 85 feet. No indications of ore.

SIERRA NEVADA—was in the market to a large extent, rising to $18 50, then falling to a considerahle extent. They are upward of 35 feet in the vein, which is reported to show an average width of ten feet.——The main drift of the OPHIR mine is upward of 735 feet in length, and the northwest drift has heen extended more than 170 feet.——CROWN POINT levied an assessment of $7 60 per share on the 15th inst.——IMPERIAL reports a hullion return of $14,536 for the month of Septemher.——BELCHER levied au assesament of $2 50 per share on the 21st inst.

From the White Pine *News* of the 16th inst. we learn the following improhable report regarding ons of the most promiuent White Pine mines:

"AURORA CONSOLIDATED—sinking a shaft in the upper works, Aurora North, to he tapped hy the tunnel from the North Iceberg. Down nearly 100 feet, and expect to complete the connection in ahout a week. This will be a valuable work, ohviating the now existing necessity of teaming away up ou the steep side of the mountain. After this connection, the ore will all he delivered, for years, from the tunnel, on a level with Union street. Gov. Blasdel sold these mines, a few days ago, for $237,000, coin, to Capt. Frank Drake. The sale covers, under the Aurora Consolidated, the following mines: Aurora North, Earl, Ward Beecher, North Iceberg, and one or two others. A strike of extraordinarily rich ore was made, a few days ago, in the works of the Autumn Company, which was lately ousted hy law. Samples of the ores range from $5,000 to $8,060—the latter, of course, choice selections.——The EARL mine, helonging to the Aurora Consolidated Company, is still taking out 35 to 40 tons daily of ore, which requires no asserting, hut is sent to mill as mined. This amount is taken out while sinking, and the heat is on the hottom. The mine is now one of the very hest, if not, at present, the very best in our list. CONSOLIDATED CHLORIDE FLAT is shipping large amounts of ore, as usual, to the Manhattan mill. The hullion yield of the mill is an average of $1,700 to $1,800 daily and has been for the past two months.——ORIGINAL HIDDEN TREASURE continues shipping ore to the Dayton mill, and raising ore from two different places in the mine—the North Open Cut and the South Incline—a hetter average grade of ore than ever hefore, requiring less work in the assorting.——The NOONDAY shaft is down 100 feet, and a drift east somewhere ahout 80 feet, where a large hody of excellent ore was encountered."

THE Glasgow Iron and Metal Importing Company is one of the solid institutions of this city. Their supplies on hand at Nos. 21 and 23 Fremont street, are large and first class, embracing, among other articles, bar and bundle iron, cast steel, plate and sheet iron, boiler flues, pig IRON, gas and water pipe, Cumberland coal, etc.

ASSAYS and reliable working tests of ores can be had of G. W. Strong & Co., No. 10 Stevenson street.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Leviathan.—*Chronicle*, Oct. 9th: Capt. Jones arrived on Monday from San Francisco, where he completed arrangements for smelting works. These works consist of a 15-horse power engine, a blower, three furnaces and a portable sawmill. The firebrick necessary has been shipped with the machinery, and will be at the mine in a few days. The engine arrived at Reno on Wednesday.

The Mountain.—The work in this tunnel is progressing finely, and never have been so flattering. Small strata of quartz are cut almost daily.

Tarshish.—*Miner*, 9th: This company is making a start at the main tunnel, and will be under full headway in a few days.

Good Work.—The No. 3 tunnel of the M. C. M. Co. has been pushed in this week so far, at the rate of over 20 ft. for the full week, working only four men. As the ore increases in the rock it becomes softer and more friable.

Indications in the Imperial tunnel are said to be flattering. The Florence lode is nearer than was estimated.

The Mountain No. 1 tunnel is 1,707 feet and the indications, according to the Supt., flattering.

Copper.—Wm. Willis, in Hope Valley, shows us copper matte in a blacksmith's forge, out of ore from his vein.

AMADOR COUNTY.

Hinkley.—This mine has passed out again. Some weeks ago, two of our miners made an agreement to work it on shares—they to receive one-half after paying expenses. Last week they struck a "pocket" from which they took out over $1,600. This mine has already yielded over $16,000.

MARIPOSA COUNY.

Bear Valley.—*Gazette*, 15th: We are informed that the parties running the tunnel at the Maggie Russell vein near Bear Valley, have, after going 100 feet, struck a 3-foot vein with promising indications, the quartz exhibiting free gold. Should the prospects hold out, a mill will be erected.

NEVADA COUNTY.

Slate Creek Ledge.—*Gazette*, 12th: A crushing of ninety-one loads at Perrin's mill cleaned up on Saturday, yielded $5,271.35. The cost of mining, hauling and crushing the rock was $591.50, leaving a profit of $3,679.85.

William Penn.—15th: This mine started up on Monday, having been shut down for several weeks for the purpose of putting in new pumping machinery. The company now propose to sink the shaft 100 feet below the present level, which is 164 feet below the surface.

Mill to be Moved.—Layton will move his quartz mill at Union Hill to the Greenhorn claim six miles east of Grass Valley. Three hundred tons of rock from this claim was crushed within the last year at Layton's mill and paid well. The ledge is from three to four feet wide.

George Batter's Gold Mining Co.—This company has been organized for the purpose of working the ledge on Wolf creek, one-fourth of a mile west of Union Hill, located several years ago by J. K. Sale.

Meadow Lake, 18th: Churchill and Doling have erected a furnace and mill. The first crushing was two tuns of ore from the Wisconsin mine, which yields nothing by the ordinary process. By the new process, the two tons yielded over three and a quarter ounces, which assayed .917 fine, and amounted to over $62. The ore is first roasted, and then crushed in a battery, and the cost of reduction will not exceed eight dollars a ton. Encouraged by this success, the Mohawk and Montreal Company have made arrangements to erect three furnaces on the same plan.

Deer Creek.—*Transcript*, 12th: Mr. Stranahan has forty-five men digging ditches, and fitting up claims, and proposes this Fall and Winter to run three sets of diggings. The Red Diamond and other claims in the vicinity are looking well, and only require water to make them pay.

Pittsburg.—Same of 15th: On Wednesday, four tons crushed, paid $199 per ton in free gold, and yielded a ton and a half of sulphurets, which assay $250 per ton. The lead is better than ever, and is becoming larger.

American.—Sweetland Cor. of the *National*, 11th: This mine has, in addition to the latest improvements in hydraulic mining, three mills. One is an eight-stamp mill to crush cement; the other two to grind sand and gravel. In this mine 300 and 400 kegs of powder are frequently exploded. The company are now running two drifts, the main one of each being 100 feet, and the arms 50 feet each way, forming a T; and in each of these they intend to explode 500 kegs of powder. A new tunnel is being run, which will be 5,000 feet in length, and will cost nearly $60,000. It will be 200 feet below the present tunnel on the bed-rock. The principal owners are Croll and Brown. The average clean-up is $25,000 a month.

Buckeye.—Same: The average monthly clean-up is $12,000. The mine is divided into ten shares, of which Evans and Stidger are the largest owners. The company have just completed an extension of their tunnel, and have raised a new shaft. The tunnel is 1,200 feet in length. Negotiations are pending for the sale of this mine to a London Company for $200,000. Persons acting for the London Company have four months in which to consummate the purchase.

Manzanita.—Same: This mine, formerly known as the "Kentucky," owned by Houston, Firth, Judson and others, is the largest in the vicinity, comprising in all 180 claims, and presenting a perpendicular face of 4,000 feet in length and 150 in height. It is not paying so largely, however, as some of the smaller Sweetland claims, the average clean-up being only $3,000 a month.

Tail Sluices.—Same: The Buckeye have some extensive sluices, which catch the water from three mines, "Manzanita," "Chinese" diggings and the "Buckeye." The average clean-up is $1,200 a month.

Wisconsin Mine.—Grass Valley *Union*, 13th; The new mill will start up to-day. There are eight stamps, with room and shafting for eight more. The ledge is looking well, growing in width as the miners go down.

PLACER COUNTY.

Rich Specimen.—*Stars and Stripes:* Wm. Quick, of the Evening Star quartz mine at Rock Creek, had on exhibition at Gordon's store last Sunday, a magnificent specimen of gold and quartz, two inches in length, and nearly 1½ inches in thickness. A large amount of free gold was taken from the ledge that day, though the specimen referred to was the finest for exhibition.

The *Herald* of the 16th quotes this, and adds: We are informed since our neighbor penned the above, that the last four pans taken from the shaft averaged $400 to the pan, and that the refuse quartz taken from this mine will mill, ordinary average process, full $50 per ton. Gen. J. B. Taylor, Wm. Quick, Heenan & Co., are the owners of the claim.

Quartz Mill Burned.—On Wednesday Menter, Laraby & Co's 6-stamp quartz mill on Crosby's ranch, near Whisky Diggings, was completely destroyed by fire, including the chlorination works. It is believed to be the work of an incendiary.

PLUMAS COUNTY.

Good Pay.—Quincy *National*, 9th: Barker, Wilbur & Bradey, on Mill Creek, some two miles from his place, cleaned up this week, for a 30 days' run, $609.69.

SHASTA COUNTY.

South Fork Mines.—Red Bluff *Sentinel*, 9th: These mines in Shasta County, 30 miles from this place, are again attracting attention. There have been numerous tests made during the summer, and in no case has the yield been less than $40 per ton, and generally from $200 to $800, and some as high as $2,000 per ton. There has been considerable of this rock sold for shipment to Europe for from $200 to $400 per ton, delivered in San Francisco. We have been informed that a San Francisco Co. have proposed to put up a mill with 15 stamps, with capacity for 40, which they would add as soon as business demanded; provided, the miners and claim owners will present them with 1,000 tons of rock as a bonus. The company then agreeing to make it a custom mill, and run exclusively on custom work for $25 per ton. Mr. Rothwell, one of the oldest miners, informs us that there is but little doubt the offer will be accepted, as the miners propose to do the work of taking out the rock free of charge, if the citizens and others interested in the development of these mines will but furnish them with tools, powder and provisions.

Clear Creek.—Same of 16th: The news from these mines is cheering. Mr. Higinbotham informs us that a new ledge has been struck, which promises to be the richest in that district.

TRINITY COUNTY.

East Fork.—*Journal*, Oct. 9th: At the mouth of Rich Gulch, Mr. Engle has an arastra, where he crushes the quartz from the ledge found two years ago. The vein is a half mile distant upon the mountain side and shows very rich rock. In almost any of the quartz piled up for crushing, gold can be found, and in many pieces it is visible.

Water Across Trinity.—McGillivray is taking water from his Cañon Creek ditch across Trinity River to supply his sawmill and mining claim. The water is to be conveyed through 15-inch iron pipe over a wire suspension, at a point some distance above his residence. About 2,000 ft. of pipe will be used.

New River Country.—Same of 16th: The mines commence three or four miles from the foot of the mountain, and extend nearly to the junction with Trinity. There are not over a dozen white miners in the whole New River country, and they are scattered in companies of two and three over a range 20 or 25 miles long. There are plenty of places good for small wages—say from $2 to $5 a day, but the old settlers prefer generally to prospect for something better. There are a few Chinamen near the forks with their rockers. Five miles below the forks, Mr. Caraway has found a quartz ledge which prospects very well. There are indications of paying quartz in several places.

Rattlesnake.—Cristiansen & Co. have a big claim, and will do well when water comes.

Minersville.—We learn that work is being done on the Little Mule Creek, where the big strike was made last winter. Weeden & Co. expect to realize pay soon.

The Big Flume.—The flume will be completed as far as was contemplated this season in ten days or two weeks.

TUOLUMNE COUNTY.

Confidence Mill.—Sonora *Democrat*, 16th: The clean-up made on Saturday yielded $4,300, for a run of six days.

YUBA COUNTY.

Pennsylvania Mining Co.—*Appeal*, 14th: The Trustees having ascertained the amount of liabilities, have rescinded the assessment of $2 per share, and levied another one of $5, which will liquidate the entire indebtedness.

Arizona.

The Prospects.—Prescott *Miner*, Oct. 2d: Although, at present, there is not a mill nor a sluice running in this immediate vicinity, we wouldn't trade the Sierra Prieta and its mines for White Pine and the balance of Eastern Nevada. While not to exceed sixty miles in length, and twenty-five in width, it is know to contain at least one hundred quartz lodes of sufficient richness to pay handsomely for working. It is covered, from one end to the other, with a thick growth of timber, is tolerable well watered, exceedingly well grassed, and is blessed with a healthy climate. Until recently, not a single *miner or mill man* has visited us. Mills were erected in a manner that was better calculated to lose gold than to save it. We now feel that a more intelligent era has opened. By persistent effort we have succeeded in attracting considerable capital and sufficient brains to the country to demonstrate that quartz mills can be run with profit. We have great faith in the future of our Territory.

Big Bug Mill.—Steam will be raised in a day or two. Mr. Heslep thinks he will encounter no difficulty in making the ores pay handsomely. Messrs. Hitchcock, Gray and Wunderlich are now at the mill.

Wickenburg.—Mr. Grant says that both the Wickenburg mills were running and paying well when he left there.

Yellow Pine and Clarke.—The Visalia *Delta* confirms the last week's report, and adds that there is an abundance of wood and water within reach of the mines.

The *Arizonian* says: The mining excitement is still at fever beat. Numerous mines are said to have been discovered, and from specimens which we have seen, we are convinced that at least *some* very rich mines have been found. Several parties are still among the hills prospecting.

Idaho.

Loon Creek.—*Statesman*, 7th: Marion Clark, just from Oro Grande, says he is satisfied that the new discovery is better than Loon Creek, and more extensive. Dr. Wilson of Placerville, told Mr. Clark that there were four or five creeks putting into the main stream, all of which prospected well. They got in the bills fifty to sixty cents to the pan. Dr. Wilson considers the prospects as good as those of the Basin when first discovered. The miners who have got on the channel are taking out big money. Clark says he knew a man who bought an unprospected claim down the creek for a hundred dollars, and in a short time after sunk a hole, and panned out his hundred dollars, all in one day. Mr. Clark is not an excitable man, but inclined to "go slow;" and he is of the opinion that it will next year be *the* mining excitement of the Pacific coast.

Same of 12th: Our correspondent writing from Oro Grande October 3d says: In claim No. 28 they struck a prospect yesterday of $20 to the pan.

The last report from the Yellow Jacket excitement was to the effect that the whole thing was probably a bilk. The 300 stampeders had as yet found no pay.

Alturas County.—Letter to same from Rocky Bar: At Bonaparte Hill, Mr. Lincoln has completed a satisfactory run of 50 tons from the Ebel mine, and gone to New York for the winter. Mr. L. keeps the result to himself; but parties who worked for him and saw the amalgam, say it was about $50 per ton. M. G. Moore is crushing ten or twelve tons of the richest ore I have seen for many years. It is from the old Idaho, and will average $130 to $150 per ton. G. F. Settle is getting out ore from a ledge on Idaho Hill that will pay at least $100 per ton. Mr. Settle expects to keep at work until the cold weather stops him, and will make a handsome little stake yet this fall. Guss. Kraner will crush a few tons from the Hard Up, said to be very rich. L. C. Shearer, J. D. Goodrich, Wm. Miller and Mr. Wakefield will all do a little something in that line this month, while Jackson, Bailey & Wheat will bring up the rear, and close operations for this fall on Bear Creek.

Red Warrior.—Same: The Wide West mine never looked so well as now. They have a solid ledge of very rich quartz in their lower level, which one of the workmen told me covered the entire width of the stope. The mill starts up to-day, and will run all winter if good miners can be hired in sufficient numbers to keep it supplied with ore.

Atlanta and Yuba.—Same: The Monarch Co. on the Atlanta ledge and private parties on the Leonora are at work. There are, I am told, negotiations going on now for the purchase of quite a number of these Yuba mines, by foreign capitalists, for cash. Wm. Clemens is still working his arastra, crushing ore from the Minerva and making plenty of money. J. D. Heath, J. B. Barnhart and others, are also doing work.

Owyhee.—*Wave*, 14th: The Allison mine is producing an extra quality of rich rock. Captain Richards, the foreman, has made all his underground connections, according to calculation, and the ground is in good shape. In the Keystone, the rock already taken out, amounting to about two tons, makes a creditable showing in black sulphurets, as well as an occasional spot where free gold is visible. The shaft is quite large, and is now down some four feet below the surface of the bed rock in the creek, and exposes a ledge of two feet.

Montana.

Huge Nugget.—Helena *Gazette*, Oct. 7th: We were shown a nugget which weighed 50 ounces, worth $900, taken out of the claim of Marks, Cooper & Co., on Thursday last, in Confederate Gulch. This company have for a considerable time past found chunks of gold varying from five to fifteen and twenty ounces, but this throws all in the shade.

Mining Ground Laid Over.—At a meeting of the miners of Tucker Gulch, Pine District, held yesterday, it was resolved that all the claims be laid over until the first Monday in May, 1870.

Premium Quartz.—The Territorial Fair judges awarded the first premium for the richest silver-bearing quartz to specimens from the S. C. Day lode, in the Moose Creek District, near Highland. The owners are Dr. S. C. Day and B. S. Harvey. The lead has been sunk on 100 feet, and some of the picked rock has yielded by working process, as high as $1 to the pound—$2,000 to the ton.

New Discoveries.—The scarcity of water has set our miners prospecting. Hence the late strikes. The new digging on the Boulder are somewhere on the south side of the valley. In a tributary of Mitchell's Gulch, miles of claims have been staked off, and although water is very scarce, we are informed that most extravagant returns have been made in a few hours' work with a common rocker; even one pound troy has been mentioned as the run for two hours. We think there need be no fear on account of the future of Montana.

Phillipsburg.—Cor. of *New North West*, Oct. 8th: Work is slowly progressing, and considerable very rich ore coming out. Saunders' Mining Co. have employed a force of men on the Speckled Trout, and commenced operations to-day. They are erecting a crusher and separator. After dressing, the rock will be sent East for smelting.

Nevada.

COPE DISTRICT.

Ore.—Elko *Independent*, 13th: On Monday, 1,200 pounds of fine ore were shipped to San Francisco by the freight train. It is from the Mountain City mine, and will probably work $1,000 per ton.

Mountain City.—Same, 16th: Late advices are encouraging. Building is going on rapidly. The mines are developing well, and late discoveries are reported that bid fair to open into handsome mines.

The Mountain City correspondent of the Silver City *Ware*, Oct. 14th, says: Mr. Lytle, of your town, is bringing in a ditch to supply the placer mines. It will soon be completed, and will cost $10,000. He has also opened a toll road over the mountain. Dick Tregaskis is here. Drow & Co.'s mill is on the way. The population of this town and neighborhood is some 700. Goods are coming in and provisions are abundant. Plenty of firewood $8 to $12 per cord.

MINERAL HILL DISTRICT.

Quick Returns.—*Independent*, 12th: The mines of Mineral Hill have already returned to their owners over $23,000. Of this, $6,000 was from float rock, picked on the hill side by Indians, hired for the work. The ores have been hauled to Austin for reduction, and the cost of mining, hauling and reducing has only been eighty dollars per ton.

Ore from Mineral Hill.—*Reveille*, 16th: This morning John Sheehey laid upon our table specimens from the Live Yankee. The ore exhibits chloride of silver. Mr. Sheehey informed us that the company had sent nine tons, selected from the same number of claims, to the Manhattan mill in this city for reduction, the yield of which was at the rate of $350 per ton.

REESE RIVER.

Troubles.—The *Reveille*, of the 14th, summarizes the bad luck of Austin in a column editorial. Just as the place had got over White Pine and the Railroad, and had begun to move forward again, the Bank stopped. This was a stunner. But she rallied. Then the Lane & Fuller property was sold, and its mines and mills were closed, throwing more than a hundred men out of employment. Next, the President of the Manhattan Co. telegraphed from New York to stop work "until taxes and labor be reduced." A hundred and fifty men were deprived of work by this. The reason of the move is not apparent. It may mean a reduction of wages, or a long idleness followed by introduction of Chinese labor. Time will show.

Trojan.—It is said that this mine, which has been some time closed, will be opened to-day.

Works to be Shipped.—The contract for shifting the hoisting apparatus, etc., from the grounds of the Stranger mine to those of the Toiyabe Company, has been awarded.

Bullion.—18th: During the week ending Saturday, the 9th inst., the following amounts of bullion were produced: Manhattan mill, 16,880 ounces; Mettacom mill, 12,600 ounces.

WASHOE.

Succor.—*Enterprise*, 17th: This mine is improving rapidly. In the lower tunnel a day or two since, they struck a body of ore six feet in width, which works by gold process $20 to $22 per ton. The company will be able to pay dividends in 60 days.

Crown Point.—No ore is being taken out at present. At the 1 000-foot level a small streak was found; at the 1,100 level they drifted up against the east wall and found nothing. The pay streak has evidently taken a "slant."

Occidental.—Good progress in the lower tunnel. They are running in ledge matter, that is rock inside of the fissure, and occasionally strike detached streaks and branches of ore. Some of these assay as high as $60. In their upper works they have lately struck ore, the best ever found in the mine.

Lady Bryan.—In the Lady Bryan a very rich and important development has been made in a cross-cut to the west from the end of the south drift. At this point they have cut into a magnificent body of ore to the distance of 10 ft., and were not yet through it yesterday. They are crushing from this body of ore in their own mill, and assays of pulp from the battery run up to $60, and the yield will be about $40.

Sierra Nevada.—The white ledge struck in the winze from the car track level appears likely to prove valuable. It contains much free gold. In the southwest drift magnificent ore has been found.

Irving.—Work will probably be resumed shortly, as we observe that M. L. Winn, the principal owner, has invented a shampooing machine, the like of which has never before been seen.

Chollar-Potosi.—In this mine rather more than the usual amount of ore is being raised, and it has much improved in quality. The new hoisting machinery is being set up.

Ophir.—The Ophir, night before last, struck a stream of twelve inches of water. This, however, will prove no obstacle to the work.

Hale & Norcross.—A station has been established on the 1,200-foot level. About 160 tons of ore are being taken out per day. The vein cut by the east drift on the 500-foot level is improving.

Alpha.—The Company are running a drift north from the 1,100-foot level of the Imperial. The distance to run is 130 feet.

Savage.—The rock is hard. Drifting north and south on the ledge is still carried on. They are taking out from 60 to 80 tons of ore per day.

Virginia Consolinaten.—The shaft had reached 340 feet yesterday. The rock is becoming softer, though blasting is necessary.

Bullion.—No strike has been made; though they have an immense body of quartz. They are drifting about through the vein in search of ore.

Overman.—At the 400-foot level this mine is yielding ore that assays $40 per ton. At the 500-foot level the ore is looking better, and a small body lately found in the 300-foot level promises well.

Caledonia.—Work is about to be resumed on this old mine, situated some distance below Gold Hill, on the Comstock range.

WHITE PINE.

Weekly Mining Review.—*News*, Oct, 16th: Mine managers are preparing for winter. Additional teams are put on continually, and the loads of ore going to mill are wonderful, for bulk, number, and richness. Mill men wish to increase the stock of ore at their own dumps, from the over-fattened piles on Treasure Hill. However, if sleighing is good, teaming will be easy, the grade being in most cases descending.

The *Empire* of the 17th, says: Several strikes have been made during the week. National Tunnel, above Pocotille Flat, penetrated Treasure Mountain 270 feet, and struck good ore 350 below the surface. The Eastern Slope, near by, is also in ledge matter which promises well. Later, ore assaying $5,000 per ton was struck by the Aurora South in the Autumn pit, and yesterday the Potts, below the Rice grade, struck a fine deposit, after passing through 120 feet of solid slate. The ledge has been penetrated two feet, and the strike is one of the most valuable made for some time.

Bullion.—*News*, 16th: Shipments for the week light—$14,647.61 from this city and $13,240.41 from Hamilton and Shermantown—$27,888.02 in all. Large shipments last week, and several large ones to make in a few days, leave this week's export less by two-thirds than usual....*Empire*, 11th: Our bullion shipments, aggregating $53,473.21, fall a little short of last week's work, but the amount of silver awaiting shipment and in pulp at the mills will more than make up the deficit.

Items.—*Empire*, The Fay mine difficulties are settled....The Maria Louise ore yields $225 to the ton in bullion in silver, besides the lead....The Radical shaft is down 65 feet, and 100 tons ore on dump. The Montez, on Argyle Hill, shows a magnificent mine of 21 feet in thickness with perfectly defined walls, and the whole body of ore will pay in the mill from $65 to $90 per ton....Aurora Consolidated extracts 75 tons ore per day, and ships most of it to mill....The Earl shaft, down 85 feet, has $65-ore in sight for 12 months' work. ....Tregloan's mill will start up on Iceberg ore in a day or two....The Consol. Chloride has 1,600 tons of $55-ore on dump at the Manhattan mill....Pogonip and Othello ships 12 tons of ore to mill daily. On the dump it has 1,000 tons....Kobler mill will add another 10 stamps. The machinery is already on the ground....Eberhardt sacks 16 tons ore daily. Crushes 12 tons daily, worth $110 per ton....The Oasis mill turned out $33,000 last month in silver bricks.

New Mexico.

The New Placers.—Santa Fé *Post*, Oct. 2d: Ex-Gov. Mitchell arrived on Monday, and brings encouraging news from the placers. The Governor represents the Candelaria Mining Co. He brought with him the result of three days' labor, which was 47 oz. 7 dwt. and 6 grs. of gold, valued at about $1,000, taken from 21 tons of quartz. The company's base of operations is at the New Placer, in this county, 36 miles from Santa Fé.

Jules Favre has been swindled out of 5,000 francs by a confidence man. Parisian confidence men will find no Favre henceforth.

Agricultural Manufacturing Establishments in Alameda County.

Foundry and Shops of Davidson & Co.

During my journeyings last week, I visited the above named establishment at San Leandro, Alameda Co., where the *Eureka Self-Raising Gang Plow*, and several other useful farming implements are made. Mr. G. A. Davidson, the inventor and patentee of this gang plow, claims superiority over all other gang plows in several particulars, and I was so interested in his ingenious devices that I will attempt a description of them. The frame-work, seat, etc., differs little from common gang plows. The advantages are: 1st. The lightness and strength combined are certainly most desirable. 2d. The axle is straight, with arms which attach to the frame, for raising and lowering the plows. 3d. To plow at any desired depth, and *run the plow level*, the axle on the land side can be raised or lowered in a perpendicular slide, easily graded with a set-screw, without changing the set of the axle. 4th. To raise the plows from the ground without the exercise of muscular force by the driver, the lever attaches with a clutch, which instantly connects the axle with the hub by a slight inward movement which any boy can apply, when the motion of the wheel turns the plows out of the ground, and a curved slide opposite the ratchet throws off the grapple and fastens the lever in the ratchet at the same time. It will be seen that this relieves the driver of the heavy work, and allows him to give his whole attention to his team, in turning at the ends of furrows, at the very moment when it is most required.

Davidson & Co. evince that energy that deserves and will win success; and their work is but to be seen to be appreciated.

Baker & Hamilton's Works.

I also visited the establisbment of the above named firm, at San Leandro, and was much surprised to find so large a manufactory of agricultural implements on this coast. The scene presented in the shop is an extremely busy and interesting one. The building is about 100x200 feet in size, and comprises a foundry, blacksmith shop, machine shop, and wood-working department. Another building across the street is used as a paint shop. About forty men are employed altogether. The fires in the blacksmith shop—ten in number—are supplied with a power blast, and being placed in a row with twenty men hammering away in front of them, present a very cheerful and business like aspect. The foundry employs five men. In the machine shop, we found the usual supply of lathes, drills, screw-cutting machines, punches, shears and the like. In the wood shop I saw an excellent Gray & Wood's Planer, two completely equipped circular saws, a jig saw, a boring machine with an improved table, which can be adjusted to allow of boring in any conceivable direction or at any angle or depth, and last, though not least, a machine for boring out the hubs of wagon wheels, for the reception of the boxes. This machine appeared to me to do its work in an unusually satisfactory manner. It bored the hole exactly in the center of the wheel (not the center of the hub necessarily) and any desired taper to fit the box and precisely square to the face of the wheel, besides cutting the recess in either end of the hub for the nut and washer. The machine was gotten up in the shop by one of the workmen, Mr. J. Shepherd, and saves the labor of at least five or six men. A steam engine is the motor.

The company are engaged chiefly at present on the Sweepstake Gang Plow (from which it takes its name), spoken of at length in a late number of the Press. We were assured by the foreman that they had one thousand under way, and that nearly that number were sold last year; and that at present, even with their large force, they were behind their orders. In addition to gang plows, they manufacture hay presses, cultivators, single plows, an improved broadcast seed-sower, harrows, etc., etc. The establishment is owned by Baker & Hamilton, hardware dealers, of San Francisco and Sacramento, who for their energy and enterprise deserve their well-established success.

Smyth's Shop at San Lorenzo.

We next stepped into the shop of Mr. Henry Smyth, at San Lorenzo. Mr. Smyth is one of our oldest and best mechanics, and his inventions are among the most worthy we have seen. Established as early as 1853, he has been constantly engaged in repairing, manufacturing, and in improving agricultural implements. With a good steam engine, and much other excellent machinery; he runs five fires, and employs 17 men. So well known and appreciated is his work, that he is crowded to supply the increasing demand. He has no agents, but disposes of everything at home.

Mr. Smyth is the inventor of a gang plow that deserves more than a passing notice. It has a double crank axle, and the ordinary frame. The novel features of this gang plow are: 1st, To regulate the level at any desired depth on the land side, is a clutch connecting the crank with the axle, which allows the axle to be raised at will, and it is confined in place by the axle nut. 2d, For raising and lowering the plows, a crank lever with an endless screw, connected with the axle by a gear wheel. This is worked with great ease and accuracy, and will grade the plows to cut deep or shallow.

Another invention of Mr. Smyth's is a very simple application of a lever to his cultivators, for instantly raising or lowering them at pleasure. He also makes single plows, harrows and farming tools.

Another invention of Mr. Smyth's interested me. This is his self-regulating climax side-hill plow. As he is about applying for a patent, I will forego a description at present; but I confidently assert that it throws other side-hill plows in the shade, and must eventually supersede all yet invented.

I would like to give a glance of what I saw in this region of fine residences, gardens, orchards and fields, but the length of my article forbids. S. H. H.

The Pepper Tree.

We are indebted to Dr. J. G. Cooper for the following account of the "Pepper Tree," so called, which is so common in many parts of this State,—written expressly for our columns:

This beautiful and useful tree is a native of Peru, and has been known to botanists ever since the time of Linnæus, the father of botanical science. He named it *Schinus Molle;* the generic name being adopted from the Greek title of the Mastich tree *(Pistacia lentiscus)*, the specific from the native name of the tree in Peru, viz. "*Mulli.*"

In naming the genus after the Greek tree, Linnæus showed his scientific acuteness, which was always in advance of the knowledge of his time, for the pepper tree is closely allied to the mastich tree, though, according to the *artificial* Linnean system, it belongs to a different order, having ten stamens instead of five.

It is now placed in the same *natural* order, that of Terebinthaceæ, which includes the *Pistachio Terebinthus*, or Venice turpentine tree, and *officinalis*, producing Pistachio nuts, also the Casbew nut tree of India, and the walnut tree of the temperate zone, besides the Sumachs and many more tropical genera. They all agree, among other things, in producing an aromatic resin, of which the balsams of Tolu and Peru, gum elemi, gum mastick, Copal and Japan varnishes, and frankincense, are the most remarkable. The gum resin of the pepper tree is used in Peru for making a dentifice, and, like the leaves, has a powerfully stimulating effect on the throat. The fruit is a red berry, enclosing a large seed, which, when dry, is powdered, as a substitute for black pepper. Though nearly resembling pepper in appearance and taste, the plant producing that spice is not at all related to this, botanically, or in appearance, having more the form of the Calla or Ethiopian lily, and growing only in the tropics.

The Peruvian pepper tree has been carried by the Spanish colonists to most of their settlements in America, and has become apparently naturalized in Mexico. According to Loudon, it has been cultivated in England since 1597, and even there grows in the open air. It possesses one valuable property to our climate, being able to stand one long dry season without maturing, and will be a beautiful ornament to our future hedges.

Local and Original Music.—Mr. A. A. Rosenherg, our enterprising music dealer of No. 139 Kearny street, has published, among others, the following new pieces:

Fair Galop, by F. Zikoff.

La Belle Julier, by A. A. Rosenherg.

All the Rage Polka, by A. A. Rosenberg.

These pieces are highly spoken of, and we are glad to note that Mr. Rosenherg's enterprise in this direction has met with a good degree of success, sufficient, we hope, to continue his original local publications. Such home enterprise is worthy of encouragement by all who appreciate talent and good music.

San Francisco:

Saturday Morning, Oct. 23, 1869.

Notices to Correspondents.

"Frog Spittle."—O. P., of Guenoc, Lake County, California, a shepherd, sends us sheets of "dried frog spittle," from a dry valley near the head of Putah Creek. This, he says, is "deposited by the female frog with her eggs for the future food of the young tad-poles." Being a very pure, white, natural felt, or paper, he suggests that it might be turned to good account by some of our ingenious mechanics and industrial economists. This substance was described and considered at length in the Mining and Scientific Press three or four years ago, with respect to its adaptation for paper manufacture. It is of vegetable origin, being found in great quantities on the alkali plains of Nevada, where frogs do not exist. Whether moss or other decomposed vegetable matter, it is acted upon by alkaline waters, taken up in the flood season, and deposited in the dry, in flat sheets highly impregnated with soda and other alkalies. It will not answer for anything but the coarsest and poorest quality of wrapping paper.

L. C., Bulliona, Alpine County.—Your communication on the taxation of mining claims will receive attention. Our stock of Mr. Raymond's blanks is exhausted.

Oregon State Fair.—Fifteen thousand people are reported to have been present at one time at the Oregon State Fair, which is just over, at Salem. The entrees of domestic manufactures and machinery were large, but of flowers and fruit double the preceding two, and of articles under the head of "Ladies' Department" equal in number to all other classes put together; from which it may be concluded that ladies are not quite so scarce as they are in the sage brush, and that Oregon is ahead in the matter of homes, schools, growth of towns and villages, and in the laying, broad and promisingly, the foundations of a great State.

Grape Growing as a Business.—Farming in Napa valley has been found less profitable during the two years past than previously. Grape growing is now considered the best paying branch of agriculture in that vicinity, the grapes being bought up to be manufactured into brandy. There are several brandy distilleries within convenient reach, doing a prosperous business. Grapes are worth $25 a ton, and will produce at from five to seven tons per acre. Vineyards five years old can at present be bought in Napa valley for about $300 per acre. Wheat is worth the same amount per ton as grapes, but grows only a fifth of the number of tons per acre.

Metallurgy in Northwestern Mexico.

Mr. Kustel's wet process, introduced by Ottocar Hoffman a year ago at the La Dura and Trinidad mines, Sonora, is working so successfully that many of the neighboring mines which were formerly abandoned are again worked, the ores being brought from them to the La Dura's reduction establishment for treatment. A single modification has been made in the chemistry of the process, arising from the situation of the mines. Sulphuric acid, and manganese, for generation of chlorine gas, were found scarce, or costly, the freight on a single carboy of acid from San Francisco to Guaymas being $6; and the loss and additional cost, by reason of breakage or other damage, in packing them into the mountains being still greater, Mr. Hoffman has found, upon trial, that he can work very successfully without chlorination, or to within 9 per cent. of the same results by the Kiss process alone, as heretofore described in the Mining and Scientific Press. The Kiss process is kin to the Patera process, having been suggested by it, and was first brought into practical use by the Hungarian metallurgist of that name. Patera roasted to chloride, extracted with hyposulphite of soda, and precipitated with sulphide of sodium; Kiss found that lime would answer the same purpose quite as well—extracted with hyposulphite of lime, and precipitated with the sulphide. The cost of working in this manner is insignificant.

Mr. Kustel, to whom the successful application of this process in Mexico is chiefly due, sails to-day for Guaymas, near which place he will superintend like metallurgical operations, that promise favorably.

Wet extraction is no experiment, and is not a "new process," though the modifications practiced by Mr. Kustel are original. Amalgamation, it must be understood, is not practiced, and is not necessary in this case at all. The ore is fahl-ore chiefly, containing only silver.

Cutter-Head for Planers—Patented October 12th, by Jefferson Kindleberger and W. Augustus Arnold, San Francisco. The cutting bits of our wood-planing machines are subjected to a great strain as they perform their work, and it is necessary that their fastenings should be secured with great care, in order to prevent frightful accidents. Messrs. Kindleberger and Arnold, amongst other valuable inventions, have originated what seems to us a perfectly secure manner of arranging the bits in the cutter-head so that they may be permanently fixed when desired, and quickly and easily adjusted when necessary. It consists in making slots through the cylinder opposite to each other and on both sides of the center. The pits or planes are inserted in these slots, and are held in place by a wedge-shaped metal plate, which is operated by a set-screw conveniently located, by turning which, the planes can be either secured firmly in place or freed from their fastenings. We look upon this invention as a decided improvement over the old manner of confining the planing bits.

An event, but a surprise, was the early rain of this week, the first after the long dry season on the coast. Capt. Cunningham, of the steamer Chin du Wan, just arrived from the upper Sacramento, reports that 1,000 tons of grain on the banks of the river, between Knight's Landing and Colusa, were exposed. The same steamers, with the barges, Swallow, Farmer and Union, have returned in order to relieve as far as possible farmers whose property is in danger of being ruined.

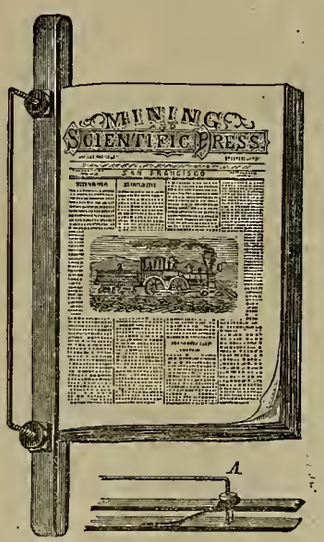
Assistant Librarian.—Mr. George B. Coleman, until recently in charge of the art gallery of the Mechanics' Institute Fair, has been appointed Assistant Librarian in the institution on Post street, vice Stoddard, resigned. Mr. Stoddard goes into the insurance business.

Burgess' Patent Newspaper File-Holder.

In the list of patents issued for the week ending October 12th, is one to Hubert Burgess, for the invention of an improved file-holder for newspapers and folio for sheet music.

Our engraver has made a fine illustration of the newspaper file-holder, given herewith, which is represented as partly filled with sheets. The instrument is light and handy, and holds the paper more firmly in place than other holders, and yet there are none in which the sheets are more readily adjusted.

The construction of the holder is as simple as its operation. It comprises two strips of wood or parallel bars. Through



the uppermost one pass portions of the bent rod. Flat springs are fastened to the lower bar near each end, which raise the upper bar as the nuts on the rod are turned when opening the bars for the reception of papers. Points are set near the front edge in the lower bar, at the right of the screw portion of the bent rod, upon which the sheets are placed and held in regular line until the upper bar is clamped down upon them by the pressure of the nuts, when run down on the threaded portions of the rod. These points may be seen in the fractional view of the holder marked A.

In all file holders before presented to the public, the papers are very liable to tear, or else the method of inserting them requires too much trouble, so that the wants of the public in this line have never before been met with satisfaction.

In Mr. Burgess' device, he provides a perfect holder, which may be quickly adjusted by a child even, and yet it is cheap and simple in construction, and we are compelled to look upon it as one of our best California inventions.

The patent of Mr. Burgess also covers the same device (with some additions and modifications) for forming a music folio. The parallel bars, or clamps, hold the sheet music in the leaves of the cover. A key of four or five inches in length is inserted in a slot cut in the back edges of the clamping bars, crossing the back of the folio, holding it stiffly open, so that it has no tendency to close, but will stand upon the music rack, and keep its place without annoyance to the operator.

This latter device needs an engraving to illustrate it fully. Musicians who have seen it speak in the highest terms of its value, and numbers have proved their faith by ordering samples at extra cost.

Mr. James Stratton, of Oakland, has been assigned one-half interest in this patent, to whom applications may be made for further information. Messrs. James A. Pritchard and J. D. Littlefield, of this city, are also interested in the right for this coast. Although a small article of manufacture, we deem this invention fully worthy of the extended mention we have here given it. This patent was first applied for through Munn & Co., of the *Scientific American*, but was finally secured through the agency of Dewey & Co., of the M. & S. Press. The patentees will explain the reasons for placing the case in our hands to the satisfaction of any Pacific Coast inventor.

Costly Mechanical, Industrial and Scientific Books.

The Mechanics' Institute is living up to the significance of its name by providing for its members all the important new works published in the East and in Europe of a practical nature, bearing upon the peculiar arts and industries of this coast. This is as it should be. Compel every intelligent mechanic, manufacturer, miner or civil engineer, to become a member, because he cannot *afford* to remain otherwise. The library has recently acquired, by purchase, some of the most valuable modern French works on architecture and general art, such as "Revue Générale des Travaux Publics," "Histoire de l'Architecture du Vme au XVIIme, Siècle," "L'Art pour Tous," "Monographie du Palais de Fontainebleau," "Edifices de Rome Moderne," and "Monographic des Halles Centrales de Paris." The plates in these volumes, executed in the finest style, are all working drawings, with plans, sections, scales and elevations.

As everybody in the country is interested more or less in mines and mining, the Mechanics' Institute is doing well in trying to keep up to the times on that subject especially.

Four Centuries Ago.

The Columbus celebration last Sunday, furnished a rather pleasing procession, in which a small three-masted lateen-rigged vessel, called the "Santa Maria," represented Columbus' caraval of that name, and a man in the proper costume represented the hero of just four centuries ago. The Italian militia and citizens at the City Gardens, in the afternoon, transformed that scene of delightful concerts into a temporary Italy—men, maidens, children, songs, and all. Columbus and the Norsemen both crossed the ocean, in what we would call the smallest kind of fishing craft. What could be more suggestive to a student on these coasts than the quadra-centennial celebration of Columbus' fancy, carried out in his little trip.

"Out into the ocean where the sun went down."

Safety Governor.—A new and excellent thing in the shape of an engine governor has been placed on the large engine of Booth & Co. in the Fair, by Wilkie Darling, the agent of the inventor. This is "Robertson's Automatic Safety Stopping Governor." Any of the ordinary governors, on the slipping of a belt, or the sudden stopping of the machinery from any other cause, would fail to shut off the steam instantaneously, and would leave the engine to run at such highly accelerated speed, as would endanger everything in the vicinity. This shuts off steam with great certainty, instantaneously. By means of a compensating weight which rises in proportion to the elevation of the balls, the steam is regulated as is done by other governors. Without attempting more fully to describe Robertson's governor, we refer engineers to the Fair engine, or to the *Bulletin* office, the Fulton Foundry, the Sacramento Iron Works, or the Ophir Works, Virginia City, where the invention itself may be seen in operation.

Sovereigns of England.—A most convenient little wall chart for reference under this title, has been presented to us by Mr. R. Varney, the author, giving the reigns of British sovereigns from Henry VIII. down to Victoria, with the prominent events occurring under each. It should be hung up in every reader and students' room. Francis & Valentine are the publishers.

The Fair will wind up on Saturday next. Next week the charitable institutions of the city will receive their usual series of benefits. Arrangements are being made for the grand closing ball.

Hallidie's Improved Suspension Bridge.

We give to-day diagrams illustrating the improved enspension hridge invented nnd patented by Mr. A. S. Hnllidie, President of the Mechanice' Institute. The bridge in the Pavilion connecting the two gallerics, and which forms a very importnnt feature in the present Exhibition, is constructed nlmost precisely in accordance with the dingrnms herewith given, by Mosers. Hallidie & Co.

Suspension bridgee, as nsually constructed, are sustained by a singlo cahle npon either side of the roadway, cach end of which passes over the top of the towers, nnd thence to the anchorago heyond. In the nnnexed diagrnme, illnstrating Mr. Hallidie'e invention, *two* cnhlee aro shown npon each side, one of which, starting from its anchorage, passes over the top of the nearest tower, and thence to the foot of the opposite one, throngh its hase, nnd following the dotted lines shown in figure 1, to the anchorage heyond. The other is arranged *vice versa*.

Again, in the old bridges, the snspending rods nro all perpendicular from the single cables upon a side, to tbe roadway; wbile in the diagrams herewith shown, the rods nre attached nlternately to the upper nnd lower cahles; while each nlternate rod is connected by diverging truss rods, passing diagonnlly from the lower to the npper cables. The first euspending rod to the right of A, in fig. 1, is attached to the npper cahlo, the next euspending rod to the lower cable, nnd the third to the npper, and so on till the point C is reached, nt which tho euspending rod is attached to both cables. At the lower cnd of each of these enspending rods are secured, by means of adjuetahle nuts or keys, etepe which receive nnd snetain lateral girders. Resting on and secured to the lateral girders nt a point half way between the steps, nre transverse girders, on which the roadway is built in the usual manner. The transverec girdere, being situated half way between the points of support, trnnsmit the load equally to the upper and lower cnhles. The converging or truss rods, already alluded to, connect cnbles A and B together in the manner shown in Fig. 1, nnd in snch a manner as to allow necessary change of deflection of curve from expansion or coutrnction of the cahles, without affecting rigidity of strnctnre or limit of equilibrium of parts.

Various contrivancee have been invented and applied, from time to time, to overcome the flexibility of the cables and roadway of suspeneion bridges, and to negative or prevent that undulating motion so dangeroue to the etability of the etructure and so detrimental to the traffic over it.

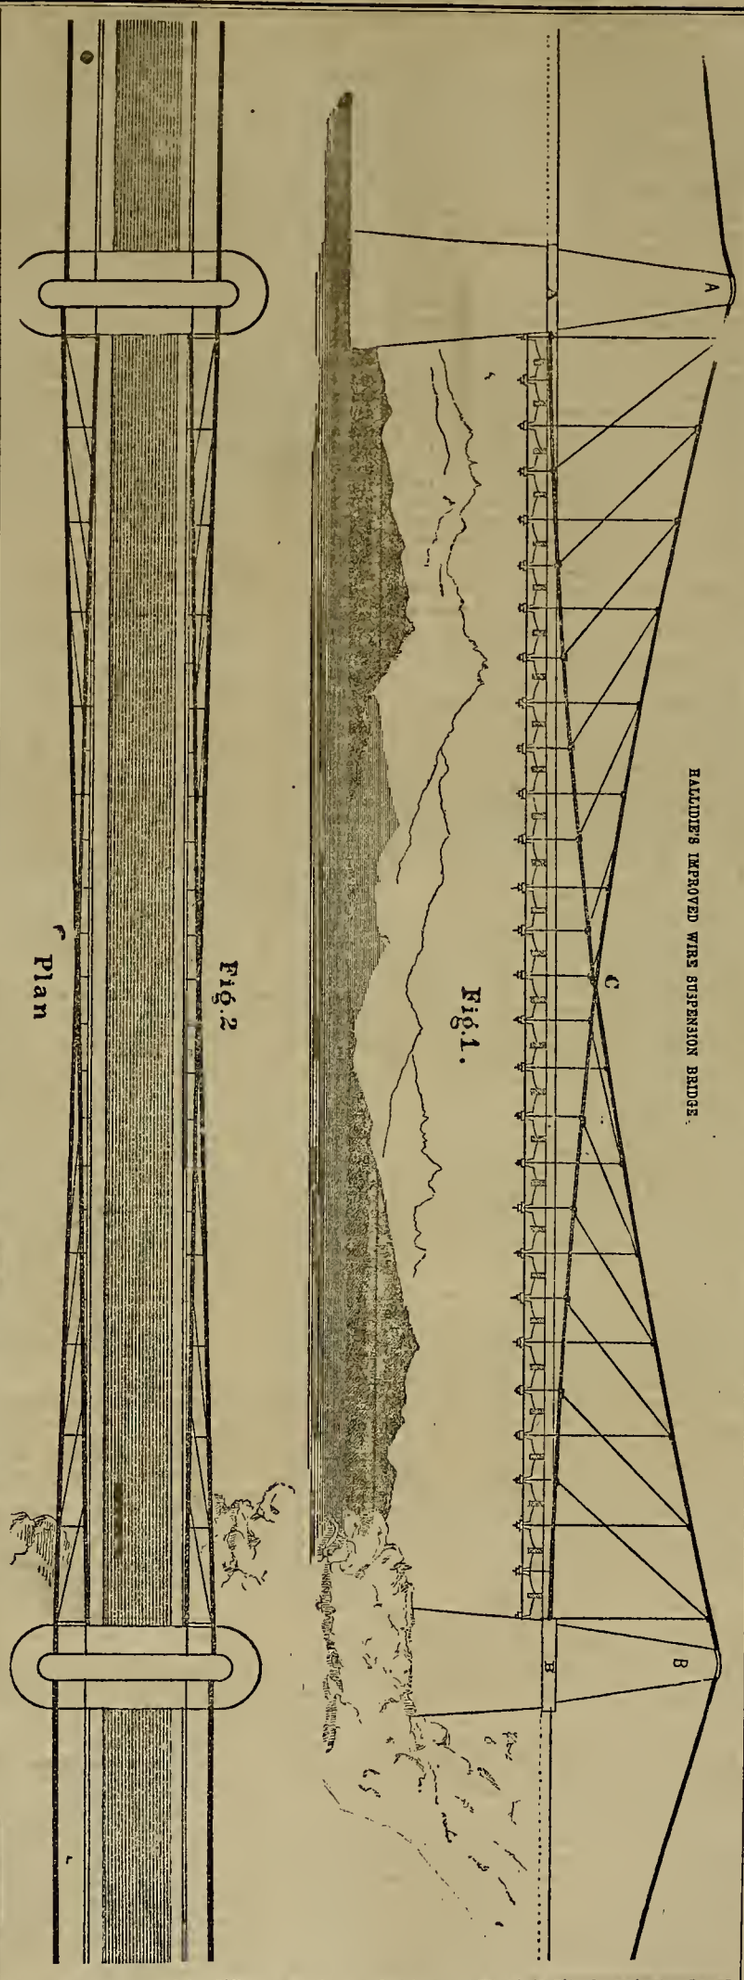
It is by means of these converging rods, in connection with the arrangement of two cables, together with the lateral girders, that the inventor secures n bridge as perfectly rigid as it is possible to make a euspension bridge, nnd a bridge in every way adapted for long spans and railroad travel, combining simplicity of construction with economy of material.

Fig. 2 ehows the plan of hridgo with method of arranging cahles to prevent side oscillation; the cnbles heing more dietant from each other at eummit of tower than nt the hase. and somewhat similar in principle to the plan adopted at the Cincinnati bridge.

Referring to general view of hridgo, it will he seen that a wave passing over the cablee must become negntived on reaching the point of intersection; nnd that the effect of a wave passing any particular suspending rod ie to raise the rod and one end of tho two lateral girders resting thereon to the extent of height of wave—the two transverse girders, on which the roadway ie huilt. being raised to the extent of only one-half the height of wave, thus reducing it to its minimum effect.

This improvement has received the highest commendations from many distinguished engineers, and among others, Mr. Roebling, who erected the Niagara and Cincinnati bridgee, and who, just before his death, planned the greatest engineering work of thie kind, which is to span the East River, between New York and Brooklyn.

A. S. Hallidie & Co. commenced huilding suspension hridges in 1854, since which time they have put up the Folsom bridge, 330 feet span; that at Nevada City, 320 feet; Klamath River bridge, 312 feet; Bear River hridge, 225 feet; Frazer River bridge, 292 feet; besides various smaller structures nt Mormon Island, and other places; also in Oregon and Idaho Territory. They are now engaged in erecting a hridge near Placerville in this State. They have also constructed in different sections, aqneducts for mining and water companies—spanning as high as 420 feet.



Wire Rope.

They are nlso manufacturing large quantities of flat iron rope, which is coming into favor with mining companies. The Ophir Co. at Virginia City, have just ordered two flat wire ropes five inches wide, three-eighths thick, and 1,500 feet long. The demand for wire rope for mining purposes is increasing.

There is also an increasing demand for rope for rigging for ships. Most of the emall craft huilt here adopt iron rigging to n greater or less extent. In snch rigging, made of galvanized wire, one ponnd of iron is equivalent to one nnd three-qnarters pounds of hemp; while the cost of the first ie 14 cents per pound, against 17 for the latter. Another important matter, in connection with the employment of wire rope for shipping, is the fact that the area of enrface which it presents to the wind is as one to two and a quarter, when compared to hemp. Iron rigging does not have to be "set np" (tightened) after variations of weather, as is necessary with hemp. Iron rope may he spliced and fitted in all kinds of weather, quicker, neater and better than that made from hemp. As the expense of rigging n ship forms an important item in its cost, the fact that the eame can he done cheaper with iron than with hemp, ehould be made an important consideration.

At a recent exhibition of the Institnte, Mr. Hallidie exhibited an ingenious mnchine for making wire rope, upon which he had made important improvements. In the present Fair, he exhibits another important invention of his own, in addition to the hridge, which he calls a "grip pnlley," designed for conveying power by means of ropes, wire or hemp. This invention, which eupplies an important want in this direction, was fnlly described in our columns n ehort time since. Application for a patent for this inventon has heen made through the M. & S. Press Patent Agency.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreion Patent Agents, and Publishers of the Mining and Scientific Press.]

For the Week Ending October 12th.

Newspaper File and Music Folio.—Hubert Burgess, Oakland, Cal. Assignor to self and Jamee Stratton.

Gang Plow.—Gustavus A. Davison, San Leandro, Cal.

Steam Engine.—W. H. T. Clark, Snn Francisco.

Cutter-Head for Planers.—Jeffereon Kindleberger and William Augustus Arnold, San Francisco. Assignors to the Inventors' Association of San Francisco.

Blind Wiring Machine.—Jefferson Kindleherger and W. Augustus Arnold, Snn Francisco. Assignors to the Inventors' Associntion of San Francisco.

Earthquake-Proof Chimney.—B. F. Mann, Oakland, Cal.

Key Guard.—Braddock R. Hathaway, Mormon Island, Cal.

Anchor.—George A. Lloyd and Charles A. Stewart, San Francisco.

Machine for Grinding Harvester-Cutters.—John Weichhart, San Francisco.

Heating Apparatus.—John Armstrong, Jr., Sau Francisco.

Rotary Harrow.—Henry A. Gaston, Stockton, Cal.

Combined Seeder and Grain Drill.—Henry A. Gaston, Stockton, Cal.

Spark-Arrester.—Isaac H. Graves, Sacramento City, Cal.

Medicine for Rheumatism.—George Conroy, Mendocino County, Cal., assignor to Robert A. Smith, same place.

In Australia.—It was stated in our last issue that Capt. W. C. Paul, the co-inventor of the Richard & Paul elum and float gold amalgamator, was acting as the London agent, which ie an error. Mr. John A. Ilbury is the agent, and Capt. Paul, who was until recently the snperintendent of the Chontales G. & S. M. Co., presided over by Earl Nelson, is now in Australia, introduc the new system of working into the min ing districts of that country.

Popular, Prosperous and Deserving. The Firemen'e Fund Insurance Company, incorporated some years ago, becnme a popular institution from the start, and hns nlways maintained a credit in San Francisco and throughout the coast, second to no other company. Its business has been managed quietly and judiciously, and we have no hesitation in recommending it unreservedly to persons who desire to take out policies for firo or marine riske. Its officers are: D. G. Staples, President; Henry Dutton, Vice President; and Chas. R. Bond, Secretary. Its business ie conducted in their substantial building corner of California and Sansome streets.

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

[From the Mechanic' Fair Daily Press, Oct. 16.]

The Fun of the Fair appears to he centered ahont the blowing machine, where the boys of small, as well as those of larger growth, nightly hold hilarious carnival. The machine blows a perfect hnrricane throngh a moveable tnbe about five inchee in diameter, and whatever comes within range of this "invisible power" has got to "get np and git." The fnn consists in watching nnsuspecting parties come within reach of the wind—when off go the hats, bonnets, capes, or whatever is loose. Last night the sport was made extremely rich by a conple who afforded an exhibition which was not entered on the bills. The gentleman was tall, military looking, with whiskers and hair of jetty hne, and curled to the very highest perfection of the tonsorial art. The lady was fair, fat and say twenty-seven, ehort, and wore an enormonsly large blonde chignon, npon which wae a very diminntive hat. When thie couple came within reach of the blast, they were talking and emiling at each, particnlarly gracefnl, when—Presto! in the twinkling of the eye, off went the man's hat, wig and whiskers, leaving his head as bare of hair as a haby's, and—horrors! The little hat of the lady carried off her large chignon, exposing a rather carelessly arranged "brick top" The laugh that followed did not enhside for nearly an honr.

A Simple Washing Machine.—Mr. Lewis exhibits a very simple and apparently a very efficient washing machine, which consists of a common wash tub, having a corngated bottom, with the alternate ridges and depressions radiating from the center, upon which the clothee are placed; a disk, with its nnder side similarly corrugated, is then placed npon the clothes and forced down with a moderate pressnre by means of a lever. The outer end of the lever is then gently pushed back and forth, through an arc of ten or twelve degrees, by means of which a succession of pressures or sqneezes is given to the clothes, which rapidly removes the dirt, without auy pounding or undue wearing. It is in fact, a double rotary wash-hoard, between the faces of which the clothes are pressed rather then rnbbed. It is said to have taken the first premium at every fair at which it has been exhibited. Accompanying this machine, is an improved wringer, which can be readily converted into a mangle for ironing without heat. Agency for the Pacific coast, at 117 Geary street.

Jones and his friend Kane, the well-known dry goods man of Clay street, were going up to Stockton yesterday, and were a little late in starting. Kane becoming impatient lest they ehould lose the boat, wanted to call a hack. Jones implored him not to be in a hnrry—for only think what he would he if he were a hurry Kane. Kane qnieted down at once.

Saved his Bacon.—A young gentleman of this city, named Ham, about to marry Miss Nellie Bacon, of Howard street, took her to Bradley & Rulofson's photographic gallery to have her picture taken—in order to save his Bacon, becanse shc would not be Bacon when she became Ham.

Coffee Grounds.—Florida hoasts of having seven million acres of land adapted for growing coffee. California has consideranle eoffee grounds, but not so much as is generally snpposed, owing to the quantity of chicory used.

A Bluff Game.—The people of Baraboo, Wisconsin, report the discovery of gold in large quantities in some bluffs in that vicinity. We are afraid of "bluffs," in gold mining; we have had too many of them here already.

If Langley puhlishes in his directory the whole of the Owiugs in San Francisco at this time, the list will be longer than that of the Smiths, Joneses, or Robertsons.

What is the difference betwoen a boiled carrot and a San Francisco policeman? The first cau't break a citizen's head withou heing broke—the latter can.

Young Soldiers.—The St. Augnstine College Cadets, from Benicia, visited the Pavilion this afternooo. They numhered ahout 60, wearing handsome gray uniforms.

An Eoglish prize-fighter, named King, has turned preacher. The people say he is a first rate ex-pounder.

Ireland may be famous for making bulls, but it never raised such au ox as is now o1 exhibition at the Fair.

[From the Mechanic' Fair Daily Press, Oct. 18.]

The Excelsior Pump has filled a prominent position in the principal fairs in this State for the last five years, taking many premiums and steadily increasing in favor throughout the coast. It is one of our best California inventions. Captain Cnshing, the proprietor, informe us that his sales last year amonnted to an increase of 50 per cent. over former seasons. They have always been manufactured in first-class style, at the Union Foundry. Their thorongh constrnction, and the liberal dealing of the proprietor, are two good reasons why the pump has heen so successful; sending out an article that will work well nnder all circumstances and last well, has increased the trade. Following up this advantage, the proprietor is now adopting an improved packing, which has lately come into great favor in Europe. It is more costly than packing commonly nsed, bnt the Captain intronduces it into his pnmp without any increase of price to his cnstomers. The Excelsior pump on exhihition in the Pavilion has been purchased by W. C. Ralston, for his fine residence at Belmont.

Billiards Extraordinary. — Messrs. Deery & Little, whose billiard feats will interest and astonish our visitors this evening, are advertised to play again on Wednesday and Friday, afternoon and evening. The genteel billiardists of the Pacific, who will all be present, of conrse, will have a fine opportunity to study position, style and effect, from the gallery, which affords all the enchantment of distance that cau be desired. The Fair Press doffs its forehead out of regard for the professors of force and resistance, and of palpable geometry, at the same time affording unohstructed vision to friends of practical science in the gallery.

Marnen & Myrick.—The coffee and spice works of these gentlemen, at 212 Sacramento street, were recently burned out, but the good name and fame of the goods the proprietors have invariahly furnished our citizens for many years, was too great to allow them to suspend operations, and we hear, almost immediately, that they are going on as usual. Persons who have not patronized them (if there are any such honse keepers in the city) should lose no time in trying their popular brands of coffee.

A Worn of Advice to Young Men.—If you have a sister, take good care of her. If you have not, then get some other fellow's sister to take care of. The taking care of somebody's sister has a very soothing effect on the masculine nervous system.

A Doubting Spirit.—A lady whoee deceased husband had not enjoyed a continuous flow of felicity dnring life, was asked at a seance one night if she would like a communication from his spirit. "I believe not," she said. "If he's got no more spirit in the other world than he's had in this, it's not worth hothering about."

Numbered.—The pictures in the Art Gallery have been numbered from 1 to 361, corresponding with the catalogue published in the Fair Press. This is a good thing; and those who have preserved copies of the catalogue can refer to the title of each picture exhibited.

Why is the Fair Press like a sewing machine? Because it sews, fells, puffs and gathers. It sows broadcast the gems of wit and science, fells empty conceit, puffs deserving merit, and gathers all that is good in the Fair.

Shocking.—Jones fancied he felt the shock of an earthquake yesterday, aud asked his landlady whether she felt it; she said she felt no trnly shock, hut was shocked to hear him talk about shocks.

Two lovers conrted Miss Gruhh. Oue named Garrett was snccessful. The other left the country because he detested a garret, and couldu't live without grub.

W. A. Sublett's Winnow Catch is one of the novel California inventions of merit oo exhibition near the blowing machines. It works to a charm.

Jones says the mud in the streets of San Francisco is like slanders, becanse it dirties the best nnderstandings, and is very hard to rnb off.

Never tnrn a blessing round to see if it has a dar k side to it.

[From the Mechanics' Fair Daily Press, Oct. 19.]

Craig's Dump Wagon.—On a table in the machinery department, and near the *big gate*, may he seeu a working model of an improved dump wagon, the invention of Mr. John Craig, of this city. The construction is such that by allowing the hottom of the wagon to open, the load is at once discharged, and the hottom, which is composed of two parts, may be closed. The two parts of the hottom are hinged to longitudinal rails at such a poiut, that when loaded, they will be supported so as to require very little assistance from the levers, to discharge it. The levers extend up in front of the wagon, and are susceptible of considerahle modification of form for various uses. They are intended to work together, and each operates on a shaft which extends beneath the wagon, and carries arms by which, when the shaft is turned, the bottom pieces are lifted. The inveutor, who is exhibiting the modol, will be pleased to give any further information, either at the Fair, or at his carriage manufactory, 255 Folsom street, where they can he furnished as may he desired by contractors. Patented through the M. & S. Press Agency.

Blake's Steam Pump is nndoubtedly a most excellent pump. The small one in operation in the Pavilion has attracted the general attention of mechanics sioce the opening of the Fair, although but little or no attention is required by it. The agents of the manufacturers, Berry & Place, probahly think it is capable of "going alone." Somebody turns the steam on usually, and the pump starts, and we notice that it continues to run nntil the steam is shut off again. Sometimes a gentleman, wishing to test its capacities, shuts off the steam in part, and it will rnn slower; then it is shut almost entirely off, and it just creeps along. Then if let on again, off it goes at good speed, throwing a good stream; but so long as it has any steam, so long it keeps to work. This, we helieve, is what is called being "positive" in a pump, (i. e., having no dead points, but "passing the center," and starting at *any* point and going *sure* every time), and we shonld judge it to be a valuahle point in a steam pump.

McLeon's Patent Lock.—This improved door lock can be seen on the table near the display of pumps io the Pavilion. The invention is more especially applicahle to spring locks or night latches, and consists in part in so constrncting the tumbler that when moved by the key in one direction it so acts on a secondary bar as to securely stop the bolt, and when moved in the opposite direction it relieves the bolt so that it can be operated by the knob, and will serve as an ordinary latch. It requires personal examination to illustrate its superiority of constrnction and its various merits. It was patented by John McLeod, a young inventor of this city, and was patented through the M. & S. Press Agency, April 13th, 1869.

An Interesting Rehearsal.—The driver of a hearse, returning from a fnneral at Lone Mountain, on Sunday evening, saw a drunken man lying on the road side. To save the man from being run over, he was placed in the hesrse, and carried to the police station. The bad whisky he had drank, caused him to drop into that sleep which knows no waking, and he was rehearsed yesterday. This is rather a grave joke, hut is a very interesting case of rehearsal.

The Last Stocking.—A bachelor at a social party ventnred to say, that every lady present at the party took off her left stocking last before going to hed. The statement created a seosation, and the gentleman was ordered to explain. He said: "which ever stocking a lady takes off *first*, the other is necessary *left*, which must of course he taken off last."

Sich is Life.—Reddy the Blacksmith, who was a "caged lion" while here recently, and was taken back hy the nyrmidons of the law, to account for a little garroting affair in New York, has been tried, *honorably* acquitted, aod is now the favorite candidate for Congress in the Empire City. Such is life iu New York. In jail to-day, in Congress to-morrow.

An Amusing Typographical Error.—One of the recent agricultural fairs offered a premium for the best mode of "irrigation;" but the printer made it "irritation," and the error was not discovered till a farmer in San Joaqnin County demanded the prize by presenting his wife, whom, he said, could irritate any liviog thing.

[From the Mechanics' Fair Daily Press, Oct. 20.]

Flies baked into cake, or stewed, or boiled into soup, are not so rare as to "nonplnsh" even a fastidious eater, nowa-days, but they are not pleasant to meet with as fossils. We can recognize flies as objects that do not belong to seasoning. But there is, besides, mnch nnrecognizable dirt that finds its way into cooking ntensils, milk pans, and the like. Mr. George Renben, of this city, briuge inventive genius to the rescue, in making wire gauze coverings, or lids, which are especially handy for potato hoiling utensils, for milk cans, but are adapted to a wide general use in the kitchen and dairy. When milk cans are left standing, the lid is always lifted off to admit air and prevent spoiling. With Mr. Reuben's gauze, the necessity for an ordinary cover eveu during transportation, is obviated, since milk will not spill through the gauze; and milk having the benefit of air can be made to keep much longer. The cost is inconsiderahle. Samples of Mr. Reuben's patent can be seen in the mechanical department.

Scroll Saw.—Near tho lower end of the machinery department, may be seen a scroll saw, the invention of T. Stebins, of this city. It presents some very nseful novelties, one of which is the use of three straioing springs, which are so arranged that any number of these may be employed as the work is light or heavy and the saws small or large. The guide blocks are so arranged that when very light saws are to be used, they may be clamped in place instead of weakening them by making holes through which to pass pins. By placing the guides at an angle, the rake of the saw at the top and bottom is the same, and the saw may be kept perfectly vertical in its movements, which is of great importance in sawing deep work. The table turns abont centers, which are in a line with the npper surface, eo that a comparatively narrow space serves for the passage of the saw whatever the inclination of the table. The saw is perfectly nnder the control of the operator, and Mr. S. has turned out some remarkable specimens of scroll sawing.

A New Use for the Microscope.—We are informed that a learned *Savan* has discovered a way of telling the honesty of individuals by examining the hair from the top of their heads with a microscope. It was intended to have examined some from the candidates for the Supreme Court, to be voted for to-day; bnt they are all baldheaded, eo the experiment could not be made.

Earthquake Anniversary.—To-morrow, Oct. 21st, is the first anniversary of the great earthquake. We trust it may pass off quietly. Perhaps, however, we ought to beg W. Frank Stewart's pardon for this wish; for he has requested us to "expect—earthquakes—about—this—time."

Tom Thumb had a costly mansion bnilding opposite his Father Warren's house in Middlehorough, Mass., bnt the gale of the 8th instant scattered the bnilding far and wide, and blew the cellar over into the next lot.

Jones says the woman he is looking after to make Mrs. J., must have little waste, great bustle, and good nnderstanding. Ho says the modern style of dress affords excellent opportuuities for marking these traits of the ladies who attend the Fair.

What a Delicious Name!—One of the prettiest girls in a dollar store, on Kearny street, is named Flora Kissagin. It would be a pity to spoil such a name by getting married.

Are you hnogry? Are yon thirsty? Are you hot? Are yon cold? If so, patronize Schiller & Schmidt, in the Fair Restaurant. The fare is good and reasonable.

A Curious Sight to ne Seen on Telegraph Hill.—A bird flying with a dog sitting on its tail. This curions phenomena may be seen at almost any hour of the day.

A Boston chemist advertises thns: "The gentleman who left *his* stomach for analysis will please call and get it, together with the results." Not had for the "Hnb."

A Mr. William Day was recently knighted by Queen Victoria. It will be all night with that Day hereafter.

Why was Pharoah's daughter like a broker? Because she got a little prophet from rushes on the banks.

Spain has over ninety bull rings, There are ahout that number in Wall street also.

[From the Mechanics' Fair Daily Press, Oct. 21.]

A Challenge.

There have been a less number of competitory trials of machinery in the Fair this season than heretofore, for some reason or other. We would like to see a little more pleasant and fair rivalry manifested on the part of exhibitors. If an inventor is running an inferior machine to his neighbor's, the sooner he finds it out the better for himself and all concerned. If he has a better article, the public have an interest in knowing it. We presume it is in this spirit that our well-known friend, John M. Horner, of Mission of San José, sends out through our advertising columns the first public challenge we have noticed this season—broadly inviting all inventors in that line to contest their machines with his "Economy" Washing Machine. The "Economy" has long held an excellent name and perhaps cannot be beat yet, but we should like to see it have another trial now with its new competitors. Mr. Horner is the inventor of a very successful harvester, which cuts, throshes and cleans the grain in the field at one operation. For our next Exhibition we call upon him to bring forward one of his full-size harvesters.

Homeopathy.—The practice of homeopathy has had a wonderful growth in the United States, and is still increasing in favor with cautious people, who do a deal of their own thinking, and are inclined to take care of themselves in good season, when beset with the ills of life to which all flesh is heir. Yet, with the utmost precaution, we are all liable to need a physician some time, and to such as are not already informed of a good reliable practioner in this city, we shall recommend (from personal acquaintance) John H. Floto, M. D. He was reared and educated in Europe, has had 20 years constant practice in Salem, Mass., and now stands second to no homeopathist in this city.

A Little too Familiar.—A good joke is told of a smart Chicago youth who went down to Arkansas on business. While there he went to a party, and at the party danced with one of the settlers' wives. The settler stood it as long as he could, but finally becoming enraged, he went up to the youth and says: "Look here, mister, that is my wife you are dancing with." "Well, what of it?" said he. "Why, this: you dance with her again, you speak to her, you even look at her again, and I'll blow the top of your head off!" "Now, look here," said the juvenile, coolly, "do you see that umbrella setting thar?" "Well, s'pose I do?" "Well, you handle that umbrella, you touch that umbrella, and I'll ram it down your throat, and *I'll spread it!*" This settled the settler.

A Strong Recommendation.—A young woman in one of the rural towns of New Hampshire was desirous of teaching school in a neighboring village, and got this document from the selectman: "This is to certify that Tamar Noyes stands on a medium with other girls of her age and sex, and for what I know is as good as folks in general." Tamar got the school.

An Irishman, with a heavy bundle on his shoulder, riding on the front of a horse car, was asked why he did not set his bundle on the platform. He replied: "Be jabers, the horses have enough to drag me. I'll carry the bundle."

The Eugene City (Oregon) *Journal* expresses its gratification that the "skeleton man" and the "bearded woman" have bought land and are to locate in that city.

Hair is coming down in Paris. It is too high in San Francisco, most of it being worn on the top of the head.

Jones wants to know how it is that wheat continues falling and bread keeps rising in California?

Metallurgy.

MOSHEIMER'S
Pioneer Mining School
—AND—
METALLURGIC WORKS.
ESTABLISHED.....1858.
Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to work any kind of ore, or mineral substances.
Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.
I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.
For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

R. TAYLOR. WM. H. TAYLOR.
ROBERT TAYLOR & CO.,
METALLURGISTS.
SMELTING WORKS,

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this invaluable Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Horticultural Cocoa and Soluble Chocolate. Sleepy Mills, Brick Lane, London.
3v19-6m

[From the Mechanics' Fair Daily Press, Oct. 22.]

Silver Mining in Washoe's Early Times.

Mark Twain told the Pioneers his mining experiences in Esmeralda, which were exciting, but not lucky: "I finished," he says, "by feeding batteries in a qnartz mill, at $15 a week, and wishing I was a battery myself, and had somebody to feed me. My claims in Esmeralda are there yet. I suppose I could he persuaded to sell. I went to the Humboldt District when it was new. I became largely interested in the Alba Neuva, and other claims with gorgeous names, and was rich again—in prospect, I owned a vast mining property there. I would not have sold out for less than $400,000 at that time. But I will now. Finally I walked home—200 miles—partly for exercise, and partly because stage fare was expensive. Next I entered upon an affluent career in Virginia City, and hy a judicious investment of labor and the capital of friends became the owner of about all the worthless wildcat mines there were in that part of the country. Assessments did the business for me there. There were a hundred and seventeen assessments to one dividend, and the proportion of income to outlay was against me. My financial thermometer went down to 32 Fahrenheit, and the subscriher was frozen ont. I took up extensions on the main lead—extensions that reached to British America in one direction, and to the Isthmus of Panama in the other—and I verily helieve that I would have been a rich man if I had ever found those infernal extensions. But I didn't. I ran tunnels till I tapped the Arctic Ocean, and I sunk shafts till I hroke through the roof of perdition; hut those extensions turned up missing every time. I am willing to sell all that property and throw in the improvements."

The Race of Bachelors are so rapidly hecoming extinct in our society, says the *Social Voices* of the Young People's Social and Literary Society, of this city, that the fact is already alarming to the single young men who remain, for they feel their numbor is being reduced to so few, that they are made all the more conspicuous as they stand out like old landmarks, or the relics of some by-gone age, attracting the notice aud sympathy of the passers-by. We think, too, that it may be suggestive of the lack of moral courage on their hehalf. They dread the tryiug ordeal of first "popping the question," and then "asking papa." For fear that some such dread spectre may hauut these *young* men in their dreams hy night, and their thoughts by day, we give the following anecdote for their encouragement:

When Aytoun was making proposals for his first wife, a daughter of the celebrated Professor Wilson—the lady informed him that it would he necessaryto ask the approval of her sire. "Certainly," said Aytoun: "but I am little diffident in speaking to him on this subject; you must go and tell him my proposals yourself." The lady proceeded to the librrry, and taking her father affectionately hy the hand, mentioned that Professor Aytonn had asked her to become his wife. She added: "shall I accept his offer papa? He says he is too diffident to mention the suhject to you himself." "Then," said old Christopher, "I had better write my reply, and pin it on your back" He did so, and the lady returned to the drawing room. The anxions suitor read tho answer to his message, which was in these words,—"With the author's compliments."

Moral.—Go thou and do likewise.

Our counter show case contains a portable cabinet of 98 specimens of minerals from Europe and various States of the Union; British Letter Patent, with the great seal; one hair hall, five inches in diameter, taken from the stomach of an ox, in Amador County, Cal.; a four-pointed steel drill from the Hoosac Tunnel, Mass., same as used in the pneumatic drilling machines.

Morgan Gale exhibits in the same case, one shoeing hammer, highly finished and of superior design, mado by himself in Mexico, entirely by hand, in a blacksmith shop. Also one tuning fork.

Dr. L. G. Yates, of Centerville, Alameda Co., shows a cahinet of silurian, devonian and carboniferous fossils from New York and Pennsylvania.

Linforth, Kellogg & Rail, who exhibit the Gerrish Submerged Pump in the Pavilion, are doing a very thriving business in general hardware, at No. 5 Front street. They have already established a fine trade with Utah, and are proving an active, growing firm in all branches of their trade.

San Francisco Prices of Copper Ores.

San Francisco, Oct. 22, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

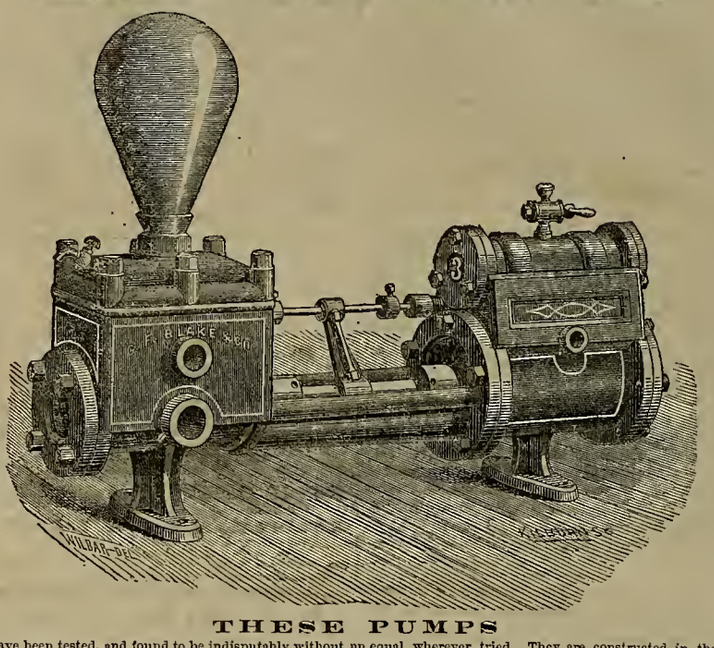
	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 60
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

These prices, corrected by W. T. Atwood, we helieve will be found substantially correct, and can be realized at this date.

No Objection to Greenbacks.—A thief walked into a money changer's office on Montgomery street yesterday, and under the pretext of purchasing an old 50 cent coin, managed to purloin nearly $200 worth of greenhacks, with which he escaped. That fellow don't mind taking greenbacks.

BLAKE'S PATENT STEAM PUMP.



THESE PUMPS

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—specially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

It is positive under any pressure. *May be run as slow or fast as may be desired.* Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility. Will start at any point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever.

The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes;

IN BREWERIES, TANNERIES, SUGAR HOUSES, FACTORIES, MILLS, LAUNDRIES,

And as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. Twelve different sizes are made, capable of throwing from 1,000 to 180,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,
112 and 114 California Street, San Francisco.

☞ Every pump will he warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. 17v19

GOLD METAL, OR COLLINS' METAL WATCHES.

IMPROVED OROIDES.

Great Reduction! Prices in Greenbacks!!

We have made great improvements in our Watches lately, and will hereafter sead only our BEST QUALITY, with Bill of Collection in Greenbacks.

Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

DEWEY & CO.,
No. 414 Clay street, S. F.

Hints to Inventors.

The assignee of every invention may have the patent issue to him directly, when he is the purchaser of the entire interest.

A patent may issue in the joint names of the inventor and assignee, the inventor himself being one of the assignees.

The application must be made by the actual inventor, if alive; but if the inventor be dead, it may be made by his heirs or executors.

A working model is always desirable to enable the office to determine its precise operation. The name of the inventor and also of the assignee, if assigned, must be fixed upon it in a permanent manner.

What is really embraced in the original invention, and so described or shown that it might have been embraced in the original patent, may be the subject of a reissue.

The mere fact of prior invention abroad will not prevent the granting of a patent, unless the invention had been described in some printed publication.

When the patent is applied for in the United States, after being obtained abroad, it will extend only fourteen years from the date of the foreign patent.

Every assignment should be recorded in the Patent Office within three months from its date.

All old materials and old principles are used in a state of combination to produce a new result, the inventor may obtain a valid patent for such result.

When an application has been rejected, the inventor may manufacture his invention for two years, with the privilege of renewing his application within that time, if he so desires.

The inventor or inventors must sign the petition and claims, the latter to be attested by two witnesses, also take the required oath before some authorized person.

A partner, who is not an inventor, cannot sign a joint application without committing perjury.

If the inventor fails to pay his last Government Fee within the time prescribed after the patent is allowed (six months), he may, at any time within two years, renew his application by paying the first fee again, and thus finally obtain his patent.

Models may be withdrawn from the Patent Office by inventors when their cases are rejected.

The actual manufacture, sale, or use of an *article* may infringe—but the sale or purchase of *patent rights* is not infringement.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

Small agents swarm about the Patent Office block at Washington, ready to receive the unwary applicant, who determines to go to Washington to prosecute his own claims. Ingeniously-worded and cunningly devised circulars, are showered upon every patentee when his claims are first published, and inventors are led to believe that in future their patents can be secured at very low rates. We have never heard of an inventor, here or in Washington, employing any of these promising letter-senders at anything less than exorbitant prices in the end, for services performed. A majority of the substantial offices in Washington are branch agencies of houses in other cities.

The published rules of the Patent Office say: "The Patent Office cannot respond to inquiries as to the novelty of an alleged invention, in advance of an application for a patent, nor to inquiries founded upon brief and imperfect descriptions propounded with a view of ascertaining whether such alleged improvements have been patented, and if so, to whom; nor can it act as an expounder of the patent law, nor as counselor for individuals." Such information should be sought through intelligent and reliable agents.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving at least several weeks time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, *with our other advantages*, to secure the *receipt* of patent papers to inventors on this Coast, several months sooner than can generally be done through agents in the East,—without the applicant going to the risk and expense of sending on the last fee before it is known whether the patent will be granted.

10v18 6m B. F. HOWLAND.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Use Pain Killer for Cholera and Bowel Complaints, for Boil, Cuts, Bruises and Scalds, Old Sores, Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat,**
Sneddn Colds,
Coughs, Etc.
Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to imitate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

A Family Medicine.—The PAIN KILLER is a purely vegetable compound, and while it is a most efficient remedy and pain, it is a perfectly safe medicine, even in the most unskillful hands. For Summer Complaints, or any other form of bowel disease in children or adults, it is an almost certain cure, and has, without doubt, been more successful in curing the various kinds of Cholera than any other known remedy, or the most skillful physician. In India, Africa and China, where this dreadful disease is more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a *sure cure*.

We have long known the high character of the PAIN KILLER, and that it is used with great success and satisfaction in our best families. It is the favorite medicine of our missionaries in heathen lands, where they use it more than all else together for the diseases that abound in those warm climates. It should be kept in every house, in readiness for sudden attacks of sickness.—*Chr. Press.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

KENDRICK & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents

New Mining Advertisements.

Siempre Viva Silver Mining Company, District of Zarugoza, Sinaloa, Mexico.

WALTHAM WATCHES.

Let every one who wants a Watch, read this carefully.

Especially if in some remote out-of-the-way place.

Now that the railroad is open, we propose to give the residents of CALIFORNIA the opportunity of getting single genuine Waltham Watches at the

Lowest New York Wholesale Prices.

We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it: and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or

REFUND THE MONEY.

As an indication of the Prices, we will quote one Watch from our list, The P. S. BARTLETT, *Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,*

$28 in Greenbacks, or about $20 in Coin;

All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,

HOWARD & CO.,
Jewelers and Silversmiths, 619 Broadway, New York.

We refer, by permission, to

STEEN & CUSHING,
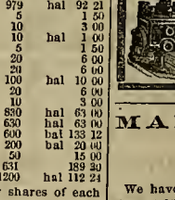
16v16 **No. 9 First street, San Francisco.**

Blake's Patent. THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's



Patent Steam PUMP

It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted perfect under all circumstances. Send for a circular.

BERRY & PLACE, 112 and 114 California st., San Francisco.

MANUFACTURING Room to Let.

We have a large room, about 18 by 36 feet, in second story at 414 Clay street, near Sansome, which we will rent very low, suitable for printing or manufacturing purposes

DEWEY & CO.,
Publishers Mining and Scientific Press, 414 Clay st

MAYFIELD, Cal., June 26, 1869.

DEWEY & CO., *Patent Solicitors, San Francisco*—Gentlemen:—In acknowledging the receipt of my Letters Patent, allow me to express my thanks for the skillful and trustworthy manner in which you have conducted my business before the Department at Washington. I am perfectly satisfied with the high degree of ability and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly, J. M. JOHNSON.

At the Minnesota State Fair, last year, a man appeared with a big squash, which he had brought 170 miles on an ox-cart, walking every step of the way. Of course such an extraordinary instance of devotion to the science of squash raising procured the husbandman a notice in the papers, This year there appeared not one, but seven ox-carts, all with squashes in them, all brought from a distance of over 150 miles, the respective owners all declared that they had walked every step of their respective journeys, and these were righteously treated by the press with the most awful silence.

All History is Unreliable.—A story is current and may be true, but by and by all the papers get hold of it and it becomes *their* story. Then some authoress works it up into a romance, and it becomes *her* story. Then some masculine writer reviews the lady's book, and it becomes *his* story—history—and cannot be depended upon for its truth.

A Wonderful Will.—The late Rufus Dwinel, of Bangor, Me., left $2,000 to the Editors of the Bangor *Whig*, as a mark of his appreciation of the services of the press. Such a bequest is without precedent, and will probably never be imitated.

Wheelbarrows have come down to us through six centuries, and have hardly experienced an improvement since the first invention.

The lawyer would be better off, his conscience far less pliant, who owned a little farm in fee, and made that farm his client.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.

On hand and for sale. Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v6tf

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness with the advice of a physician, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be so digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the physician only can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apirture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street,

1v1 San Francisco.

The Most Important Invention of the Day,

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

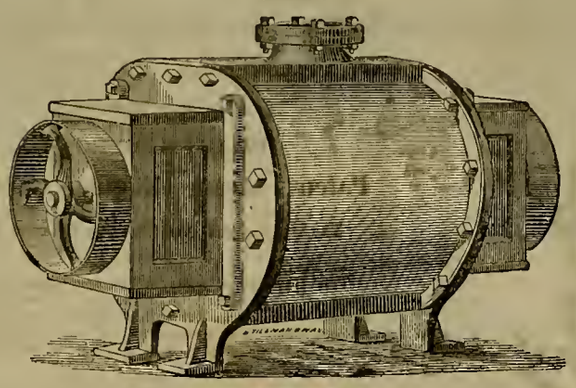
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 6, 1868.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cures them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by any body. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change these complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Orant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

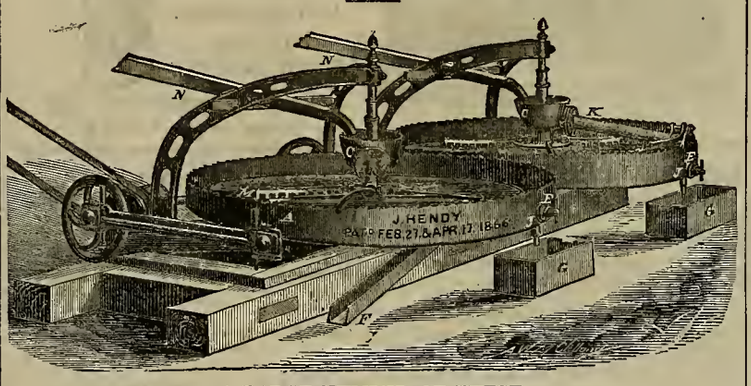
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

Mr. Hendy, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice. By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

Office of North Star Mine, Grass Valley, Nov. 12, 1868.

Joshua Hendy, Esq.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the rcconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, T. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Battersea Works, London.

THE MOROAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every not obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

18v18-9p 519 Front street, San Francisco

To the miner, farmer and mechanic—the three great interests that form the base and ground-work of all our prosperity—this paper should be considered as almost indispensable. We wish the Press boundless success in the future.—*Placer Herald*

MINING AND SCIENTIFIC PRESS.

A Journal of Useful Arts, Science, Mining, Farming, and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, OCTOBER 30, 1869. VOLUME XIX. Number 18.

New Patents.

SNOW PLOW AND EXCAVATOR.—Anstin H. Jackson, Bear Valley, Nevada County, Cal. This invention consists of a car mounted upon wheels so as to be moved along upon the rails in front of the locomotive. In the front portion of the car is placed a wheel of a peculiar pattern, which, as the car is moved forward against a snow bank, draws in the snow and delivers it into a chamber in the middle of the car, in which a similar wheel is revolving in a direction transverse to the revolution of the front wheel. This latter wheel gathers the snow delivered to it by the front wheel, and by the force of its revolution hurls it through an opening in the side of the car to a distance from the track. The inventor proposes to build one of these plows and place it upon the U. P. R. R. this winter to test its value. He is now in Chicago, where he intends to consruct the plow.

PORCELAIN VARNISH FOR PLASTERED WALLS.—William M. Kimber, Sacramento, Cal. No finish can be better or neater than a finely-plastered or hard-finished wall; that is, if it could retain its original whiteness and cleanliness, but it soon becomes spotted and dirty, and the whitewash brush must be used, which remedies the dirt, but in most cases destroys the fine finish of the wall. The preparation above mentioned is intended to be applied in a manner similar to a coat of whitewash immediately after the wall is finished. This varnish soon becomes perfectly hard, and does not in the least affect the finest finished wall, but prepares it so that it can be washed with soap and water when it becomes dirty.

GATE LATCH.—Daniel Sheets, Suisun, Cal. This invention relates to a gate latch of cheap construction and great simplicity. The inventor has here combined a gate latch with a lock or bolt, by which the latch can be locked when desired.

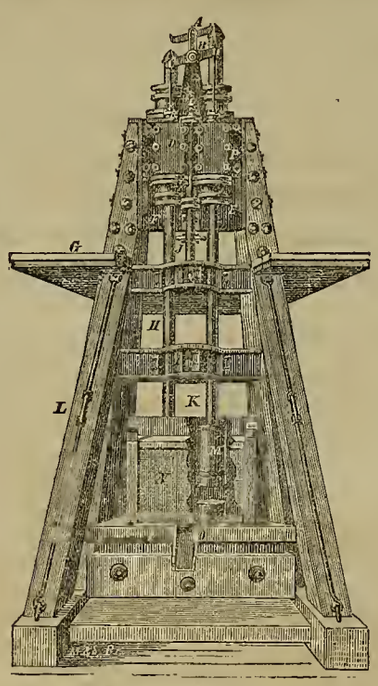
Experiments with Gun Cotton.

The favorable reports upon the use of gun cotton from abroad have led to a number of experiments in the Eureka mine, Grass Valley, a small supply having been procured from England for that purpose. The cartridges used were about an inch in diameter, and in length according to depth of hole, and were exploded by concussion, a cap being employed similar to that used in exploding giant powder. Gun cotton will not bear any heavy tamping, on account of danger of explosion. It would accordingly tear out the top of the holes, but its effect seldom extended to the bottom or laterally. In slanting or overhead shots, on account of the difficulty of retaining the sand tamping in the holes, it was found to be of little use. Further experiments are to be made. In an open quarry it is thought that it would answer.

VIRGINIA'S RAILROAD.—Twelve miles of track have been laid on the Virginia and Truckee Railroad. All the iron is on the ground, and by the middle of November the whole of the main road will be completed. Mr. Yerington, the Superintendent, has been laying from a mile to a mile and a half of track a day.

Taylor's Improved Steam Stamp Mill.

We give, herewith, a perspective view of Taylor's Improved Stamp Mill, now on exhibition at the Mechanics' Pavilion. This mill, as will readily be perceived, is designed for crushing quartz by the application of steam direct to the stamps. Many attempts have already been made to accomplish this object by devices variously contrived, all of which have met with a greater or less degree of success; but none have so far succeeded as to reach any extended use. In the machine herewith presented much effort and ingenuity has been expended by Mr. Taylor in avoiding the mistakes and imperfections which have been observed in previously constructed mills of this kind.



TAYLOR'S IMPROVED STEAM STAMP MILL.

This machine consists of two stamps driven by the direct application of steam to the stems, which form the piston rods of two small steam cylinders placed at the top of the battery frame. The principal improvements claimed consist:

First.—In the simple and effective valve gear, which consists of a T-shaped cam, surmounting a horizontal shaft which is attached to the valve rods by a small beam. This cam is moved by the last 2½ inches of the up-stroke of each stamp. By this arrangement the up-stroke is met by a full open port of steam, when the piston is within one inch of the cylinder head, reversing the motion and giving the full force of the steam to the down stroke, and at the same instant opening the lower induction port of the opposite cylinder, which raises the stamps connected with that cylinder, and reverses the valves; thus securing a counter-balance of pressure on the cylinders, they being both cast in one piece.

Second.—In an arrangement by which the cylinders can be raised or lowered so as to give any desired length of stroke; and to compensate for the wear of shoes and dies. This arrangement consists of casting upon the outer side of each cylinder, flanges, forming a V-shaped groove, which run on slides cast on the plate connecting the battery posts, to which the cylinders are secured by four bolts. These bolts being loosened, the cylinders may be readily raised or lowered by a screw and hand wheel.

Third.—In order to make the above arrangement practicable, expansion steam joints have been applied to the induction and exhaust pipes.

Fourth.—The placing of the lower induction ports one-half an inch above the lower cylinder head, thus avoiding the danger of breaking out the cylinder head by the wearing down of the stamp; as the piston would cut off the steam at this point.

Fifth.—The introduction of an improved stamp guide, which appears to be just the thing that is needed for such work. This improvement is worthy of most special notice. It can be readily applied to any mill in use—is extremely simple, easily adjustable, and almost indestructible in its main parts. The iron of the stamp is made to run against blocks of wood or metal, which are adjusted to the wear by set-screws; and which, when worn out, can be readily replaced.

Referring to the engraving, G is a platform for the convenience of the engineer, in attending to the operating portions of the mill. A is the T-shaped cam which operates the valves; the cylinders are shown at D. P is the flange, attached to the cylinders, in which the V-groove is made which slides on the V-slide marked E. The plate F is bolted firmly to the head of the battery posts. J shows the hand wheel, by which the cylinders and their operative connections are moved up or down, as required. The feeding platform is placed just below K, and in the rear of the mill; M shows one of the stamps raised above the die; D shows the trough by which the pulp is led away from the battery. The entire structure is substantially braced, bolted and tied. The right hand stamp is represented just ready to fall, the upper induction port of the right cylinder having been just thrown open by the elevation of one arm of the T-shaped cam, while the depression of the opposite arm has opened the lower induction port of the opposite cylinder. This battery is constructed to discharge both in front and rear.

The cost of a mill of two stamps, like the one on exhibition, which, it is claimed, will do as much work as an ordinary mill of 15 stamps, will be about one-third that of the latter, with its driving machinery. Moreover, as the amount of machinery to do the work is reduced to one-fourth of that ordinarily required, the wear and tear must also be greatly reduced. The large amount of work accomplished, to the stamp, by the use of a mill like the one here presented, is due to the rapid repetition of blows, and greater impact given to the stamps.

The Overland Monthly—Is it Established?

The November number is out with a number of very attractive subjects (of course) in its table of contents: The Chinese Labor Problem, Ceylon, Fur Seals,—and a very little bit of sentiment, if any, besides the poetry. The *Overland Monthly* pays the publisher, and the editor, and the writers, all. There is, therefore, no doubt left on the question of its permanency. But even if the income were not equal to the expenses, the *Overland* would yet be a success; for it has now come to be well known and appreciated by a great community of readers, to every one of whom it is counted worth triple its price in cash—in fact, indispensable. Not only are we all obliged to buy it in numbers, on account of the valuable special articles it contains which must be kept, but we find it economical to have an extra copy running along, to send to our friends in the East. The *Overland Monthly* is the organ of the intelligence of the "Far West;" it is the index of the life of that constituency. We find far from all its articles good. The *Overland* writers occasionally deserve sharp criticism, as do the *Atlantic* writers, and some others of the magazinists who are not deemed worthy of such attention. Newspaper readers are tired of seeing the *Overland* praised. Let it meet the ordeal of a liberal pointing out of its faults wherever deserved.

THE AUSTRALIAN DIAMOND AS "BIG AS A LEMON."—Either a diamond or a topaz certainly, has been found in the gem sand, the formation characteristic of diamonds in Australia, discovered on the Sydney side, near Mudgee; and *if* a diamond, it is worth $20,000,000 or more, weighing nearly eight ounces, or about 900 carats, or 3,600 grains. The total value of diamonds found in Australia before the end of 1866, is reported to be $400—less than the value of those found at Cherokee Flat, in Butte county, which have been worth in all probably more than $500. Since the close of last year, new diamond diggings have been discovered in Victoria. In July last, one claim turned out 119 diamonds, one weighing 5½ carats.

Mechanical Progress.

New Steam Boilers.

S. C. Salisbury has planned a boiler which is thus described in the New York *Tribune:* "The coldest water comes rapidly in small quantities between two hot plates under such a pressure as to cause a circulation from the main boiler to the water arch. This arch is surrounded by intense heat, and the circulation is increased in rapidity just in proportion to the amount of heat in the furnace; and as it increases, it brings the colder water in contact with the hot plates, so that it absorbs the heat as fast as produced, and becomes highly heated. It is then discharged in the chamber above the water line in form of wet steam, and as it is driven in all directions among the tubes, they again supply the heat to prepare the steam dry for use. By this process an equalized temperature throughout all parts of the boiler is kept up.

Another boiler, illustrated in a late number of the London *Engineer*, is a "cylindrical shell with an internal cylindrical fire-box, from the crown of which water-tubes are suspended, hanging free into the fire. Into each of the water-tubes a siphon is inserted, which extends down into the water space of the boiler a short distance beyond the ends of the tubes. These siphons act as circulating tubes when the boiler is at work, supplying the water-tubes constantly with water from the water-casing, where it has a tendency to keep cooler than in the upper part of the boiler; by means of this circulation the temperature is equalized. The siphons avoid both scum and sediment by taking the water midway. When the boiler is blown off, the action of the siphons is to empty each tube entirely, and any dirt which may be present will be blown out."

Theory of the Blast Furnace.—The following is the opening paragraph of the chapter devoted to the blast-furnace theory in Prof. Crookes' new reproduction of Kerl's Metallurgy: "The treatment of an iron ore mixture in blast furnaces aims at the reduction of the oxidized iron, the carbonization of the reduced iron, and the separation of the carbonized iron from the slag-forming components by smelting. As iron is very refractory, but easily transformed by an admission of oxygen, the ore mixture and the fuel are charged in alternate layers in the furnace. By this means a uniform reduction and smelting of the ore is obtained by its direct contact with the coal and the ascending reducing gases respectively, and also as small quantities only are gradually smelted. If ore and coal were mixed together the coal would prevent the combination of the slag-forming components. And if the ore and fuel were charged in separate vertical columns, as is done with lead, silver, copper, tin and other ores, the reduction would not take place uniformly, the temperature in the smelting zone would be insufficient, and the pig-iron before the tuyeres not sufficiently protected against the blast. When charging in alternate layers, the lower charge of fuel produces the heat sufficient for smelting the ore charge lying above it."

Coned Car Wheels.—Joseph Fox writes the London *Times* that the "coning" the tires of railway wheels, with the view of facilitating their passage round curves, is a mistake. It not only fails to gain that end, but it causes such oscillation of the car, as greatly to increase the strain and the wear and tear;—and consequently, the expense of operating the road. Moreover, the dangor of running off the track at high speed, is much increased by this oscillation. Mr. Fox, who is a railway builder, has in the rolling stock, departed from the usual form,—an inclination of one in twenty,—and used only cylindrical wheels; and he writes that he has been highly "gratified with the satisfactory reports of the steadiness of trains supplied with them."

Steam Hammer Improvements.—The Pittsburg *Commercial* says the Steam Hammer Works in that city have adapted to steam hammers an improved balance slide-valve, and an improved extension cylinder head, which is constructed in such a manner as to permit the piston to be withdrawn, packed, and replaced in from three to four hours.

Atmospheric Brake.—The "Westinghouse brake" is thus described: "On the locomotive under the foot board, is a reservoir, and an auxiliary air pump which supplies this reservoir with air of from 50 to 60 pounds pressure. Under each car is a small cylinder, connected with the reservoir by an inch pipe, through which the air passes into the cylinder, the piston of which is driven out and thus applies the power to the ordinary handbrakes. Between each two cars, extending from one platform to the other, is a gum coupling, the valves of which are so arranged that when together there is a free air passage, and when the cars are separated, the valves close and prevent the escape of air out of the pipes. Each car is independent of the other. On the engine there is a three way cock, by which the brake is worked. When turned one way, it lets the compressed air from the reservoir into the pipes; when turned the other way, the air is permitted to escape from the pipes, and that releases the brakes. The engineer alone can work the brakes, and can use them to any degree of power he sees fit by letting more or less air into the pipes."

The "Setting" of Cement.—The *Engineer* says the cause of this has not yet been satisfactorily explained. Schulatschenko recently repeated the experiment of Fuchs, of mixing 100 parts of pure silicic acid, obtained from water glass, with 50 parts of lime under water, and found that the mass soon set. Such another mixture was raised to a bright red heat; and, when subsequently treated with water in like manner, it also became hard. That a chemical combination had taken place in the latter was shown by the comportment of pounded quartz with lime. By heating these together a silicate was formed; for from the ignited mass acids separated gelatinous silica. In the second experiment, therefore, the hardening of the cement must be due to the formation of a hydrate. In a third case a similar mixture was heated till it fused, and the powdered product, when placed in water, did not set.

New Process of Refining Iron.—Under this head, the *London Mining Journal* describes a recently patented method which consists in subjecting molten cast-iron to the action of soda and soft hematite iron ore—or other oxide of iron—previous to puddling. For this purpose the molten cast-iron is run into shallow pans of a depth of 3 to 5 inches, and lined with a paste composed of a mixture of the materials above mentioned. When the metal is poured, a violent ebullition takes place, and a large portion of the silica—together with some of the carbon, phosphorus and sulphur contained in the iron—is carried off in the slag, so that when the slabs of purified metal are subsequently worked in the puddling furnace, the operations are effected much more rapidly than with ordinary pig-iron.

Vises.—A still further improvement in "Parallel Vises" is an adjustable collar, which causes the jaws to open or shut, upon the slightest movement of the handle. There is thus no lost motion; and again, if the shoulder on the screw should wear, the collar can be so adjusted in a few moments that it will operate as readily as when new. Another improvement, is an adjustable spring so arranged as to hold the handle of the vise in any position or angle at which the hand leaves it.

Transparent Paper for Draughtsmen. If the paper is damped with pure and fresh distilled benzine it at once assumes a transparency, and permits of the tracing being made, and of ink or water-colors being used on its surface without any "running." The paper resumes its opacity as the benzine evaporates, and if the drawing is not then completed, the requisite portion of the paper must be again damped with the benzine.

Boiler Incrustations.—M. E. Wieder hold, by a series of experiments, continued for a length of time, has fully proved that the addition to the feed water of fatty clays, especially the kind known as fuller's earth, entirely prevents boiler incrustations, even where very hard water has to be used. A loose, soft mud is deposited as soon as the motion of the water ceases, and runs off when the sludge valve is opened.

Phosphorescent Door-Numbers. — A French chemist who had probably hunted in the dark for a street number, has invented a method of making the figures and letters visible at night,—which consists in rubbing them with a prepared phosphorus-paste of his own devising.

Scientific Progress.

Grahamite—A Remarkable Mineral.

Prof. Henry Wurtz describes in full, in a paper read before the American Association, and now published in the *Gas Light Journal*, of Oct. 2d, this extraordinary mineral, named by himself, which he has examined with care both *in situ* and in the laboratory. He says: It is not only new, but it cannot even be *classed* with certainty as yet, with any other mineral substance known. It gives out no odor when rubbed or heated. To the action of acids, alkalies and oxidating agents generally, it is quite indifferent. Concentrated boiling nitric and muriatic acid, and even *aqua regia*, have no action whatever upon it; nor has boiling sulphuric acid, if somewhat diluted. Oil of vitriol, however, even in the cold, forms a brown solution. The most concentrated caustic alkaline solutions are totally without action upon it. Alcohol does not dissolve a trace of it. Naphtha, benzole and ether dissolve part of it; oil of turpentine gradually swells it up into a tar-like magma, and then dissolves most of it; but its true solvents are *chloroform* and *sulphuret of carbon*, each of which apparently dissolves nearly the whole mass of the mineral with great rapidity, leaving nothing except the mineral matter (ash,=by analysis, about two per cent.,) and some small proportion of coaly matter. When heated in the open air it endures a temperature far above that of the fusing point of asphalts without change; but when heated above 400° F. it begins to decrepitate, smoke and soften, behaving very much like a highly caking coal.

It has been pronounced an "inspissated petroleum" by Professor Lesley, whose acquaintance with it was, however, limited to the inspection of a few specimens, without visiting the locality. It was found in West Virginia, and occupies a vertical *dike-fissure*, cut across by a deep ravine. Prof. W. measured the horizontal extent of visible outcrop, and found it 530 fathoms —and 30 inches thick at one end, 8 at the other; the thickness at the bottom of the ravine, 70 fathoms lower, being on an average 50 inches. His idea of the manner in which it was found is, that the fissure opened at the moment, by the expansion caused by heat, was filled by an exudation, in a pasty condition, of a resinoid substance derived from some metamorphosis of unknown fossil matter contained in deep-seated strata intersected by the fissure or dike. It is not necessary to suppose a degree of fluidity greater than that of semi-fused pitch, or inspissated tar. Such a soft *doughy* mass, though flowing but slowly, would *in time* be forced by a very moderate pressure into every portion and into every crevice of the fissure. He considers it plain that it could never have been in the condition of fluid petroleum, for the reasons, first, that it did not penetrate the surrounding porous sandstones, and second, because nothing of the kind was ever known to have been formed by the oxidation and inspissation of petroleum.

Prof. Wurtz has recently decomposed grahamite into two distinct resinoid substances to which he has given the names *Viscosine* and *Irisine*. He has since found both these new substances in some asphalts which he has examined. The curious mineral in Colorado, reported four or five years since, believed to be albertite, and which he has recently had an opportunity to examine, he pronounces grahamite—almost identical with that of the West Virginia dike.

Fossils from Laurentian Limestones. Dr. Le Conte has brought home from the Laurentian limestones, a bushel or so of fragments of what Conrad, Tryon and other conchologists of the Academy agree in thinking to be a huge shell, whorled like a snail shell, a foot or two in diameter, turned into calc spar, coated graphite (proving its organic character), and a cast of its interior made out in iron ore. If this determination of its place in the order of animals be maintained, the discovery of its place in the order of the rocks is astonishing enough. But not more so, perhaps, than the recent discovery of highly organized plants in an almost identical position. A Scandinavian professor by the name of Torell has discovered stems, like those of reeds, neatly and finely fluted, with branches and rudimentary leaves, perfectly well preserved in the fucoidal sandstone layers lying at the very bottom of the Cambrian system, unconformably and immediately on top of the inclined edges of the Laurentian granites of Vestrogothia. —*U. S. R. R. Register.*

New Theory of Metamorphism.

Prof. Montagna, of the University of Naples, has just published a new theory of the metamorphism o rocks founded on "the phenomena of fossilization." It is written in the cause of the new school which repudiates all idea of the "granite floor" and "granite fusion," a "molten globe," etc., but prefers to see in granite nothing but sandstone, the particles of which have had time to rearrange themselves under the influence of moderately hot alkaline waters and great pressure. In spite of the tendency of this metamorphism to distort and destroy all fossil forms, Prof. Montagna announces his discovery, in granite, of vegetable remains, consisting of portions of *Lepidodendron* identical with species found in the coal measures; also of *Lepidodendron sexangulare* in a compact serpentine, and in certain porphyries. Vegetable remains are also cited as occurring in syenite. About seven-tenths of the numerous specimens of granite and granitic rocks examined by him prove their aqueous and stratified origin, by yielding plant remains, which are more evident the finer the grain of the granite. He remarks that these vegetable remains forbid the idea of heat being the agent in producing the metamorphism of the rocks. The *U. S. Railroad Register* says that Prof. Frazer, of the University of Pennsylvania, had an opportunity to examine Prof. Montagna's specimens of *Lepidodendra*, etc., from the granite of Southern Italy, during the winter of 1867-68; but to his eye their organic character was not indisputable.

The Swedish Expedition.—"Part of the expedition made a second attempt in September to reach the pole. Their ship touched 81° 42′ N. (17¼° E.); probably the highest latitude ever attained by any ship. The ice pack to the north, although broken, would not admit a boat, and its edge tended south as they went west, to 79° N. to 0°lon. Greenwich. On this stretch they met, several times, ice black with stones, gravel and earth; which would seem to indicate undiscovered lands to the north.

Making a third attempt, October 1, they steamed north from Spitzbergen, in a fog; met drift ice in 80° 40′, and followed its edge northwestward to 81°, and were then disabled by crashing against an iceberg, and forced to return, with two feet of water over the cabin floor.

Of all the expeditions in this direction, none but this has tried it in the autumn, after the melting of the summer ice and before the forming of fresh pack. It seems possible to reach 83°N. latitude at this season; but it seems settled that no further progress at this or any other season is possible, and the voyage is dark, cold and boisterous, with snow storms and dangerously heavy seas."—*Silliman's Journal, Sept.* 1869.

Rapidity of Photographic Action.—"The image of the full moon can be fixed in less than one-fourth of a second, and that of the sun "instantaneously." According to the experiments of Mr. Waterhouse, a space of time no longer than one twenty-seven-thousandth of a second is required to fix the solar image. Even this small fraction, however, inconceivably short as it appears, is a tolerable length of time compared with that in which photographs are taken by the electric flash. The duration of the illuminating spark, according to the experiments of Mr. Wheatstone with his delicate chronoscope, does not exceed the *millionth* part of a second, and yet a clear and distinct photographic image is obtained by a single electric discharge. By this means may be shown the real form of objects to which a deceptive appearance is given by their rapid movement. If a wheel on whose side any figure is drawn in conspicuous lines be made to rotate with the greatest possible velocity, the figure will present to the eye only a series of concentric bands of different shades. Let it now be photographed while in motion by the electric flash, and the wheel will appear stationary with the figure perfectly well defined."—*Prof. Merriman.*

Sulphide of Carbon Deodorized.—The offensive smell emitted by this substance may be removed by washing it first several times with water, and then introducing it into a large retort with a quantity of quicklime. After twenty-four hours' contact, the sulphide is distilled from the lime and received in a flask, in which has been placed a large quantity of copper turnings, previously calcined to remove organic matter, and then reduced by heating in a current of hydrogen.

REVIEW OF THE FAIR.

Classification of Articles.
CLASS XV.

FURNITURE, UPHOLSTERY.

Many of the notable articles under this class have already been referred to in detail, leaving for this review nothing necessary beyond a brief recapitulation of what there is in the Exhibition. Nearly all of the useful and ordinary kinds of furniture actually purchased in the stores here, made of walnut, pine, oak, etc., is imported, the bulk of it from Boston. Only the finer kinds are made here, of imported wood, or laurel, and Oregon pine, or sugar pine. No finer furniture is made in the world than some of that turned out from the shops of N. P. Colo & Co., Geo. Whitney & Co., and Goodwin & Co. The articles from these establishments, shown in the Exhibition, are, necessarily, about the same—chairs, bureaus, bedsteads, sideboards, etc.—but differ widely in their style of architecture and ornamentation. Mere description will scarcely do justice in this respect. Let those interested—everybody—go and see for themselves, while the best products of all are so easily comparable. All the wealth of the Eureka, the Hayward or the Eberhardt mines, could not require anything better than is made for their money by our San Francisco mechanics, with unexceptionable, and even highly artistic taste.

Handy Things and Inventions.

There is plenty of opportunity for the exercise of ingenuity in the design and arrangement of house-furnishing materials. Doremo & Strout make a fine hook-case and washstand (to appearance), which, on touching a spring, will open out into a first-class bed, complete in every respect. Another happy arrangement is the sofa-bed or "magic divan" of Thornton Westley, with G. O. Whitney & Co. Ordinarily it is the simplest and plainest of divans, very easy and comfortable. The back turns forward, and adds its breadth to that of the sofa. Its advantage is that it is cheaper than any other divan—about $27—of first-class material, hair stuffing. Mr. Westley also exhibits Howes & Hinkle's bed bottoms, consisting of wooden slats, very cheaply contrived into a bed bottom, that equals the spiral spring in some respects.

School furniture of all the approved kinds is exhibited by Warren Holt of the Pacific School Institute. Some of these articles in which patented iron castings are used in connection with legs or backs, are exceedingly handy as well as economical, for offices as well.

The window fixings and curtains of Whitney & Co., are superbly rich, as specimens. The outside adjustable awning of McDonald & Withers is one of those articles of comfort which are apt, from carelessness of the importance of small matters in life, to be neglected, yet which would be universally used by all who practice the arts of being comfortable, were they once acquainted of its merits. It is a means of tempering the light of the sun, and the winds and sands of our hilly city to the fancy or convenience of dwellers on exposed sides.

An inside window curtain roller of great merit, intended to admit of the regulation of light and air, from above as well as below—a thing quite impracticable with the ordinary curtain—is the Tay double roller, which rolls up the curtain to perfection mechanically, from the top or bottom, as may be preferred, and holds it in its place. The invention consists merely in a simple arrangement of cords, which is quite inexpensive. Mr. Tay has secured letters patent for this useful device, through Dewey & Co.

E. F. Hartshorne's patent shade roller rolls up like the ordinary one, from below, by the use of a spiral spring inside of the wooden roller. It is very effective, useful, simple and durable, and will answer a good purpose for mounting maps.

Carving and Inlaying.

Very tolerable carved work on a picture frame is shown by E. G. Piccaroli; and inlaid work by J. Gerhard, G. W. Pilheam, Elias Miller, and L. Castagnino, all in the art gallery. The latter artificer's work is especially worthy of examination, the number of elaborate figures in different colored woods on his tables and toilet sideboard being a wonder of patience, in this highly materialistic and utilitarian latitude and longitude.

Wire Work.

H. T. Graves again makes a splendid exhibition of a wire summer house, of patent spring seat chairs and wire cages, iron sofas, sieves, and a dozen other useful and ornamental new applications of iron and brass wire, which gratify taste and please the spectator on account of their ingenuity. Wire, it seems, is yet destined to be worked into all kinds of fabrics, and to be used for every imaginable purpose, in this extremely iron age.

Miscellaneous.

To this class belong also the birch bark child's cradle, made by an Indian woman 120 years old; the tea caddy of Henry Coms, composed of 3,305 pieces of wood and ivory; Strahle & Hughes' Laurel Palace and billiard tables,—the pyrographic wood ornamentation,—and the pictures frames in the art gallery, all heretofore described; piano stools of varied design, by Kobler & Chase; easy chairs, by Mrs. H. E. Morton and A. Litzeus, which are recommended to the attention of the luxurious; Forbes' pet of the boudoir, a sheet iron bar, with growing plants and flowers attached to the furniture, with very pleasing effect; the Elastic Sponge Co's stuffing; Wendel's drapery and lace curtains, done up on elastic frames and chenille fringe; Clark's paper hangings; Spaulding's window screen and sample of pressed wood; and Smith's shade fixture, working like Hartshorne's, but by a clock spring not on the roller.

Iron garden furniture is exhibited by Jacob Schreiber. The catalogue furthermore makes mention of some ladies' work tables made by Charles Gardner, which would be hunted up and carefully scrutinized by us, probably, if we were of that interesting sex; of Romer's polishing specimens, showing the effect of renovating rosewood; and of Hibbard & Sanborn's combination-wood posts, railings and balusters, referred to under "Wood Work."

CLASS XVI.

THE ARTS—FINE AND ORNAMENTAL.

Sec. 1—Oil Paintings.

Art in San Francisco is not an outgrowth or evidence of the luxury and wealth of the community. What there is of merit is here accidentally; yet we have amongst us the first of living artists; and California can boast having had more or less to do with the career of many men of merit who have wandered hither in search of adventure or of the beautiful. They generally "get out" at an early opportunity. The San Francisco public buys pictures at auctions—picture auctions—at bargains; painted, if the artist can paint at all, by wholesale, and for the eye of auction bidders, the frames being in this case, usually the principal item of cost.

There is something in our scenery and life that fosters art. Neal, the successful Munich artist, began as a San Francisco photographic colorist; Jump has jumped from here into a better situation East; Toby Rosenthal had his artistic ambition excited by scenes encountered as a boy in the streets of San Francisco; Keith has become inspired by our grand mountains, and has left us.

Nahl remains. Nahl has a certain work to do for California, or he would have shaken the dust of San Francisco from off his feet 15 or 18 years ago. Last year his picture of Joaquin remained for two months after the Mechanics' Institute Fair before it was sold, at $200. He is engaged on remunerative orders, but should be more widely appreciated for the points in which lies his peculiar strength,—the portrayal of life and motion in scenes of heroism and adventure. The small picture of the calf and Indian girl exhibited by him this year, will serve as an example of the motion in which he would excel even in the Dresden gallery, the new Panakothek, or the Royal Academy. Objection is made to the Bridal Race on account of stiffness, but the picture should be seen at a sufficient distance, when it will be found very true to nature in the matter of motion and sentiment.

California and Oregon have enacted history, and more, since 1849. Books can perpetuate but little of it all. The artist is requisite,—but not the auction artist. Our times call for the man who works not chiefly for pay, but from love of the scenes that he portrays. Nahl's pictures of Californian and explorer's life would bring higher prices in the East, and in Europe, to-day, than they are doing here. It is fortunate for us, and for our future literature and the character in history that is to belong to the gold adventurers of the 19th century, that there was a certain infatuation, perhaps a passion, that prevented Nahl from returning long since to communities where he would be judged according to his merits.

The Bridal Race was painted to order for Charles Crocker, Esq.

Toby Rosenthal's "Joys and Sorrows of Spring" is sold for $650. Toby is really considered a very promising artist by his superiors in Munich, and will certainly find remunerative occupation in the East, if he does not in California—which is a matter of doubt, unless he should paint for the auctions. He will go to Rome, and remain in Paris for a time.

The Press has already made reference to Walker's and Wilson's pictures. The former paints western coast and marine scenes,—our glorious Panama voyage sunsets, with our own helmet rock and ocean beach thrown in; besides portraits of merit, the one of himself being excellent. Wilson's landscapes are English and Scotch. Denny loves the roar, and sweeping, and tossing of a storm. His top schooner in a cyclone, pilot boat No. 2, wreck of the Viscata, and sunset in the Golden Gate on a drizzly winter day, are all pictures worth having.

Burgess' water colors, on Frazer river, and Yosemite, and Sevcrance's coast scene in the Sandwich Islands, are very pleasing, and show favorably the points of superiority of water color over oil. Burgess' portraits are much admired.

Bush's Straits of Carquinez and Castle Peak do justice to him, being rich and true to nature. His Donner Lake, Tahoe, etc., are inferior, and should not have been exhibited at all, in justice to himself.

Hannah Millard's Study in the Woods, water color, evinces a taste and skill that will accomplish other successes.

Section 2.—Statuary, etc.,

Mezzara's cameos are really superb, and they would be enough for one artist to place into one exhibition. Mezzara is a first class artist in cameos, such as would command large prices even in Europe, under the competition of the best competing sculptors laboring in that field of luxury and taste. And there is something so pleasing in a fine cameo, which meets and gratifies the eye of everybody, and everywhere, that it deserves the title of pre-eminence in popular art. Cameos are sometimes cut into a kind of mussel shell, in which there is a pure white and a flesh colored layer, the former being used for the features of the face, and the latter for the back-ground. But they are much more valuable when cut into agate, opal, or carnelian, with similar strata, because more permanent. We have cameos from the times of the ancient Greeks and Egyptians, who practiced the art of cameo cutting. Artificial preparations, were then, as now, used for the same purpose, the *vitrium obsidianum* of Pliny having been something of the kind.

The life-size bas-reliefs of Mezzara, modelled in plaster and composition, are equally meritorious, as evinced especially in the features of William Alvord, "L. P." and Judge Field. His life-size nude statue of the Goddess of Music discloses lack of laborious study from life models, which is the foundation of the sculptor's success. This statue is purely animal—has nothing ideal in it like the exquisite "creations" of Palmer—and is far from perfect as an animal representation. Palmer, the Albany sculptor, by the bye, has never been to Europe to study the renowned productions of classic sculpture. He creates only after the creator, models into stone only beautiful things fondly sought for and found by him in American character and life. He is, therefore, pronounced the most original, and by many the greatest sculptor living. He adds something new to sculpture that will stand and be renowned in future ages, by the side of the immortal stones from the ruins of Greece.

There is quite a batch of statues at the Fair, but they strike us as nearly all between ordinary and bad. "Hope," exhibited by Leon R. Myers & Co., is a worthy exception—a thing of beauty that will bless the purchaser.

Photographs.

Our grand and peculiar scenery, of mountains, plains and valleys, is no longer a novelty, and the world renowned photographs of Watkins, and Houseworth, called into existence by these natural surroundings—art propagated and bred by nature in this favored clime—cannot be dwelt upon in '69 as progress to be chronicled. Watkins has added to his store of fame many of the inspiring scenes of the Columbia, and a few of the northern coast. "Helios'" Alaska scenes, we regret, are not in the Fair. The beauties of Puget Sound, the Georgian Channel, and the northwest coast, are as inexhaustible as the coasts of Norway; and by the time that our Northern Railway is finished, or sooner, we shall require photographs of those beautiful shores for tourists, as we now have them of the Yosemite.

If anything deserves decidedly favorable mention this year as an advance in the photographic art on this coast, it is the Rembrandt style of photograph exhibited by Bradley & Rulofson. These artists last year made nautical and rustic scenery of backgrounds a specialty, by which the mechanical stiffness of common photography was to some extent relieved. This year they have something new which is creditable, because it evinces and requires the addition of artistic qualifications to those of the common photographer. We refer to their novelties in the management of light. The art of photographic "artists" generally consists in posing, and screwing the sitter's head, and delaying, until there is scarcely an iota of natural expression left in him, unless he be a consummate actor. Women from this cause (?) usually photograph better than men. When nature cannot be modified in the result, let the photographer make the most of his accessories. The "Rembrandt" photograph brings out beauties of countenance and expression that we have been in the habit of deeming beyond the scope of photography.

Of the other first-class extensive photographic exhibitors, Kisin excels in his large rural and cottage views; Bayley & Winter, in their large photograps from line engravings, porcelain pictures, and large colored portraits; Shew, in his very large plain portraits of all the notables of the Far West; J. A. Todd, of Sacramento, in excellent cabinet portraits, and the handsome features of the persons photographed; and Vaughan, in life size photographs retouched in oil.

Wood Engraving and Lithography.

Mr. George H. Baker's lithographic establishment has produced much that is woven into the history of the Pacific coast, a mere hint at which is conveyed in the few designs placed on the walls of the statuary gallery. The specimens of wood engraving on exhibition, are placed in the catalogue in Class XII, and have been previously noticed in this review.

Drawing and Penmanship.

Seregni's lettering, penmanship and pen drawing, done in imitation of steel engraving, is superior to anything of the kind ever produced in these Fairs, and is worthy of being classed amongst works of art. The Pacific Business College and California Business University, show about a dozen frames of model penmanship in many styles, none of which suit us as well as the heavy, large, round Scotch hand, that we sometimes meet with by an old country clerk. The architectural drawings of R. M. Williams and J. E. Wolfe look business like, and are certainly good.

Section 3.—Sign and Scenic Painting, Staining and Graining.

Chefs d'oeuvre from the principal sign painters, are on hand, in fine style, as usual. Amongst the new things to be mentioned is a peice of fresco painting by F. Pellegeine, which is scarcely large enough to display the artist's taste or capacity. Perfect specimens of graining and imitation staining, are exhibited by G. A. Brush, near the burglar-alarm cottage.

Section 4.—Wax Work, Hair, Moss, and Artificial Flowers.

A column could be written on this class alone, which would prove, however, more personal than interesting or instructive. It would be pleasant to dwell upon the history of almost any of these productions of feminine art. There are beautiful shells, and delicate mosses, and the hair that betokens the life of loving ones,—gathered in days of extreme happiness, or of sorrow perhaps, and stored away in little boxes and glasses, for years, but finally worked in odd moments of leisure, into products of taste in many cases exquisite. How much of sentiment or of the heart can enter into a simple little manufactured commodity, none can tell but the manufacturer. Sea shores, woods, mountain tops, lakes, homes and associations the most precious. Wax working and artificial flower making rise to more importance, being neither more nor less than sculpture, and ladies who engage in them should not dawdle on posies merely, of the common sort, but attempt faces, and designs for carvings and plaster casts. Potters' clay will work better than wax, but must be kept wet to prevent cracking. Sculptors work in clay.

The shell frames of Mrs. John C. Daggett are unusually elaborate, and are of value conchologically, being very varied and numerous, and of the natural color. Miss Blauche's wax work has the beauty and

purity of design of angel hands. Naughty Mary Pennie has made a wreath of poison oak, yet is not poisoned. Indian wax work from Mexico; bead-work and embroidery of real merit, by Miss M. A. Murphy, Mary Barron, Maria Sutherland and others, and Mrs. Cook's hair jewelry, in five frames, etc., are worthy of special mention and examination.

CLASS XVII.

MUSICAL INSTRUMENTS.

Except Zech's pianos, there is nothing native or new whatever to mention, under this class; and Zech's enterprise in San Francisco has been heretofore commented upon. One thing seems certain, that if Zech did not make better pianos at the price of the imported, his establishment would very soon have to stand idle. He exhibits five pianos, and one set of piano keys, to enable the curious to study the anatomy thereof, besides desks of his own make.

Large and interesting exhibitions, to musicians, are made by Rosenberg, consisting of upright pianos, cabinet organs, harps with Paganini strings, etc.; and by Kohler, Chase & Co., consisting of Mason & Hamlin organs, Chickering pianos, etc. Brass Band instruments by Willis' band, with many winds and turns, are exhibited and for sale.

The only novelty is Schoenstein's orchestrion, a very large machine of its kind, with organ trumpets and bellows, and quite a number of extra cylinders (four feet by eight inches), on which are pricked the little creators of inspiration. A good ear for music will frequently prefer,—from the pleasure it conveys,—the hand organs to the machine music made by a noisy brass band, in the common mechanical performances to which we are treated, and supposed to listen to with delight. Soulless playing and soulless singing are a worse nuisance than mechanical music, because more pretentious, and more empty; the latter evincing the sentiment at least of a master mechanic, if not master musician.

CLASS XVIII.

FIBROUS TEXTILES AND FURS.

SEC. 1—WOOL AND TEXTILE MANUFACTURES.

We can well dispense this year with a showing of the products of the North Beach and of the Mission Woolen Mills, since we have a fine display from the Capital Woolen Mills, and from the Oregon City Woolen Mills, both of which establishments are new developments, dating since the holding of the last Fair. The showing in each case is modest, but like all else that hails from the interior, has an air of the bravely substantial.

The Sacramento Woolen Mill, through Mr. Greenbaum, the agent, at No. 119 Battery street, exhibits blankets, cassimeres and flannels, in variety and quality, embracing, it would appear, as much as could be found in an importing house, and in several respects more. The Oregon City Woolen Mill has a number of plain articles of cassimeres chiefly, made evidently for the market that demands them, and with a view to competition against importation. The agents are Brown Brothers, No. 4 Battery street. Barouche robes, mats, specimens of ramie, flax, Peter plant, and colored sheep skins, are also to be seen. The Pioneer Wadding and Batting factory of Hahne & Co., and the list and rag carpet weaving establishment of Alex. Mackay, are specialties of manufacture, highly profitable to consumers as well as to the producers. The former makes a very cheap and warm substitute for blankets; the latter a serviceable carpet for kitchens and country houses.

FURS.

Liebes makes a very large and interesting exhibition of Alaskan and imported furs. There is much mechanical labor expended upon raw furs, not merely in tanning the inside, but in working them through machines and peculiar processes whereby the coarser hairs are made to disappear, and only the softest down is allowed to remain. The transformation of an Alaskan seal skin under this process is so extraordinary that the raw and the market article could not, without assistance, be recognized as the same thing. A prepared or marketable specimen exhibited by Liebes, is valued at about $100; a raw skin of the same quality, costs $1.50. The profits and secrets of the fur business evidently consist mainly in the treatment to which furs are subjected, since other skins exhibited as belonging to certain animals, have undergone a like transformation. Besides seals, Liebes shows beaver, otter, mink, marten, and a number of large stuffed animals for display. His establishment employs 18 men.

SECTION 2—SILK AND ITS MANUFACTURES.

The premiums offered by the State for mulberry plants and silk cocoons, connected with which there was a proviso requiring competitors to exhibit at the Mechanics' Institute Fair, has had the effect to bring out specimens of every kind, from Los Angeles, Sacramento, Stockton and Nevada, chiefly sent by Hall, Hoag, Flint, Packard, Corbusier, Garey, Sauffrignon, Goddard, Smith, Muller and the California Silk Culture Co. The variety in size and color of the cocoons is the only thing that strikes the visitor. With all our talk, we have not yet made silk profitably. The mulberry premium is now denied; but the demand for eggs from Europe appears to be a matter of fact. J. H. Warwick brings us some native silk manufactured at Hudson, N. J. The hatters, regalia makers, shawl dealers, and Pacific Straw Works, (silk bonnet and illusion lace) completing this class, make generally rather an ordinary showing, yet enough to be of use to the student of manufactures.

CLASS XIX.

SEWING MACHINES AND NEEDLE WORK.

Very much indeed is embraced in this class, for it represents the employment and the time of just half of the adult population—that of the women, with a sprinkling of men thrown in to make our statement of the proportion true. The life and energies of half the population have little besides, that can be called industrial, to show. Our civilized society of to-day is so organized; we make it so. The gentler sex, that is so appreciated, and honored, and preferred everywhere, must not do anything but sew; and if they do that from necessity, it must be done on Jews' pay, in order that they may be compelled to learn by heart, in patient thoroughness, the hard yet beneficent (?) lesson, that their only salvation is in being lovely, and good and pure,—that men shall be led by their irresistible instincts to love and marry them. Is society's law the natural one? Both men and women rebel—many of the former, persistent bachelors who worship wealth and have no faith in women's virtues; a few of the latter, who go various ways, but bitterly to rue if they go wrong.

There are two ladies' coöperative societies represented in the Fair: the Ladies' Coöperative Union, which finds a market and compensation for sewing, and the Women's Typographical Union. Both exhibit the finest specimens of the arts of making clothing (for women, chiefly) and of typography. Concerning the latter and the launching out of women into varied employments, men say with truth that women can do about two-thirds the work of a man, and that they *will* generally do it about two-thirds as well.

For general information, worth knowing by those who ask young ladies to go with them to the theater, concerts, or the Fair, we will state that a seamstress' wages are in San Francisco $1 a day; if she can work well with the machine, perhaps $1.50; a dressmaker's wages, $2, to $2.50; "going out to service," $20 to $30 per month; a male journeyman printer getting $30 a week, a feminine typographer might earn, by the above rule $20 a week. Lady artists and engravers command irregular, and often more liberal prices,—from $25 to $30 per week, or even more.

The sewing machines coming under this class and represented—as they merely exhibit and do not compete, and are nothing new—as well as the multitude of superior products of the needle and loom that are to be seen, have all been enumerated in our classified catalogue; though there are specimens of tapestry and new tricks in seamstress' art that would be worthy of more.

IMPROVED SEWING MACHINE NEEDLES.

Two exhibits are made of easy threading Sewing Machine Needles—both California inventions—one by Mrs. Suplee, the other by Mr. John L. Boone. The former is threaded through a slot in the side of the needle opposite the eye, which necessitates the cutting away the entire support of the needle on one side of the eye. The patent claims granted in the Suplee patent, are for cutting the slot in the shape of an inverted v, (∧) so that in passing the thread into the needle it is first moved upward and then downward into the eye. The needles exhibited, however, (from necessity or convenience, evidently) are not made in that way, but are constructed quite similarly to the Ambler invention, shown in the patent office reports of 1863.

The Boone needle, instead of having a slot or niche through which to thread it, has a split, extending some little distance above the eye, so that by a slight tension of the thread against the point, the needle is so sprung as to readily admit the thread—making the act of threading the operation of but an instant, and one which can be performed with very little light. The chief advantage claimed by this over the Suplee, is its greater strength—the finger-like spring, covering the eye, acting as a lever or brace, in supporting the breaking strain upon the needle.

CLASS XX.

SECTION 1—HORTICULTURE. AGRICULTURE. SUBSTANCES USED FOR FOOD, ETC.—VINOUS PRODUCTIONS.

In stating the elements of national prosperity, agriculture takes the lead everywhere; next, mechanical and manufacturing industry, and third, commerce. The products of agriculture alone are nearly equal to both the other branches. California is no exception to the general rule. Bearing this fact in mind, it is to be regretted that the show of our agricultural and horticultural products at the present Fair is so much short of what it might and should have been. It might have been made a most interesting and attractive feature, especially to the unusual number of strangers that have visited this coast during the past five weeks. Had the full advantage of the opportunity been taken, it would have been especially potential in its influence upon future immigration. As it is, not a pound of our great staple, wheat, is shown, except a few bottlesfull put up for seed.

THE SILK DISPLAY

Also falls far short of that of previous years; yet it is sufficient to indicate that much attention is still being paid to this promising industry. Samples of trees are shown by Messrs. W. M. Haynie, F. S. George, L. Waldrum, J. H. Ferris, Mr. Burnet, I. N. Hoag and R. S. Clark, of Sacramento; also by Messrs. T. G. S. Jones, of Sutter Co.; Ed. Muller, of Nevada City; A. P. Smith and Servais Turner, of San Diego; James B. Welty, of Yolo; and F. J. Sauffrignon, Mrs. L. Prevost, H. S. Lubbock and L. Gambert, of San José; all samples from plantations of greater or less extent. Mr. O. W. Reed shows samples of a plantation of 30,000 trees. The show of cocoons and raw silk has already been noticed in another class.

HOPS.

The display of hops is confined to five bales, one each by Wm. M. Haynie, R. J. Merkley, W. Flint, W. D. Perrin, of Sacramento, and Mrs. Haas, of San Leandro.

SEMI-TROPICAL FRUITS.

The semi-tropical character of California is shown, though somewhat sparingly, to what might have been done, by almonds, from Mr. Rosenberg, of Sacramento; oranges, lemons and limes, from Mr. Ryan, of Sonoma; the same from Oak Knoll, and Martinez. Dr. J. Strentzel, of the latter place, also exhibits pomegranates, English walnuts, figs, and a choice variety of foreign grapes. B. F. Headen, of Santa Clara, exhibits oranges, almonds, black walnuts, and foreign grapes. Choice varieties of foreign grapes are also exhibited by L. A. Gould, and others; R. S. Thompson, of Napa, exhibits 14 varieties.

PEARS, APPLES, ETC.

The display of pears, apples, etc., is very excellent in quality and variety, though somewhat limited in quantity. Few things, outside from commercial facilities, are more attractive to strangers than fruits, and it is generally conceded, we believe, that while California has been steadily improving in her stock of choice fruits, the older States have made but little progress in this direction anywhere, and in many places have deteriorated. It is to be regretted that so little has been done at the present exhibition, to fill our Eastern friends with a proper degree of admiration at the pomological wonders of the country, when so much was possible.

VEGETABLES.

The vegetable growers have also lost a fine opportunity to advertise themselves, and the State. A few mammoth squashes from C. W. Tarlton, of San Jose, Robert Williamson, of Sacramento, and S. Hall, of San Leandro; some watermelons, etc., from Boggs Bros., of Sherman Island; a miscellaneous exhibit from the commission house of J. W. Gale & Co.; two 5-pound sweet and one 3-pound Irish potato, from J. O. Brown, fill out the list.

DRIED FRUITS.

We have three exhibitors of dried fruit; H. F. Hutchinson exhibits eight boxes; J. W. Peterson, four cases, and L. A. Gould, samples. Why is it that hundreds of tons of fruit are suffered to rot under our trees and vines, while we last year imported 2,200 barrels of dried apples, large quantities of dried peaches, several thousand boxes of canned fruits, 65,000 packages of raisins, over 3,000 bags of dried peas, to say nothing of large quantities of dried plums and small fruit? Drying fruit is a business which is both safe and profitable. Why do our farmers complain that fruit is so cheap that they cannot send it to market, while they are themselves buying imported dried fruit, every winter and spring? California should not only grow fruit, but put it through all the processes needed to utilize it and prepare it for the table.

SEEDS.

D. L. Perkins, the veteran pioneer seed raiser of California, is on hand as usual with his creditable show of seeds. His display this year, besides illustrating California's wonderful productiveness and the high perfection of her vegetable growths, also shows what can be done with newly reclaimed swamp and tule lands, as nearly all the seeds now shown were raised upon his reclaimed plantation on Sherman Island.

THE FLORAL DISPLAY, ETC.

The floral display, though very much dwarfed in extent from previous exhibitions, has been quite attractive and select in quality. E. A. Upton exhibits flowers in pots and cut dahlias in glass. The finest and fullest exhibition in this line, however, is made by Thomas Appleby, who exhibits elegant Japanese and other lilies, hollyhocks, Bolivia pampas, grass or fox tails, dahlias, verbenas, fresh from his nursery and beautifully arranged. Mrs. T. H. Hittell exhibits a beautiful specimen of Amaryllis plant, in full bloom. Four ramie plants and two tea plants are exhibited by R. G. Perkins; Theodore Bagge an Australian glory pea plant, and Capt. Blethen a specimen of the Peter plant and fibre. Several stalks of corn are shown by Wm. H. Davis 17½ feet high, who says he has six acres of the same sort growing which will average 12 feet high.

SECTION 2—NATURAL AND MANUFACTURED PRODUCTS.

As already stated, there is no flour or grain on exhibition; but their products is the form of bread, crackers, etc., is shown. Bread making has reached the dignity of a science, and one can form but a faint conception of the many palatable and enticing forms into which dough and its adjuncts can be wrought. The exhibit of the Boston Cracker Bakery will open the eye of the novice to the importance and variety of this branch of business. Their assortment comprises 130 boxes, cans and cases, filled with an almost incredible variety of good things invented to tempt the appetite and appease hunger. The Boston Cracker Company also exhibit an extensive assortment in the same line. John D. Feldbush exhibits a 22-pound loaf of bread.

Sugar refining has become a most important branch of industry in this city, involving a very large amount of capital, and turning out an article equal to the best of the Eastern manufactories, and at prices which have very nearly or quite destroyed ontside competition; yet the California Refinery, on Brannan street, is the only one of the several establishments which makes any exhibit. Their sugar is pressed and crystallized in the form of bricks or cakes instead of in loaves, and by a new process, lately invented by Mr. Claus Spreckles, one of the proprietors. Great saving in the cost of refining is claimed for this process.

The company exhibits crude dark colored sugar, as imported, and that which is refined—pure and white as the driven snow.

COFFEE, OILS, SPICES, ETC.

D. Ghirardelli & Co. made a fine display of spices, cocoa, coffee, broma, mustard, chocolate, cream of tartar, etc. Brigandello, Macchivello, & Co. make a fine display of farina, maccaroni, etc. H. C. Hudson & Co. exhibit fine samples of assorted spices, oils, mustard, etc., from their mills in this city. Marden & Myrick exhibit coffee and spices, etc. There are also other fine exhibits of salad oils and dressings, of starch, pickeled fruit, fruit vinegar, decorative confectionary, jellies, etc., all put up and prepared in this city. The manufacture of this class of food, condiments, etc., forms an important branch of industry in

our midst, and nearly or quite supplies the entire demand for such things on this coast.

The only display of groceries noted, is that made by Bowen & Bros., the well known and popular grocers on Montgomery street. Their display, like their goods, as a whole, is all A No. 1.

SECTION 8.—WINES, BRANDIES, VINOUS PRODUCTS, ETC.

The wine interest is quite fully represented, although many managers of large vineyards and cellars, have neglected to exhibit. Among the most prominent we may mention the house of I. Landesberger & Co., who exhibit specimens of their champagne, muscatel and still wines, which, by universal consent, cannot be surpassed by any imported. The display of Mr. A. Finke also deserves especial mention. He commenced the business of making sparkling wines in this State in 1865, after an experience of some 12 or 15 years in Europe. The display of still wines is not so large as would naturally be expected from the great numbers engaged in the business. There are ten exhibitors of wines in all, and six of brandies. We have no time or space to specify, or even enumerate. We believe that all our wine-growers who make a good article, find ready purchasers; and judging from the fact that the imports of wines reach several millions annually, there is room for a large increase in this branch of industry, to supply even the home demand. This business will grow with the multiplication or increase of vineyards. Whether such increase is destined to affect favorably or otherwise the real prosperity and moral standing of our State, is a question which is exciting much discussion *pro and con*; but it is one, which we do not propose to discuss at the present time. We are now looking at the wine business in its commercial aspect, as a great and growing branch of industry.

Of bitters, cordials, ale, etc., there is quite an exhibition. McMillan & Kester exhibit syrups, bitters, cordials, essences, etc., in great profusion. L. Cross & Co. make a large exhibit of their IXI. bitters. F. & P. J. Cassin exhibit samples of Cassin's grape root bitters, and grape brandy. There are quite a number of other exhibitors in this department.

New Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR THE WEEK ENDING OCTOBER 19th.

SNOW PLOW AND EXCAVATOR.—Austin H. Jackson, Bear Valley, Nevada County, Cal.

PORCELAIN VARNISH FOR PLASTERED WALLS.—William H. Kimber, Sacramento, Cal.

SPARK ARRESTER.—John W. Bowker, Sacramento, Cal.

GATE LATCH.—Daniel Sheets, Suisun, Solano County, Cal.

BOAT-DETACHING APPARATUS.—Daniel Brown, Astoria, Clatsop County, Oregon.

SAW.—Herman Cramer, Sonora, Tuolumne County, Cal.

AMALGAMATING PROCESS.—Paul & Wood, San Francisco.

GANG PLOW.—William Funk, Portland, Oregon.

New Incorporations.

FIRST JOINT STOCK CO.—Rio Vista. Oct. 9th. Capital stock, $9,000; shares, $100 each. Trustees: Joseph Bruning, A. H. Hawley, Geo. Frazer, J. D. Tilley and S. C. Brown.

BOOT FITTERS' COÖPERATIVE ASSOCIATION. Oct. 15th. Capital stock, $10,000; shares, $50 each. Trustees: Robert Moore, Chas. O'Brien, Dennis McSweeny, Edward Shay, Wm. Hughes, James Creed and Fred. Tomkins.

QUARTZ MINING CO.—Scott Valley, Siskiyou County. Oct. 23d. Capital stock, $50,000. Trustees: J. M. Trumble, Wm. Hobart and Louis Pitz

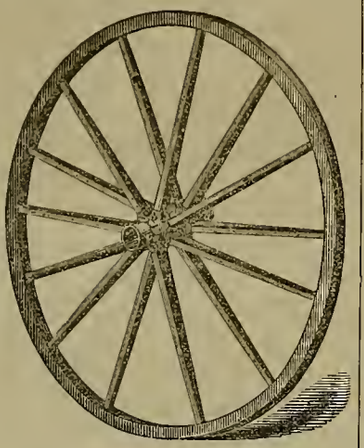
NORTH AMERICA CONSOLIDATED MINING CO.—White Pine, Nevada. Capital stock, $2,000,000; shares, $100 each. Trustees: J. F. Lewis, Thos. Wells, Jacob Bacon, J. A. Eaton and G. R. Spinnor.

MOHAWK MINING CO.—Gold Flat, Nevada County. Capital stock, $250,000; shares, $100 each. Trustees: Jos. M. Maguire, C. C. Palmer and G. W. Downey; Superintendent, Mr. Barber.

WANTED.—To rent a house of about six rooms, in a healthy location, near the business center of the city, for a gentleman, wife and baby. Will purchase or rent the furniture. Address X, box 17, P. O. San Francisco

Pool & Carlton's Tire-Tightening Wheel.

The illustration in the present number of the PRESS, represents Messrs. Calvin B. Pool and William Carlton's double extension tire-tightening wheel, which appears to be an important improvement in wagon wheels. The principle on which this improvement is based is simple, and in strict conformity to the unerring laws of mechanical force. The chief features in the invention consists of the hub, made of iron, being formed in two parts, one-half of the spokes being inserted in the part marked *a*, and the balance in *b*, which latter is moved upon *a* by the nut *c*. By this very simple arrangement, the spokes



are kept at an acute angle from the tire. This arrangement of the spokes makes the wheel very much stronger than any "dished" wheel, with the additional advantage that when the tire may become loose, a few turns of the nut on the screw which connects the two parts of the hub, reduce the hypothennsn of the angle, formed by the spokes, and consequently tightens the tire.

The principles on which such wheels are constructed adapts them for every class of vehicles, from the light sulky or buggy, to the heaviest freight-wagon for use on the smoothest "Nicolson" to the roughest side hills, because the spokes brace the wheels from all sides, and can be "stiffened up" when required in a few minutes by any man who understands how to turn a wrench.

The wheel is on exhibition near the Musie Room of the Pavilion. So simple an inventiou does not require any elaborate explanation, beeause every one who knows what a wheel should be, eau understand this one. A dry eountry like California will justify eonsiderable extra expense for a wheel that will obviate the difficultics encountered by travelers from the shrinkage of the wheels of their vehieles, and we shall look for the praetical success of this iuvention with much interest. A patent has been applied for. Further information may be had by addressing Pool & Carltou, Boise City, Idaho.

THE NEW ROBERTSON DITCHER.—Mr. W. D. Robertson has perfected his new plan of a ditching machine, and carpenters are engaged at present at the foot of Seventh street, in constructing the scow which is to earry the machinery. The scow is 47 feet in length and 7¼ feet wide on the bottom; the upper deck is 18 feet wide, and the draught of water will be abont 18 inches. It will be fitted up in the same manner as the ordinary dredging machino, but the scoop will work on a different prineiple. The scow is very strongly bolted together, and will be launched in abont three weeks. The vicinity of Sherman Island will be the first quarter where Mr. Robertson's invention will be applied.—*Bulletin.*

JOHNSON'S PATENT PORTABLE FENCE, whieh has been exhibited and admired as a useful and novel invention in the Fair, is being eonstructed, full size, at Woodward's Gardens, where its practicability will come in good play. Mr. Woodward thinks it is just the thing on his fine grounds, and probably elsewhere.

WONDERFUL SKILL is exhibited in the work of Stebbins' gig saw, exhibited by Geo. A. Day. We saw an ornamental piece cut out last night, which was a marvel for sawed work.

Varney's Amalgamating Pan.

This invention has proved its great worth and importance to the mining interests on this coast, by the high and permanent standing it has attained among millmen and metallurgists in almost every section of vein mining in the Pacific States and Territories.

Previous to 1861, pans were very little used for working ores. Such as were used, revolved from twelve to fifteen times a minute, and worked from one hundred to one hundred and fifty pounds at a charge. Of course, a large number were necessary to do the amalgamating for an ordinary mill.

It was possible to construct pans, as made at that time, of larger size, but it was not possible to run them faster, and thereby do more work with the same pan.

In 1861, Thomas Varney, of this city, invented an amalgamating pan and patented it in 1862.

This invention consisted of a pan of any size desired, with hard iron dies fastened to its bottom, forming the lower grinding surface. Above this revolved a circular iron disk or plate, to the lower side of which were fastened hard iron shoes, which formed the upper grinding surface. Through the center of this revolving plate or muller, was a large opening. Above this revolving muller, extending from the periphery towards the center of the pan, were stationary curved plates. The pan being filled, and the muller revolved, the pulp passes down through the center opening, is thrown to the periphery of the pan, prssos up around the ontside, against the curved plates, and is again by them conveyed back to the center—thus the revolving muller at once causes the ore below to pass from the center to the periphery, and above from the periphery to the center, thereby causing the pulp to flow in a constant stream between the grinding surfaces, and however rapid the muller may revolve, the pulp cannot be thrown out of the pan.

This invention at once enabled miners to accomplish as much with one pan as they formerly did with a dozen.

Its importance will be understood when it is considered that probably not less than one million dollars' worth of pans, on this prineiple, have been manufactured in this State.

Since the above invention not less than fifty diffcrent kinds of pans have been tried in this country. It would be safe to say that nineteen-twentieths of all the pans running on the Pacific Coast to-day are constructed on the prineiple of Mr. Varney's original pan. The inventor has made the amalgamating pan his special study during the last nine years, and he has made many important improvements in his pan. One of the most important is making radiant slots in the lower dies and filling them with wood so as to grind on its end. This wood is worn by the quartz a little in advanee of or below the surface of this iron, thus causing slight depressions. These being made by the ore, their depth depends on the eoarseness of the same. Of eourse they are constant and self-regulating.

This device more than doubles the grinding capacity of the pan.

Mr. Varney exhibits his most improved pan in the Fair, in whieh may be seen the above improvement as well as the following: The frame on which the pan rests is east in one piece. The driving shaft lies on this frame, passing through the center, leaving nothing to be adjusted in the mill. The driving pulley can be placed on either side of the pan, to suit the mill. The pan can bo sot on the legs either side to, as desired. The gear on the vertical shaft lies ou an adjustable stand, and ean be raised or lowered in a moment. The vertical shaft has a loose sleeve on its upper bearing, whieh always holds it in the center, and prevents wear. All the eenter bearings are oiled by pouring oil in tho top of the vertical shaft. The shoes on the mullers, and the dics in the pan, are fastened with wooden wedges, requiring no bolts or rivcts; and when fastened in they are necessarily made of exactly the same diameter. There is a changeable lining extendiug up some six inches from the bottom, preventing all wear on the insido of the pan. The curved plates are arranged in a new and simple manner. The pan works anywhere from five to eighteeu hundred pounds at a bateh.

Mr. Varney's laboratory is located at No. 229 Fremont street, adjoining Hanscom & Co's Ætna Iron Works, where persons interested can at all times examine this pan in all its parts, in connection with other erushing and metallurgieal machinery.

NEW TIN REGION.—A despatch from Los Angeles, dated Oct. 22d, announces the discovery of new tin deposits in the Coast Range in that county, near Elizabeth lake, 60 miles from Los Angeles city. A ledge 12 feet wide is said to assay one-fifth tin.

THE California Building and Loan Society which Thomas Mooney is President, has been liberal with the honest laboring money-savers, and is now doing a thriving business.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Leviathan.—*Miner*, Oct. 16th: Lumber is coming in over a good road just built, more men are being set at work, a large honse is going up, and it is said the furnaces, engine and other machinery for smelting works, are soon expected.

Imperial Quarries.—*Chronicle*, 16th: This company, up to Monday last, had made 1,200 feet of tnunel, and was within 360 feet of the perpendicular of the Florence lode. There is no claim in this country more promising.

CALAVERAS COUNTY.

Thorpe's Lode.—A correspondent of the S. F. *Times* writes from San Andreas: Thorpe's qnartz lode, half a mile south of Fourth Crossing, is remarkable for the width of its gold-bearing ore, being nearly a hundred feet between walls. The gold is of great fineness, assaying .930. The extraction of rock for the arastras is of the easiest kind, there being an inexhaustible body at hand. The depth reached is 50 feet, and the rock extracted has yielded ten dollars a ton.

Quartz.—*Chronicle*, 23d: Hopper & Chapman have their new hoisting works in operation; they are sinking their shaft, working day and night; the rock is richer than any previously taken out....Gay, Sanderson & Co. have attained a depth of 130 feet, and have had very rich rock from the top down....Lewis & Co. continue to roll out the metal....At the Palomo, they still ou their main shaft. The mill of 16 stamps is rnnning night and day....Alexander & Co., adjoining, are working with their usual cnergy. Their mill is in constant operation.

Gravel.—Harkins & Co. have made another cleaning up of nearly 400 ounces. ....The Coffee Mill is taking ont 200 car loads a day....Paul & Co. are running drifts and opening up ground for future operations.

Shaw is still piping away at his bank, and his drafts on it have never been protested.

INYO COUNTY.

Cerro Gordo.—Los Angeles *News*, 16th: A correspondent says: "This camp is flourishing. Plenty of rich silver and galena ores are being taken out, and rich developments are being made every day."

Specimen.—A friend sends a 30-pound specimen of argentiferous galena from the San Lucas mine, Cerro Gordo. The vein shows six inches in thickness, and the entire mass of ore is very rich in silver.

NEVADA COUNTY.

Eureka.—Grass Valley *Union*, Oct. 20th: The Eureka mill was yesterday cleaned up, after a two weeks' run, and the proceeds sent below. The amount realized was something over $20,300, not counting snlphurets.

North Star.—*National*, 25th: We nnderstand that this mine had a clean up Saturday, amonnting to several thousand dollars. Taking out rock will be suspended for the next eight or ten days—to put in a new 16-inch pump, and an engine.

Pittsburg.—Same of 26th: The rock still looks first-rate. We saw a small specimen which was streaked with fine gold and rich in sulphurets.

PLACER COUNTY.

Evening Star.—Auburn *Herald*, 23d: Wm. Quick, one of the owners of this mine brought to this office a piece of blue quartz, or yellow gold (there is some doubt which predominates, the gold or quartz) which weighed nine pounds, avoirdupois, and excels anything ever seen in this county for beauty and richness. This nugget was taken from the bottom of a 60-ft. shaft, and bears every indication of coming from below water level. We learn that they have another specimen almost as rich, at the mouth of the shaft, that it takes a good man to lift. This claim has paid from the top down, ranging, on the mill rock, from $50 to $250 to the ton.

PLUMAS COUNTY.

Good Prospects.—Quincy *National*, 16th: We are informed that Hand & Lothrop, who, for some months past have been running a tunnel at the foot of Hungarian Gulch, have struck "pay grit" lately.

Saw Pit.—The miners are all taking ont pay dirt. Most of the claims are looking well. The companies have completed their arrangements for the winter's work. None of them expect any water to wash up with before spring.

North Fork.—Correspondence of same: Boston & Bryan have got the river turned through their race, and will begin taking out money in a few days. This is one of the heaviest mining operations on the North Fork. The Dutch Hill Co. are doing very well. Ferguson & Wagner are preparing to bring a ditch of water on their claims (the old Cnmmings claims). Mechlin is digging a ditch to bring water on part of his claims on Barker Hill. He has ground that prospects well.

SISKIYOU COUNTY.

Good Prospects.—Yreka *Union*, 16th: The Scott Valley Qnartz Co. have got down 40 ft. on their ledge. At that depth it is from a foot to twenty inches in thickness. Mr. Sheppard, who is erecting a mill, has shown us specimens. Through the ledge there are seams of rotten quartz, perhaps an inch or two in thickness, which are completely impregnated with gold. In addition to this, the solid qnartz shows a great quantity of gold.

Paying Well.—S. S. Richardson, who brought the waters of Elk Creek on to some high bars on the Klamath just above Happy Camp, informs us that his claims are paying first rate.

TRINITY COUNTY.

Indian Creek.—*Journal*, 23d: Stoddard, Silcox & Conmbes are working the creek from bank to bank, and making it pay well. ....R. Silcox has purchased the Attinger ditch, and intends to mine this winter.

Douglas City.—Marshall & Mason's claim on Union Hill, from which so much money has been taken, is being put in readiness for water.

Martinsville.—Two miles below Gray's store, Thompson & White are constructing a ditch from a small creek to the bars at Horseshoe Bend. On one of those high bars, Mr. White, last winter, with the aid of the seepage water of some springs caught in a reservoir, washed out $400. The gold in those high bars is very fine all through the bank from the surface down. On the low bars and in the river bed the gold is coarse and can be saved in a rocker. Bonteeou is at work *a la* Chinaman, putting in the time until the season arrives. From $1.25 to $3.50 per day is the result.

Alaska.

Gold Discovery.—Sitka *Times*, Sept. 4th; Great excitement was created last Tuesday by the arrival of an Indian from the Tacoo country, who brought gold taken from a river that empties into Awk Bay 90 miles northwest from Sitka. The gold is of rich quality. Immediately after the discovery was made kuown, our citizeus engaged a few men to go out and prospect, taking along the Indian, and yesterday the party started by the Revenue Cutter, Lincoln. The Indian worked three hours, and took out from $1 to $1.25. This we consider very good pay in panning out with a shovel. Geu. Thomas has taken the specimens to San Francisco.

The same of Sept. 25th, says the party had returned. Besides the creek pointed out by the Indian, they found five other streams emptying near together, and gold in all of them; but the richest deposit was found four or five miles up the main stream at the foot of a fall of some hundred feet. They are confident that with proper mining implements, they can make twenty dollars a day. They commenced panning out and averaged twenty cents to the pan; but as soon as the Indians saw they were keeping the little particles found in the sand, they became troublesome, threw down the sand as fast as they shoveled it up, took away their ammunition, some of their provisions, and stripped one of the party of his clothes. They said they didn't want the Bostons to live there. They ordered the miners away, and threatened to kill them if they did not go. These men are anxious to return, accompanied by an armed party.

Arizona.

Lower Lynx Creek.—Prescott *Miner*, Oct. 9th: Some 25 or 30 miuers are at work in the vicinity of the old Mexican camp, making fair wages. The majority are Mexicans. Last week, some Americans who had just arrived in the country, went over to the creek, and while prospecting, found one piece of gold and quartz which they sold for a $20 greenback.

Wickenburg.—The amount of gold taken out by the Vulture Co. is far greater than people have any idea about, but their expenses have been great, they having to pay big prices for wood, provisions, labor, hauling of ore, etc. Their affairs, however, are now conducted with sharp economy, and their ore is as rich and as plenty as ever. The White Picacho owners are getting ready to work.

British Columbia.

Cariboo and Kootenai.—Victoria news of the 15th is as follows: The mining intelligence from Cariboo and Kootenai is favorable. Water is plenty, and the hydraulic claims are all at work. The claims on Williams creek are paying well. A new quartz ledge has been discovered on Mosquito creek. T. Allen, of the Dutch Bill Company, on Williams creek, met with an accident from a cave in the bank, by which his leg was broken. The Dutch Bill Company cleaned up 173 ounces for four days' run. Since last April the Coombs' claim, in Stout gulch, has yielded $50,000. Weaver creek, Kootenai, is said to be paying from $20 to $30 per day to the hand.

Idaho.

Ida Elmore.—Owyhee *Avalanche*, Oct. 16th: The main shaft is down 340 feet; the ledge continues four feet wide, and the ore is richer if possible than any yet taken from the mine; in the third level where stoping is in progress, the ledge is 2½ feet in width.

Golden Chariot.—A tnnnel is being driven on the fourth level, in both directions, on the ledge from the principal shaft. The width of the ledge has increased, and the ore is very rich.

Poorman.—A two-foot ledge of the best mineral that has been taken out of the mine for two years, was discovered a few days ago, south of the main shaft, in the fourth level, ou which a shaft has been sunk. The vein is wideniug.

Peck & Porter.—The ledge is abont two feet wide, of good paying mineral. They are stoping at a depth of ninety feet; the shaft is sunk thirty feet below this point.

Red Jacket.—The vein will average from ten inches to a foot, exceedingly rich. Drifting is in progress 80 feet from the surface. B tunnel commencing some three or four hundred feet north of the present works will be begun in a few days. This tunnel is to rnn in on the ledge, and strike the perpendicular line of the main shaft 150 feet below.

Allison.—Some of the richest silver ore that has ever been extracted from any mine in camp is now being taken from the drift 150 feet from the surface.

Potosi.—This mine is producing excellent ore. A tunnel on the ledge has progressed several feet, commencing two hundred feet above the shaft house. The ledge averages a foot and a half in width. Mr. Peck intends to continue work during the winter.

Items in *Wave*, 21st: O. H. Purdy showed us two specimens from the Keystone mine the other day that were full of the richest kind of sulphurets of silver, tinged slightly with copper. They came from the bottom of the shaft.

W. H. Clark has taken a contract to get out five hundred tons of Twilight ore in Flint. The work will involve the running of an 80 foot tunnel.

Loon Creek Mines.—*Statesman*, Oct. 19th: Mr. John Grande arrived yesterday from Oro Grande. He was one of those who went to Yellow Jacket, and he confesses to getting badly stung. The gold is very scarce, but the broken down mules are plenty. At Loon Creek everything is doing well. Many claims considered of little account are proving good. For instance, claim No. 61 below has developed four feet of pay gravel.

The *New Northwest* gives some extracts from a private letter dated September 22d, which it declares reliable. We qnote: "The claims now opened have averaged just three ounces per day to the hand, and some are paying far better than that. Jim Forrester took out a nugget last week that weighed $125.60, and a number of pieces have been obtained weighing $20, $40 and $50. The gold is coarse, and of good quality, assaying from $17.73 and $18.10, and passes at $18: The diggings, so far, have been confined between two cañons. The distance between is nearly two miles, with bars on each side. Last week a prospect was obtained at the head of the lower cañon of $5 to ten pans, and no bed rock.

Montana.

Phillipsburg correspondence of Helena *Gazette*, 14th: At Georgetown the Pittsburg and Wheeling companies are still idle. In fact, no enterprise is exhibited except by Camerou, on the Thomas lode, and the Mechanics' tunnel. Both parties have nerve, and are bound to win. At home we are taking out rock in case any stray mill should come along. The Saunders Company are hiring men for operations on the "Speckled Trout." They have a nondescript, with which they intend to separate the metal, preparatory to shipping East for refining. They intend to get up steam about the first of December.

Highland.—Letters to same from Red Mountain: The rich strike on No. 28 below in the main gulch proves to be a regular streak, and $798 to the set of 8-foot timbers is not above an average. There are four bedrock flumes to bedrock in Highland gulch and its tributaries. The Red Mountain Bedrock Flume Co., a mile and a half below Red Mountain City, has suspended operations for the season on account of the scarcity of water. This Company has a thousand feet of 20-inch flume, and owns over 3,000 feet of ground. Prof. Swallow's mill is rnnning upon ore from the Only Chance lode, and negotiations are pending for the purchase of 600 feet of the property by the Highland Gold Co., including discovery. This lode is developed to a depth of 200 feet, with a tunnel 345 feet long, striking the vein at a depth of 112 feet, and a shaft 87 feet below the adit level. At this depth the lode shows increased richness.

Snowshoe Diggings.—*New Northwest*, 15th: E. W. Pryor and Rufus Johnson, of Snowshoe, near Blackfoot, have 7,000 linear feet of bar and gulch ground, own the ditches and water right, and are working two hydraulics, two ground sluices and a bedrock flume, employing 14 men and using 500 inches of water. The product per week averages close to $2,000 gold. The bar, at the flume, is about 80 feet high, 35 of which is a soft bedrock, readily sluiced off, exposing a 30 foot bed of granite, paying from 10 cents to $1 to the pan. The width of the pay streak is unknown, a tunnel now going in has shown it to be at least 130 feet wide.

Nevada.

COPE DISTRICT.

Mountain City.—Elko *Independent*, 20th: We have seen several parties, this week, direct from Mountain City, and all bring good reports. Where work has been done on any of the ledges, they continue to improve. The Drew & Atchison mill will soon be ready for work. McDonald, the assayer, is kept busy in testing ore from the many new discoveries constantly made.

The same of 23d has a letter, from which we quote: "Since my last, many valuable ledges have been discovered. Sufficient work has not yet been done to develop their resources. Reports are coming in daily of new discoveries within a distance of twenty miles of this place. D. Krider, who took the contract to deliver the machinery for the Drew & Atchison mill, has safely landed at the mill-site all the heavy machinery. Uncle Johnny is straining every nerve to prepare the mill for work by the 1st of December. Rumor has it that a 5-stamp mill is on the way here from Chicago. We will keep all the mills busy that may be erected. The Porter Co. has selected a quantity of first-class rock for shipment to San Francisco. I have just visited the Hamilton mine, and have seen some of the richest rock yet found in this district."

MINERAL HILL DISTRICT.

Character of the District.—Elko *Independent*, Oct. 23d: The general formation of the country resembles that of Treasure Hill, while the ore bears a striking similarity. Vast deposits and irregular belts of wonderfully rich ore traverse the hill in all directions. But little work has been done in the way of obtaining depth, although in every instance where the veins have been sunk upon, regularity of dip and casing has been encountered, with a superior quality of ore. Fifty tons of ore worked at Austin, $23,000. The ore generally requires roasting. Spence & Co. have 200 tons of ore of superior quality on the dump. The hills are covered with thick timber. It is now settled that at least one mill will be put up before snow flies. The cost of hauling ore to Austin and having it worked foots up $75 per ton, while it can be delivered in San Francisco at a cost of $55.

Railroad District.—A discovery of a galena vein has been made by Frank & Armstrong, from which three tons of almost pure metal were taken out by two men in three hours, containing about $200 to the ton in silver. The facilities for smelting in this district are of the best. Wood in the vicinity is abundant.

REESE RIVER.

Manhattan.—*Reveille*, 15th: As was supposed by many, the purpose of the telegram on the 13th from President of this company, was to bring about a reduction of wages. A proposition to work for $3.50 instead of $4, as heretofore, was made to the miners. Some accepted, and were set to work. Others will leave for Virginia and California....The same of the 20th says: The Manhattan mill will be closed to-day for necessary repairs. It will be reöpened about the 1st of November, and will continue in operation during the winter.

New Style.—The name of the company which has succeeded the Twin River Co. in Ophir Cañon, is the Cambridge. We learn

that explorations will he pnshed in the Murphy mine of that company.

YANKEE BLADE.—Same of 20th: The strike of rich ore in the Yankee Blade mine of the American Co. last week, is important. The working is through a vertical shaft, now 300 ft. deep. At this depth a level was begun, intended to reach a well-known chimney in the mine; and in the slight length of 30 ft. the edge of the body of ore was cut.

WASHOE.

SIERRA NEVADA.—Gold Hill *News*, Oct. 23d: The drift has opened the ledge 63 feet, and the face shows the same rich ore continuing towards the northeast. Its width is not ascertained, hut it is over ten feet. The drift is now being timbered. The orc is soft and fine, easily picked down and shoveled, and car samples from it assayed from $100 to $160 to the ton; thirty two tons of it run through the mill yielded $4,200. It looks like silver ore, yet it yields principally froe gold. Independent of the new strike below the car track level, there is ore enough developed in the surface workings to keep up the present monthly dividends for a year.

OCCIDENTAL.—The face of the lower tunnel shows considerable improvement within the last few days. The winze from the 600-oot level of the old mine is 327 feet deep, and is in excellent pay ore all the way.

OPHIR.—The pump-rod broke on Thursday and fell to the hottom of the shaft. The necessary repairs will occupy several days.

HALE & NORCROSS.—Present yield 180 tons per day. The sinking of the main shaft is discontinued. It is 1,150 feet deep. A small streak of good ore a foot wide is encountered.

IMPERIAL-EMPIRE.—The cave and filling up of this shaft to above the 1,100-foot station, set back the work over four months. The shaft ia now cleaned out and repaired to within twenty feet of the hottom. Sinking will he reaumed in a week. The old upper levels yield 45 tons of ore per day. The receipts for Septomher aggregated $14,-636,09. No oro is being oxtracted.

LADY BRYAN.—The new mill is steadily running, and the month's receipts are expected to he hetter than ueual.

SAVAGE.—The yicld is not heavy; 380 tons of ore worked last week yielded $16 per ton, incurring a loss of $5,099.

GOULD & CURNY.—Ahout 40 tons of ore, assaying $40 per ton, is the daily yield, principally from the old uorth mine.

CHOLLAR-POTOSI.—The yield is about 125 tons per day. The hnildings over the new shaft is completed, and the enginc will be ready for hoisting inside of two weeks.

YELLOW JACKET.—The face of the north drift at the 900-foot level shows considerahle improvement.

VIRGINIA CONSOLIDATED.—New shaft 367 feet deep, and progressing at a satisfactory rate.

KENTUCK.—Ahont 125 tons per day is the present yicld, all from ahove the 800-foot level.

DANEY.—*Enterprise*, 24th: The new hoisting works are completed and the old shaft has been cleared of dirt, charred timhers, etc., and retimhered to the depth of 240 feet.

TAILINGS.—The piles of tailings in Gold Cañon might be measured by acres. They pay $5 to $8 per ton for working. The Birdsall Mill Co. own au immense lot of them, and run through 200 tons per day. They havo a substantial car track from their main reservoir to their mill.

WHITE PINE.

WEEKLY MINING REVIEW.—*Empire*, Oct. 24th: The general indications continue to be of the most favorable character, and the amount of ore being brought to the surface is steadily increasing. Mines which have contracts with the mills are generally shipping larger quantities of ore than usual, with a view to getting in the winter supply whilo the roads continue good. A few moro teams would find profitable employment during the next two months. The great payiug mines of Treasure Hill never looked so well or gave so much evidence of pcrmauence as at the prcsent time. The developments in the Eclipse Consolidated have cstablished the existence of a succession of horizoutal strata or deposits of paying oro on the Flats, whilc tho explorations of the Aurora and other mines have proven the existence of an immeuse vertical ore channel.

BULLION.—*Empire*, 24th: Our hullion shipments for the past week aggregate hut $48,790.14. The falling off is perhaps due to the fact that in the rush to supply the mills hefore winter shuts down, the ore has not beeu so carefully assorted.

The *News* makes the hullion shipment for the week $35,561.54.

MILLS AND FURNACES.—*News*, 23d: The Swansea mill, owned hy Perkins, Flint & Co., of San Francisco, is uow in full hlast. Taken as a whole, it is one of the hest of its size in the District. There is one rock-breaker, Blake's No. 3; two hatteries of five stamps, 750 pounds each; 8 tanks for receiving pulp, 11 by 5 feet and 3 feet deep; 7 Varney pans, and two 7-feet settlers, with agitators to match. Estimated working capacity of mill, 20 tons per day. The hoiler is 16 feet in length, and consists of 42 3-inch tuhes. The engine is of 45-horse power. The mill is running on a contract of 500 tons of ore from the Aurora Consolidated. The price we understand to he $20 per ton. The *Empire* says the property is valued at $60,000; and that it is capahle of clearing $2,000 per week, running on custom rock....The Stanford mill went into operation on the 20th....First hrick from O'Neil & Co's new draft furnace was shown the *Empire* on the 18th. The capacity of the furnace is six tons per day. ....McCoy's smelting furnace, in Eureka, has a capacity of five tons per day. The ore yields 75 per cent. of metal, worth in San Francisco $320 per ton.

ITEMS.—*News:* Aurora Consoldated sends 75 tons of ore to mill per day....Addington's first-class ore yields $221; eecond class, $80 per ton....The Autumn cut in Aurora South, is turning out very rich ore. ....Burning Moscow has struck $150 ore at 30 ft....Consolidated Chloride Flat is yielding 64 tons ore per day. A body of rich ore was tapped on Thursday.... Eclipse Consolidated struck a body of $1,000 ore on Wednesday....Eberhardt takes out 16 tons daily from the surface cut. The Defiance shaft in this claim is to he sunk to the depth of 500 ft. This will prospect the mine thoroughly....Hidden Treasure sends 30 tons to mill daily.... Treasure Hill M. & M. Co. eends 60 tons to Big Smoky mill daily....Wilcox has enspended operations during pending negotiations for its sale in Chicago....Linsley and others have sold several claims to the Great Basin Mining Co. of Philadelphia, for $120,000....Assays of ore from new claims on Bahylon Hill arc from $347 to $620....Bradshaw got a one-pound hrick from two pounds of hase metal ore hrought him the other day hy a miner who wanted to give half his claim for instructions how to reduce the ore. It was worth $320 in silver per ton of metal....The *Reveille* learns hy letter that a lot of White Pine lead hullion, refined in San Francisco, yielded only from $10 to $25 per ton.

OUTSIDE DISTRICTS.—*Empire:* Things in Spring Valley reported flourishing.... Splendid samples of chloride are shown us from the Post Boy in Pinto; assays as high as $400 per ton. A ten-stamp mill was going up at once for the Pinto Consolidated Co.... Mr. McMurray had 2 tons of Tem Piute ore, from the Inca and Demarara ledges, worked at Ben Evans 10-stamp mill in Hyko. Thc result was $578 per ton..... Mines in Kern District idle—making preparations for winter.....Mr. Barnes writes from Springville, in Shoshone District, October 16th: About twenty-five miles east of Springville some of the richest mines yet known, are said to have heen discovered. Hundreds have gone there, aud every one who returns is very much elated. Many pieces of rock have heen assayed here, which range from $200 to $3,000 per ton. One ledge, across the hase of the mountain, something over six feet thick, crops out holdly to the hight of thirty or forty feet. The range hearing mineral rock is some three miles in length. The excitement runs high here.

New Mexico.

THE PROSPECTS.—Elizabeth *Telegraph*, Oct. 2d: We have a large area of ground that will pay from six to twenty dollars a day to the hand. Seven hundred inches of water will hc brought in through the large ditch, already completed, at such a height as to enable miners to use the same water six or eight times, or even oftener. Quartz lodes are not yet sufficiently developed, though many are known to be good. The only mill in operation—Maxwell's, on the Aztec lode, fiftcen stamps—cleans up from five to seven thousaud dollars every week. The discoveries recently made on Red River, eight or niue miles from here, indicate a mining field second to none ou the line of the Rocky Mountains.

Oregon.

ORO GRANDE.—*Sentinel*, Oct. 16th: This company has struck a quartz lead in Applegate, Josephine County, that prospects well in free gold. We have some of the rock at our office, which looks rich. The vein is 12 feet wide betweeu casings.

Mining, Metallurgy, and Lawing at White Pine.

[Written for the Mining and Scientific Press.]

EDITORS PRESS:—I had intended writing to you sooner than this, hut the various combinations have changed so fast that I have really feared to do so, as I must have made many statements that were, to say the least, incorrect, or would he so hy the time they would appear in print.

LAW AND TITLES.

First, the suit then pending between the Original Hidden Treasure and Rathhurn, changed daily, I might say hourly—first one side, then the other, having the best of it; and finally after the Rathhurn had won the case, the fight, hy a *coupe du main*, was opened afresh, and tho Hidden Treasure folks, finding they could not gain, examined witness after witness, thus hoping to gain time to the close of the session or term, and wound up hy compromising, or paying the whole cost of the suit, with the hope of a final compromise, and leaving their case in this position to this date. Next, the Pogonip & Othello tried to retain counsel equal to the occasion for a pittance, and failing in this, employed third class lawyers, and lost their case in consequence. Then the varied and various manipulations of the Consolidated Chloride Flat Co., *vs.* all who held a claim to any portion of the Chloride Flat, and their attempting to carry their claim through on friendship; close on the heels of which comes the failure of the First National Bank, and every miner in the country loosing his earnings.

STATE OF THINGS—THE TOM PAINE AND EAST SHEBOYGAN.

It is almost impossihle to write a letter which will convey to the general reader an idea of the husiness as it stands in White Pine to-day. Our mines improve with each day's developments. The Tom Paine was honded to Messrs. Walker & Pierce, of Chicago, for $12,000, currency; is held to-day at $75,000, coin, and has produced more hullion than the original figures since it was honded. The Earl, sold about the time of my last, has returned to its purchasers fully the amount paid for it. East Sheboygan, which was, at that time, offered for a few hundred dollars, has made a vast improvement. Let me give you a little description of this latter mine: The owners first discovered that Treasure Peak was a "vast upheaval of slate," with a limestone surrounding, and hetween the two formations the rich and celehrated Hidden Treasure occurs. Acting on this, the owners located East Shehoygan, having disposed of the Original Sheboygan to the Mammoth Company. A shaft was sunk on the line, and at a depth of 24 feet tapped the ledge. Ahout that time Judge Bates, of Chicago, arrived here, and having carefully examined the mine, took its stock home with him for sale to his friends, hut failed to dispose of it. The Mammoth Company at this time were extracting very rich ore, and the owners of the East Shehoygan, not being allowed in the Mammoth works, commenced a tunnel helow the vein, with a view of tapping their shaft. This tunuel met the vein at a depth of only 18 feet, and in a few feet more were astonished hy hreaking into a large chamher, where they found the Mammoth at work extracting this rich ore. A chamher 60x30 feet had heen worked out. The vein is fully 14 feet wide, and the linee having heen defined hetween the two companies, they have now undisputed possession of 1,000 feot of the richest ground on Treasure Hill. In consideration of the ore extracted hy the Mammoth, they offer to give up some 75 tons of second class ore lying on their dump, hut I presume this point must hc decided hy the Courts. The Tom Paine having passed into the hands of Geo. H. Willard and Johu A. Paxton, is being devcloped very fast. A chamber 18 feet high, ahout 11 hy 12 feet, with a drift eight feet loug hy 10 wide, has been excavated into the hill, exposing a foot wall as clear and emooth as that of the Eberhardt, having a general southeast and northwest course. Several other openings have been made, and ore now appears on three levels. From four to five tons of milling ore are heing taken out daily, and a road connecting with the O'Neal grade has heen huilt, all expenses being covered hy returns from the mill.

METALLURGY AND BULLION PRODUCT.

The Aurora Consolidated Company are sending about sixty tons of *low grade* ore to mill daily. Treasure Hill M. & S. M. Co. do ahout the same except that their ore is higher grade, yielding about $80 per ton. South Aurora has commenced to ship their ore to the Stanford mill. I presume this mill will start up hy the first, as they have entered into a contract with the W. P. Water Co., for a supply of fluid. The water runs on Treasure Hill, and we are happy. Smelting furnaces are heing constructed in nearly every cañon in the Base Range, and a Chicago party have lately purchased two of these to experiment with, with a view of going largely into the husiness the coming spring. Our mills are increasing in numhers, hut as yet they do not aupply the demand, and it is almost impossible to get a emall lot crushed without waiting from five to six weeks. I look for a number of Eastern mills here early in the spring, and for milling to he reduced from $20 to $14 per ton. Very little assorting is done even now, as no ore can he fonnd having any silver in it which will not pay for milling. We contrive to ship ahout $300,000 monthly. G. B. E.

Treasure City, Oct. 18th, 1869.

Is the Mechanics' Institute a Local Institution?

Memhers of the Mechanics' Institute, and exhihitore of California products in general, are prohably not aware of the effect of the very ordinary-reading, and to them empty repetition of the word "California," in the Managers' circular on the suhject of premiums. From heing a Fair of the Industry of the Pacific States, American and foreign, the reading of this paragraph,—and the fact hrought to our attention that even the most important and meritorious original exhihitions or inventions hrought to the Fair hy any other than a *local* Californian, can or will he rewarded with a premium—makes us tumhle, in our owu, from the importance of a National Industrial Exposition, to that of one of the State Agricultural Societies. In point of fact, however, our Exposition is national, and international. Nevada, Oregon, Hawaii, Mexico and China contrihute. British Columhia alone has not heen heard from. But as the money that is expended for premiums is taken out of the proceeds of the Fair itself, it is certainly in the interest of California, and of San Francisco especially, that we provide effectually hereafter against this narrow construction and perception of the field of usefulness of the Mechanics' Institute of San Francisco.

SPAULDING VS. TUCKER SAW TEETH.—The trial of this cause during the week has attracted a good deal of attention, heing an action hrought for an alleged infringement of plaintiff's patent right for inserting movable teeth having curved lines in contact with the plate in circular saws. Tho jury rendered a verdict sustaining the allegations in plaintiff's complaint, and awarded plaintiff $1,000 damages. Messrs. J. B. Felton, Alfred Rix and M. A. Wheaton were counsel for plaintiff, and Messrs. McAllister and Bergin for defendants.

CEREMONIAL AND COMMERCIAL OPENING OF THE SUEZ CANAL.—The ceremonies of the opening of the Suez Canal will begin at Port Said on Novemher 17th. We shall read many letters yet, declaring that the Suez Canal is a failure, since the drifting sands of the surface and the quicksands that will work up from helow, together with the fact that the canal is not even now deep enough for large vessels, will deter commerce from this route perhaps for many years to come.

PRESERVATION OF WHARVES.—The piles that are heing driven into the mud on the new sea wall hetween Washington and Jackson streets, together with about 50,000 feet of the surface plank, have heen treated hy the Rohhins process, with sulphate of copper, hy the Pacific Wood Preserving Company, at their worke on Berry street. The result is insured to he a perfect protectiou from wet aud dry rot ae well as from the toredo.

San Francisco:
Saturday Morning, Oct. 30, 1869.

Notices to Correspondents.

G. P. H.—Your questions are answered in our Illustrated Patent Circular, which is sent free.

T. A. H., Forbestown.—That invitation for discussion is still extended on the freest terms; it was only removed from the head of the column because considered a matter of form, that was scarcely longer necessary because understood. A "fight" on the theories of metalliferous deposits, against positions to which you assume that the Mining and Scientific Press is "commited," would not lead to profitable results; but if you can bring any new facts of your own collecting or observation in the mountains to bear, in brief form, our readers will doubtless derive profit. Touching the age and depth of California valley alluvium, you will find it hard to convince geologists that granite is a modern eruptive rock, or that the quartz found in veins was injected as molten matter.

Novel Stamp Mill.—The "Hotchkiss & Gardner Battery" is a new modification of the stamp mill, manufactured in New York, in which the stamps are described as being worked each by an independent piston, on a crooked crank shaft. A six-stamp mill ordered for White Pine, has six pistons, the power being applied to a pulley the same as in an ordinary battery, with a balance wheel on the other end of the shaft. There is an air chamber in the top of the stamp, by which the force of the blow is to be increased, and the compressed air is claimed to help lift the stamp—so says *Inland Empire*. The pistons are packed with leather packing. Driven by a 15-horse power engine, it will easily acquire a speed of 200 blows per minute for each stamp, and one now running in the East strikes 350 strokes per minute. On the hard copper ores of the East, the machine reduces forty tons per day.

Aricultural Envoy from Japan.—The last steamer from China brings us an experienced agriculturist of Japan, sent over by Eugene Van Reed, Esq., to study what plants can be sent here to profit. He is hunting up rice to make immediate experiments in its cultivation. He brings 4,600 chestnut trees and a bushel of seeds of the same tree, all of which are for sale and distribution.

Prof. Brewer, of the Sheffield Scientific School, returned to New Haven early in September, from his trip to the Rocky Mountains.

What About the Sutro Tunnel?

The balance of public sympathy is in favor of sustaining Mr. Sutro, in his tunnel enterprise; and if it were deemed highly probable that within five years the great work would actually arrive at the stage of completion, the expressions of popular and general sympathy would be in character overwhelming.

This is an odd position that the Sutro tunnel project has finally gotten into: the audacious black knight bravely advancing and swinging his broad-sword in the face of the money lenders of "the Bank," their lieutenants, and a host of stock manipulators, single-handed. Sutro insists that he *will* benefit them by running an adit level, for cheap drainage and cheap delivery and working of ores; but the controlling mine owners are averse to being so benefitted. They cannot possibly put up with it.

Mr. Sutro's intelligent undertaking of the project, his instrumentality in presenting to the public the only valuable printed information we have on the developments, character, richness, and geology of the Comstock lode, his pertinacity, for a number of years, and his systematic procedure, command universal respect. He has now been before the public long enough in, adverse favor from a large portion of the mine owners, to have called forth all the ill-reports that could possibly attach to him. We have heard nothing really unfavorable to him; as a man of integrity, and of solid deed, his reputation is equal to that of the best.

A significant circumstance in this juncture is the fact that the Miners' Union, a live body of men who do the work underground and in the mills, who produce the bullion from the Comstock lode, back Sutro with unqualified favor, and $50,000 coin. The "situation," in the history of the Comstock, is worthy of a Kinglake.

The geology of the Comstock lode, as compared with other silver ore deposits, is peculiar; and the later developments showing a general tendency of the vein to flatten toward the east, in connection with the occurrence of the remarkable horse near the surface, and the upper workings having been stock-works in character, have suggested to some of the mine owners doubts of the continuance of the vein in depth; but to others various hypotheses, one of which is to the effect that possibly the Monte Cristo vein might have closer connection with the Comstock vein than has been hitherto made apparent. Though the geology of the Comstock vein is very interesting, and certainly worthy of closer study, the main point to be guided by is as to the actual existence of economical ore at the greatest depths at present attained. It seems most reasonable to conclude that a vein of such richness in such longitudinal extent near the surface, must be at least good at the depth of from 2,000 to 3,000 feet. Parallel veins of more or less promise in the Flowery District, to the eastward, are also expected to be tapped, as a source of speculative profit by the Sutro Company.

The tunnel appears to be well warranted by the promise. The ground is most favorable for that method of working; since by tunneling 22,000 feet we get down 2,000 feet (the depth of some of the deeper mines), and make it possible to get down 1,000 feet further without great disadvantage—availing ourselves of the waters from the upper levels to drive machinery and pumps below the adit level. The deepest vein mining now carried on in the world—at the Samson mine in the Harz—is 3,000 feet from the surface. Were this tunnel completed the Comstock might be worked to a depth of 4,000 feet as easily.

We are told there is not much water in the depths of the Comstock to drain; its disappearance after descending from the upper levels suggesting crevices and faults or slides to a certain depth, in the country rock. Then the matter is chiefly one of raising and transporting the ore to the reduction works. The Virginia and Truckee Railroad Company will have something to put in, on this score.

The probabilities are that if the Comstock lode prove worth working at all below 2,000 feet, the tunnel will have to be opened by and bye. Nothing but good to the entire section can come from the completion of the tunnel, though the Sutro Company should become as great a monopoly in "controlling" the mines—at $2 for every ton of ore delivered,—as the "Bank crowd" are said to be now. Probability number two is, that unless the Miners' Union show much energy in supporting the tunnel project, it will lag, some day, in its weary progress, and both the tunnel and the mines then be controlled by a single incorporation or an equivalent combination. But if the ore deposits below prove treacherous and irregular or uncertain, the V. and T. R. R. may answer the purposes of delivery for all time. We vote for both.

New Gas Apparatus.—Quite a number of gentlemen were present yesterday afternoon, at the store of L. B. Brant, 303 Battery street, to witness an exhibition of a new mode of producing light from carburreted air. The principle is applicable alike to a single and movable lamp, or to any number of burners connected with a gasometer, in the ordinary manner. It consists simply in passing common air through any fibrous substance, which has been slightly saturated with gasoline. Where a single lamp is employed, the globe in which the burning fluid is usually placed is in this case filled with the saturated material, through which common air is forced by means of a blower driven by clock work, placed in the lower portion of the lamp. The apparatus is extremely simple, inexpensive, and free from danger. The lamp while burning, may be placed upon its side upon a table, or the floor, and rolled with perfect safety, and without extinguishing the light. Apparatus sufficient for 75 or 100 burners need not occupy more than five or six cubic feet of space, and can be made ornamental if desired, so as to be placed in a front hall as an ornamental piece of furniture. The gas is manufactured only as used. This is an Eastern invention, and a company has been organized for its introduction into use on this coast. The cost of this mode of illumination is but a mere fraction of that in ordinary use. The company is willing to guarantee that it will not exceed one-tenth that of ordinary coal gas.

A Valuable Book for Mechanics.—Dewey & Co., publishers of the M. & S. Press, have just issued a neat little volume of over five hundred well-executed wood cuts of the principal mechanical movements known. These useful representations of the various appliances of power, are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough at $1 for every farm, shop, and factory.

Next Week we shall resume our Farming and Gardening and other departments, which have been left out of the Press during the Fair. Our agricultural and mechanical subscribers have received a large amount of interesting reading matter in the Fair reports.

Coming Back.—The Nevada *Gazette* says that several of the citizens of that county who recently went down to the southern counties to look into the chances of agriculture and horticulture there, have returned, satisfied that they can do better around their old homes.

Taxation of Mining Claims.—An able article on this important subject from Lewis Chalmers, will be found on another page.

The Saw-Tooth Controversy.

A patent trial of more than usual importance has just terminated in the U. S. Circuit Court, now in session in this city, before Judge Deady presiding.

In order to a better understanding of the points involved and decided, as well as because it is a matter of public interest, we propose to give a brief history of the main subject in dispute, viz:

Inserted Saw Teeth.

Prior to about thirty years ago saw-teeth had been universally formed from the plate and made to cut the requisite thickness of kerf by setting the teeth—that is, bending them laterally, one-half one way and one-half the other. At that time false or inserted teeth came into use. Their advantages are numerous and marked. They need no set, as they are made of such width at the point as to cut the desired thickness of kerf. The natural tooth must of necessity be of the same material and have the same temper as the body of the plate, while the artificial one allows the plate and tooth to be of such different material and temper as their different uses require.

The old method required the teeth to be filed, and the plate gummed, resulting in diminishing the size of the saw and great loss of time and files, while the new method allows the tooth to be removed from the saw, its point drawn at the forge, and when worn out to be replaced at trifling expense, thus saving time, tools and the plate. In case of accident to one or more solid teeth, the saw was ruined or reduced in size, while the loss of artificial teeth can be remedied in a few minutes by inserting others. Besides, the inserted tooth saw cuts easier and smoother than the old, the same power giving from one-fourth to one-third more lumber. These and other advantages soon brought inserted teeth into notice and use in various parts of the country, and their insertion into old and new plates, and the supply of extra teeth became a branch of the saw business.

The Old Mode of Insertion and Its Result.

The old mode was to insert the tooth into a square recess or socket in the periphery of the plate.

The corners of these sockets were rectangular. The tooth was kept in place by a V-tongue and groove about the edges of the tooth and socket.

The use of this angular socket resulted in the frequent cracking of the plate at one or both of the corners, especially at the rear one.

This proved a serious drawback. It affected the use of inserted teeth to a very considerable extent, and threatened their final condemnation.

But their other advantages were so positive and many that every effort was made to save them by finding some remedy for this one evil.

The plate was modified in thickness, strain and temper, and the socket was patched, enlarged and otherwise varied, but all to no purpose.

Thus the evil stood for twenty years, presenting to thousands of skilled mechanics and inventors in hold relief the problem of its remedy.

Spaulding's Invention.

In the fall of 1859, Spaulding, in experimenting at Sacramento, discovered that the desired result could be obtained by *forming the socket on curved lines.* For this invention he was granted a patent, and soon came to this city, and set up the business of manufacturing, inserting and selling saw teeth, according to his improved method.

That business has gradually developed into one of great importance. Almost every mill on this coast now uses his tooth either as made by him or others who are infringing upon his patent.

So effectually does the Spaulding device protect the plate, that of the tens of thousands of his tooth already used, not one has ever been known to crack the plate. Many saws have been run against iron and stones imbedded in the log, and every tooth doubled up, broke off and stripped from the periphery without leaving the least crack, check or injury to the plate. A specimen of a five-foot saw thus mutilated was exhibited on the trial to the admiration and astonishment of all beholders.

And yet so incredulous were millmen on its first appearance, that Mr. Spaulding was obliged to pledge himself to substitute a saw of the old kind in lieu of his in case of its failure, before he could get the consent of his customers to admit his new style of tooth.

To a casual observer, the effect of the invention is not apparent. Actual use is the only means of making it appreciated.

The peculiar structure of a circular saw, especially the internal strain imparted to its central parts in the process of stiffening it, and the peculiar forces it is required to resist, especially the vibration consequent on obstructions while under high speed, call for correspondingly peculiar safeguards, and herein lies the virtue of Spaulding's invention.

INFRINGEMENT.

Something over a year ago the American Saw Co., of New York, established an agency in this city, and commenced the sale of what Mr. Spaulding claimed as an infringement of his patent.

Spaulding immediately commenced suit against the agent, Wm. Tucker, who was, of course, sustained by his principal.

The case was prepared on both sides with great care and skill, and was fairly and thoroughly tried. Depositions were procured from several experts of the highest standing at the East, and several witnesses were brought from thence and gave in their testimony. During

THE TRIAL

the whole range of law bearing on the case was brought forward and discussed in a masterly manner.

All parties agree in awarding to the presiding Judge the highest commendation for patience, fairness, and ability.

It is an old saying among judges and lawyers, that patent cases involve the very "metaphysics of the law." Comparatively few judges or lawers thoroughly comprehend it. But Judge Deady, either from nature, study, or experience, or from all of them combined, seems to be peculiarly and well qualified to try this class of cases. In his hands what would seem to be complicate, confused and intricate, becomes simple, clear and certain.

The defendant denied the charge of infringement, and set up also that the plaintiff was not the first inventor. To support the latter defense, he offered in evidence a patent, issued to Jonah Newton in 1855, for a rotary disk, with curved cutters bolted to curved arms or projections, but the Court ruled it out, as having no resemblance to the plaintiff's device, on the point in question. The judge held that this machine was a rotary chisel, and not a saw. That the cutters or teeth were not inserted into any recess in the disk or plate—that there could not be any danger of the plate's cracking from any socket, and that there was no point of resemblance between the two machines in the practical art case in issue.

The defendant also offered to show that in almost every art, trade and manufacture, the same principle of rounding corners, putting in fillets, etc., had been practiced from the earliest times and was well known, and was ruled out on the ground that it was so well known as not to require proof.

The Judge ruled, that what was proposed to be proven must be deemed not known to both Court and Jury. But the inference proposed to be drawn therefrom, to wit; that because the plaintiff had made use of an old and well known elementary principle in the structure of his device, that therefore the device itself was old, could not be allowed, and added that the elementary principles of almost all inventions are old—that inventors have a right to put old principles to new uses, and have the resulting devices patented, but cannot have a patent for the mere new use of an old device.

His charge on this point was in these words:

"Now, the idea of the invention of this plaintiff (supposing that he invented this mode of inserting teeth) was the application, it is said, of a well known rule or law of nature, a mechanical property of matter; but it was the application to this particular art, in a manner never applied before, and producing a new and useful result, and it is patentable. Upon that point you will take the law as the Court gives it to you, that it is *patentable*."

The defendant also attempted to show that one of his witnesses had made the invention prior to the plaintiff, but the attempt totally failed.

On the question of infringement the defendant claimed to be not guilty, because of the great difference in the forms of the two kinds of teeth and sockets.

He claimed that the plaintiff's tooth and socket were made with straight sides and bottom, and simply rounded corners, while his were made circular about the entire back. On this point many experts were examined.

From the charge of the Court and the findings of the jury, it was settled that there was no difference in kind, but one of *degree* only; that one was curved more than the other, but that the curve in each served the same purpose, and that therefore the teeth and sockets in both saws were identical, and that the defendant had infringed.

The charge of the Judge on this point was as follows:

"If the defendant's saws or saw plates contain sockets or recesses for the insertion of removable teeth, and such sockets or recesses were formed on circular lines, and for that reason rendered the plates less liable to crack or split, then the defendant's saws contained the plaintiff's alleged invention."

The jury returned a verdict for the plaintiff, and assessed the damages at $1,000.

Of the justness and legal correctness of this verdict we have no doubt, and we congratulate the plaintiff upon the success of his suit.

He has invented one of the most useful of modern improvements, and built up on that invention one of the most important manufacturing interests on this coast.

It has been the misfortune of real inventors that the world contains a class of men known to the patent law as "*pirates*," who are ready to enrich themselves by pilfering the inventions patented to others, and under some slight change of form or construction, which almost all inventions admit of, undertake to hide their plunder. The trial just closed adds another to the long list of examples illustrating the truth of this commentary.

Judge Greer, in deciding a late case, says: "It is usually the case when any valuable discovery is made or any new machine of great utility has been invented, that the attention of the public has been turned to that subject previously, and that many persons have been making researches and experiments. Philosophers and mechanicians may have in some measure anticipated in their speculations the possibility or probability of such discovery or invention; many experiments may have been unsuccessfully tried, coming very near, yet falling short of the desired result. They have produced nothing beneficial. The invention, when perfected, may truly be said to be the culminating point of many experiments, not only by the inventor, but by many others. He may have profited indirectly by the unsuccessful experiments and failures of others, but it gives them no right to claim a share of the honor or the profit of the successful inventor. It is when speculation has been reduced to practice, when experiment has resulted in discovery, and when that discovery has been perfected by patient and continued experiments, when some new compound, art, manufacture, or machine has been thus produced which is useful to the public, that the party making it becomes a public benefactor and entitled to a patent.

"And yet when genius and patient perseverance have at length succeeded, in spite of sneers and scoffs, in perfecting some valuable invention or discovery, how seldom is it followed by reward! Envy robs him of the honor, while speculators, swindlers and pirates rob him of the profits. Every unsuccessful experimenter who did or did not come very near making a discovery now claims it. Every one who can invent an improvement, or vary its form, claims a right to pirate the original discovery. We need not summon Morse, or Blanchard, or Woodworth, to prove that this is the usual history of each great discovery or invention.

Parties who, in the face of this decision, continue to buy, use or sell the same, with teeth inserted either in whole or in part on curved lines, will be entitled to small sympathy if they should be held to a strict accountability.

All such saws, however the circular formation of the sockets may vary in appearance, are held as colorable modifications and evasions of the Spaulding invention, and infringements of his patent

Burgess' Patent Music Folio and Binder.

When we consider the extensive use required for an article like the one here represented, it seems, indeed, singular that some inventive genius has not before supplied a satisfactory article. But all who use sheet music have experienced the want of some convenient device, in which the pieces may be quickly inserted and held in convenient manner for use.

Hubert Burgess, a well known teacher of drawing in this city, we believe to be the first and only inventor who has succeeded in making a music holder which is complete in all its requisites. It is spoken of by musicians as a most perfect music folio and binder, far surpassing any other yet offered for sale.

FIGURE 1.

Our engraving affords a very good view of the folio, partly filled with sheet music, opened and ready for use. The lower half of the sheets on the right side are represented as torn away, showing one of the two clamping bars in which the back of the sheets are held. By loosening the screws (one of which is shown) the clamps spring apart by springs not seen, so that an additional sheet of music can be inserted in any

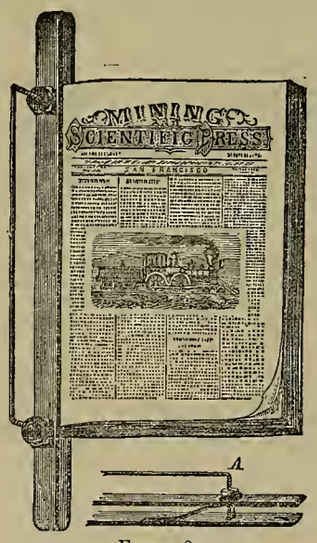

FIGURE 2.

part of the file desired; or any particular piece can be taken out without disturbing the position or changing the order of any others. The screws contain notches on two sides, by which they are turned up tightly by the use of the two-pronged key, one end of which is shown. A slot is cut in the back of the clamps, through which the key is inserted, resting against the cover and keeping it open and rendering the folio rigid while in its position on the music rack. Clamping the sheets in this manner in an open and rigidly held cover, causes the leaves to fold back when open and remain in convenient posture for use (in just about the position shown in the illustration) without any tendency towards closing. The readiness with which leaves may be turned, and the manner in which they naturally rest, is one of the important results accomplished by this invention. When the folio is to be closed, the key is withdrawn from the back and placed in a socket, the lower portion of which reaches just below the torn portion of the leaves shown in our engraving.

This invention affords an ornamental as well as useful and novel article.

The proprietors claim that the music can be placed in the folio quicker, neater and more firmly than in any other holder, and re-adjusted without any danger of tearing or otherwise injuring them.

The principle used in Mr. Burgess' music folio for holding the sheets, is the same as that of his newspaper file holder, in which the spring alluded to above, are shown in part marked A in the following figure, which was fully described in a late issue of our paper. We republish this cut so that the reader may more readily perceive the holding device of figure 1.

The patent for this invention was obtained October 12th, through the MINING AND SCIENTIFIC PRESS Agency. One entire half was assigned previous to its issue to James Stratton. Mr. Burgess has also disposed of his remaining one-half for this coast to Messrs. James A. Pritchard and J. D. Littlefield, of this city. It is their intention to commence manufacturing both the holder and folio for sale, at once. Further information may be had by addressing James Stratton, Oakland, or calling at room two, No. 423 Montgomery street, San Francisco.

Mr. Burgess is also the inventor of a patent pencil sharpener, already in use, and several other things of merit, including his popular system of drawing for public schools.

National System of Drawing.

Upon the wall of the middle room of the art gallery at the Pavilion may be seen a set of engravings published by Hubert Burgess, of this city, developing a somewhat novel system of teaching, what is styled the "National system of drawing," and designed, more especially, for use in common schools. Mr. Burgess has also published a pamphlet of twenty-four pages, setting forth the elements of perspective, and designed to render material assistance to those learning to draw from nature. An examination of this little manual and the accompanying diagrams or drawings, are sufficient to show that the art of drawing is not, after all, so difficult to master as many suppose. The principles upon which it depends are few and simple, and when thoroughly understood, will, with a little experience, soon lead to a practical knowledge of this beautiful and useful art. The "national system" of which the "elements of perspective" form only a part, is the result of many years of experience in teaching. There are numerous incidental advantages derivable from the study of drawing in common schools; among which we may mention, as of chief importance, the cultivation of the eye, and the steadying of the hand, qualifications invaluable for any occupation. Mr. Burgess will give a free lecture upon the principles of drawing at the rooms of the Mechanics' Institute, on Post street, on Thursday evening next, to which the public are invited.

THE MARSH HARVESTER.—Hawley & Co. exhibit at the Pavilion a new competitor for public favor in the shape of a harvester, for which several points of superiority are claimed, among which may be noticed: Light draft, ease of turning, saving from scattering, and in labor, etc. With two horses, a boy to drive, two binders, and one to shock up, it is claimed that this machine will do as much work as can be done with eight men and two to four horses with ordinary hand rakes. By the aid of machinery, the labor and expenses of harvesting have been greatly reduced, and that portion of farm work is no longer looked forward to with the dread and anxiety with which it was once connected. Our farmers will do well to examine this new machine, and judge for themselves of its merits. Messrs. Hawley & Co's warehouse is at the corner of California and Battery streets.

[From the Mechanic' Fair Daily Press, Oct. 23.]

Results of Enterprise and Industry.

In the year 1830, a visitor to the town of St. Johnsbury, Vt., would have remarked it as a picturesque, quiet village of a few hundred inhabitants, with a church, one store, a schoolhouse and a blacksmith shop. The surrounding country was settled by hardy farmers, principally engaged in raising flax, but owing to the great expense of transportation and the limited facilities for manufacturing, the products of the country were not available in improving the place.

About this time, Mr. Thaddeus Fairbanks invented the world-renowned Fairbanks Scale, known and recognized by all nations as the standard, and from that eventful period the growth and prosperity of this suburban village has gradually increased, until banks exist, stores and schoolhouses are numerous, and the little blacksmith shop of forty years ago has grown to be a mammoth manufactory, employing five hundred mechanics and consuming 2,500,000 feet of lumber, several hundred tons of coal, and four thousand tons of iron per annum.

Last year, Messrs. Fairbanks manufactured thirty-three thousand three hundred and eighty-three scales, and furnished the Passumpic Railroad with sixteen million pounds of freight. The disbursements of this company for wages alone, in 1868, averaged twenty thousand dollars per month. Thus, enterprise and industry populates towns and cities, builds railroads and factories, and brings to light the ingenuity of man.

The Decline in Stocks.—We, who go to work with our gloves off, says the *News Letter*, can state without circumlocution the real cause of the decline in stocks; they have been run up by persons forming rings for the purpose of selling out at large profits, and if they are low now it is because so many people have been ruined by them that, if they still have the desire to speculate in them, they have not the means.

More than $95,000,000 worth of boots and shoes will be manufactured in Massachusetts the present year, or more than the product of the gold mines of California during the past five years—illustrating the importance of encouraging manufacturing enterprise by patronizing home manufacture.

A Slight Misunderstanding.—A gentleman being in a room where a number of country girls were sitting without saying anything, said: "What an awful pause." At which a stout buxom lass, replied:

"I guess, sir, you'd have 'awful paws,' too, if you had to do all the scrubbing that I do."

Arrival of Butter from Chicago.—Mr. N. A. Butter, a celebrated merchant of Chicago, arrived from that city yesterday, to complete arrangements for the direct importation of tea. This is the most important Butter import ever received by rail.

A Spiritual Dog.—A pious old lady was asked why she named her dog "Moreover." "Why," she said, putting on her spectacles to find the place in her Bible, "It is a Bible name. Here: 'Moreover, the dog came and licked his sores.'"

A Zealous Anti-Baptist.—A baptizing ceremony at Melbourne, Canada, was interrupted Sunday, by a big brother of the young woman about to be immersed, who thrashed the clergyman.

There is a movement on foot in England to erect a monument to Adam, because he has the honor of being the father of all flesh. Jones says the man who originated the movement is a dam enthusiast.

Secretary Fish belongs to a family not described by Agassiz. He is not scaly—is neither a sardine nor a codfish of the aristocratic type. He does not flounder, has a soul, and is in a good place.

Ex-Congressman Spaulding is writing a history of greenbacks. The new work, though exceedingly interesting, is not intended for circulation in California.

All brutes are not quadrupeds, as any one may discover by watching the way some of our local teamsters treat their horses.

Dion Bourcicault is said to be writing a sensation drama on "Gold." He will not come to California for any of his material.

]From the Mechanic' Fair Daily Press, Oct. 25.]

James Lick's Machine for Gilding.

The covering of surfaces of bodies with a thin coating of gold, to impart to them a highly ornamental exterior, and one not liable to tarnish, is a very ancient and useful art. So also is the laying on of ornamental figures in gold, whereby only a portion of such surfaces is covered. This process is called gilding; but on account of the great cost of gilding material its use would be very limited were it not for its exceedingly extensible nature whereby a small quantity is made to cover a very large extent of surface, by being hammered out into exceedingly thin leaves.

Those portions of the surface to be gilded or ornamented, are first covered with some substance to which the thin films or leaves will readily adhere. Ordinarily, the leaves are then taken up, by careful manipulation, cut to suitable sizes, placed upon the proposed surface; after which, whatever does not adhere is carefully brushed away. Much handling and waste of gold is necessarily involved in this process. To obviate it, to some extent, by decreasing the handling of the gold-leaf, Mr. James Lick, of this city, has recently devised and patented a machine, by means of which the surface to be gilded is applied to the gold-leaf (instead of the leaf to the surface), while in the book, thus rendering the ordinary cutting and handling of the gold-leaf wholly unnecessary. The machine is readily adjustable, so as to be suitable to all sizes of work, and is simple and effective in its operation. The book containing the gold-leaf is placed upon a suitable support on an adjustable frame, where it is properly held, with the blank leaf turned up out of the way, while the glass or other material to be gilded is placed upon another adjustable frame and brought over and upon the leaf as it lies in its place in the book. So much of the surface as a single sheet of leaf will cover is thus gilded, and the book is moved along by proper fixtures, so that when the surface again comes down, it meets another leaf upon another section of the pattern, and so on until the work is completed.

The elegantly gilded glass frames shown in the central art gallery, at the Pavilion, were gilded by the aid of this machine; as were also the large frames to the mirrors which ornament the splendid dining room at the Lick House—the finest dining room on the continent. All the work, both in the Lick House dining-room and in the Pavilion, as well as a large amount of work in Mr. Lick's inside office on Sutter street, was done by Mr. L. himself, by the aid of the apparatus which he has devised and for which he has obtained letters patent.

The machine was devised by Mr. Lick at the time he was building his new dining hall, for the purpose of facilitating and more readily and perfectly accomplishing the gilding of the mammoth mirrors there empannelled. The ingenuity, industry, and perseverance displayed in this work by a man of the age and station in life occupied by the proprietor of the Lick House, is most remarkable, and furnishes an example of industry well worthy of imitation. This invention is not only important for its saving of time, by its precision of operation, but it must greatly economize in precious material. He who invents and publishes to the world through the Patent Office any process of economy is a real benefactor.

Boiler Fire Regulator.—Poillon's condensed steam piston packing has rendered practicable a matter heretofore impossible, because theory was interfered with by a bit of friction. There is no reason why the pressure of steam in the boiler, should not itself directly regulate the damper opening, by rod and lever connections. Mr. Poillon's packing causes so little friction that it has been found, on connecting a lever similar to that in the Poillon governor, with the damper, that a heavy pressure can be made uniformly and proportionately to close, or a light pressure to open, the draught door. Mr. Constable exhibits an inexpensive device of this kind which will keep the pressure in the boiler, when this has been once set by a weight on the lever, within four pounds of the same figure constantly.

"Can you tell me how old the devil is?" asked an irreverent fellow of a clergyman. "My friend, you must keep your own family record," was the reply.

[From the Mechanics' Fair Daily Press, Oct. 26th.]

The Times.

Everything seems to be dull and quiet at present. In financial circles the cry of hard times, and a "tight" money market continues to be heard, and the worst is that it is predicted there will be no change for the better until the first of the year, and possibly not until next spring, which means here, just after the rainy season. Our Literary Societies also seem to be in a rather quiescent condition. As a general rule the lectures, concerts etc., have been poorly attended, while even the Fair, although the chief object of attraction for some time past, has lost its interest for many who crowded it when first opened. The warm weather which we have had during the month past, has been succeeded by a colder atmosphere, while even as we write, the clouds threaten copious showers of rain. We have not been without some excitement however. The elections are over, and people have grown tired of reading the stirring appeals made to their patriotism in such forcible manner through the daily press. The Mercantile Library have been making great efforts to preserve their institution from being closed, and after the Fair is over, propose to use the building for the exhibition of holiday presents, charging a small entrance fee, and by other means endeavor to place their worthy institution on a safe financial basis. The Young Men's Christian Association are also endeavoring to raise five thousand dollars in order to cancel a floating debt, and place themselves upon a like paying basis. The Association is a most deserving one, and is the only *free* reading room on this coast. The amount is to be raised in $5 subscriptions, and we hope they will find no difficulty, even in these hard times, in raising the thousand needed subscribers.—*Social Voices.*

There will be a private exhibition of duck, geese, ganders, cormorants and doves near the fountain in the Pavilion, this evening, between 9 and 10 o'clock. It will require a close inspection to tell the ducks from the geese, as their plumage will be so much alike. The ganders will be easily recognized, so will the doves.

"Everything has its uses," said a philosophical professor to his class. "Of what use is the drunkard's red nose?" asked one of his pupils. "It's a lighthouse," answered the professor, "to warn us of the little water that passes underneath it, and reminds us of the shoals of appetite on which we might otherwise be wrecked."

An Honorable Family.—The Percy's are one of the oldest families in the British peerage. The most illustrious of the family, he who achieved the greatest distinction, was Percy Vere, and he who won the greatest infamy was Percy Cute.

There are more causual-ties in Chicago than in any other city in the Union. During the month of September last, one hundred and seventeen divorces were granted, and two hundred and seventy-six applied for.

The owners of an oil well in Pennsylvania have called it Olive Logan. Some of the lady's friends were irritated by the circumstance, because it was alleged that it bore the insinuation that she was a great bore.

A Devonshire matron, whose husband snores badly, keeps a clothes-peg underneath her pillow, and when his snoring awakes her, she adjusts the peg on his nasal organ, and then slumbers peacefully.

Dr. Cumming asks the Pope how it is that the Catholic priests are celibates while Peter was married. The Pope will probably answer that the custom has petered out.

Alex. Delmar, the quaint and curious perverter of statistics, has established a bureau in Washington for the manufacture of sensational treasury news, for Fiskal purposes.

The marriage is reported of a Mr. Rose to a Miss Violet. They will form a regular flower bed, and in due time that Rose will probably become a poppy.

An undertaker, having apartments to let, posted his bills upon the coffins in the window, announcing, "Lodgings for single gentlemen."

The hog may not be thoroughly posted in arithmetic, but when you come to a "square root" he is there.

[From the Mechanics' Fair Daily Press, Oct. 27.]

Dr. Rottanzi's Effervescent Drinking Cup.

On the counter of the Fair Press there has been placed on exhibition for a few days a very practical invention for the mixture and use of effervescent drinks, the inventor and patentee being Dr. Antoine Rottanzi of this city. Seidlitz powders, and all other effervescing substances of the kind, consist of a mixture of two powders, one of which is in the main a carbonate, and the other a harmless acid which attacks the former, liberating the sparkling carbonic acid that effervesces. Dr. Rottanzi's cup has a partition in the middle. One powder is placed in one side, and the other in the opposite; water is poured in on both, as much as the drink is to consist of. Neither powder sparkles until the mixture takes place. In this case the mixture occurs in the act of pouring out in a little spout on one rim of the cup. If the cup should be tipped back again, however, the residue would not be spoiled, but would remain in proper condition to be drunk at any time thereafter. For sea voyages especially, an article of this kind would be an agreeable and healthful companion.

Country Homesteads.—There are but few citizens in San Francisco that are blessed with money who will make better use of their coin than spending it for land in the country surrounding the bay. Of all the offers for sale of suburban property, we know of no one agency that affords so many favorable chances and advantages as that of Geo. E. Smith, Esq., San Leandro. He has been long in the business, has a large list of choice property for sale, and can give the purchaser easy terms in most instances. We should prefer to purchase of an established country agent of Mr. Smith's reputation, than of some loquacious city broker of less reliability. Mr. Smith has long been familiar with the titles and records of Alameda County, and has just been elected by its voters as County Clerk for the approaching term.

Suggestive.—Among the various goods exhibited at the Fair by the Capital Woolen Mills of Sacramento, are some mammoth blankets, nearly six yards wide, on which is a notice, "Made for Mormon Market." When a man has five or six wives and from thirty to forty children, as they do in Salt Lake City, he requires pretty wide blankets for the family bed. The Sacramento mill owners show great enterprise in preparing an article capable of covering such a multitude of sinners.

Dunbar's Self-Acting Steam Piston Packing has been used and patented for near a score of years. It is still being applied more extensively than any other self-operating packing. Henry S. Smith, of the Ætna Iron Works, is the general agent for the Pacific States. It is adapted to all classes of engines and locomotives and old and new cylinders.

Five years since we obtained a policy in the Connecticut Mutual Life Insurance Company, of Hartford, Conn., and if we were to increase our insurance we know of no safer, more economical, or better company to patronize. It is one of the oldest companies in America and probably the best in the world.

A Regular Cow-catcher.—During the recent flood in New England, an engineer discovered a cow swimming in the Hartford meadows, near the railroad track. He fastened a rope to her horns, making the other end fast to his locomotive, and towed the beast ashore. She proved to be a valuable cow, which had come down stream from the up-country somewhere, nobody knew from what State.

Yosemite Valley in its most glorious aspect is beautifully illustrated by Thomas Hill's famous picture, now exhibited at Snow & Roos' art gallery, corner of Kearny and Morton streets. All we have to say is, that if you have not seen it, lose no time in doing so, as it will leave the public gaze for the private gallery of Charles Crocker, Esq., the purchaser, within a few days.

Benevolence is not as attractive to the thoughtless as amusement. The Fair, since the receipts for entrance have been donated to the various benevolent societies of the city, is not frequented by the gay and festive youth of both sexes.

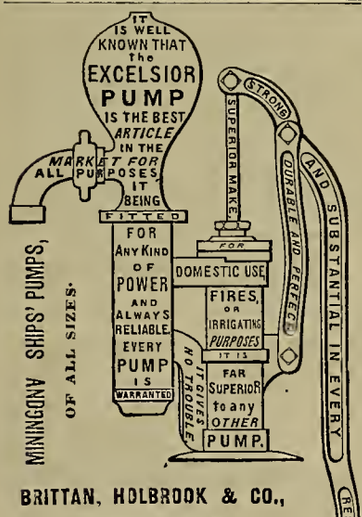
[From the Mechanics' Fair Daily Press, Oct. 28th.]

PIONEER IRON WORKS. — Kittridge & Leavitt, the proprietors of the Pioneer Iron Works, at Nos. 225 and 227 Beale street, have, within a few months past, greatly enlarged and improved their facilities for work, in the now location. They still continue to manufacture their improved steel-lined bank vaults and safes; also prison cells, fire-proof doors, wrought iron girders, etc., etc. They are now the proprietors and manufacturers of Bnssey's combination, burglar-proof bank and safe locks, a California invention, claimed to be the most perfect and effective bank lock in the world. Being operated without a key, no opening is presented, whereby the burglar can get a foothold upon which to commence his nefarious operations. After careful examination of its merits, by the aid of the most experienced experts, quite a number of our prominent banking houses have adopted this lock in preference to all others.

BRITTAN, HOLBROOK & Co.—This firm makes the finest exhibit in their line in the Fair. They exhibit stoves and cooking apparatus in great variety; also copper, tin, brass and tinned ware, and Japanese ware. These gentlemen are large importers and dealers in stoves, sheet iron, zinc, tin plates, wire, pipe, copper, pumps, etc. They make a specialty in their business of stoves and house-furnishing hardware, of which they always keep a large and varied assortment. Their place of business is at Nos. 111 and 113 California street, and Nos. 17 and 19 Davis street, to which we would refer all who may be in want of anything in their line.

BOILER MAKING in San Francisco is a large business, and rapidly increasing. Prominent among the few establishments which make this trade their special business, is McAffee, Spiers & Co., on Howard street, between Fremont and Beale. Although started recently, they are now doing a first-class and increasing business. We have long known Mr. Spiers as an intelligent mechanical engineer, and are pleased to note the success of the firm of which he is one of the leading members.

THE PACIFIC IRON WORKS, on First street, is one of the oldest and best regulated foundries in this city. Its range and capacity for work is hardly excelled on this coast. Its proprietors are men of experience and sound reputation, and the establishment is known for the general satisfaction given in the work turned out. Improved tools and good workmen can be relied upon at Goddard & Co's works.



IT IS WELL KNOWN THAT the EXCELSIOR PUMP IS THE BEST ARTICLE IN THE MARKET FOR ALL PURPOSES, IT BEING FITTED FOR ANY KIND OF POWER AND ALWAYS RELIABLE. EVERY PUMP IS WARRANTED
SUPERIOR MAKE
FOR DOMESTIC USE
FIRES, or IRRIGATING PURPOSES

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is confessedly the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a pure concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London. 18v19-6m

Office of the Company, northeast corner of Front and Jackson streets.

B. M. HARTSHORNE, President

13v12

Taxation of Undeveloped Mining Claims.

[Written for the Mining and Scientific Press.]

Editors Press:—Permit me to call your attention to a subject, the importance of which of which as affecting the mining interests of this county, and the desirableness of eliciting an expression of opinion from other counties similarly situated must be my apology if I seek to trespass somewhat unduly on your valuable space.

I refer to the taxation of undeveloped mining claims.

Equal and Unequal Assessment.

Up to last year the mines in this county were not assessed. In the fall of the year all the claims, whether developed or undeveloped, were made the subjects of assessment; on what principle the Assessor frankly admitted himself unable to explain; but, as it appears to me and many others, in a manner so arbitrary and unequal that some claims were valued at twice the amount of others of same extent, similarly situated, and on the same ledges, not perhaps intentionally, but simply because there was really no means of ascertaining their value.

An Appeal.

As manager of an English company operating here, it became my duty to appeal against the assessment to the Board of Supervisors, to whom I stated that, although I could not object to a fair assessment on improvements made by the company, the legality of which had been judicially established, I should be guilty of a dereliction of duty if I did not protest against the imposition of any assessment whatever on the *claims themselves* until their yield of bullion had given them a taxable value; that I had already passed one of the ledges they had assessed, which, notwithstanding the assurances of the vendors to the contrary, had proved no ledge at all, and that there was no guarantee that the other nine might prove equally valuable.

The Law about Undeveloped Claims.

In support of my position, I pointed out:

1st. That the statute book of California contained no authority for the imposition of a tax on undeveloped mining claims, and that all the legislation on the subject had been in quite an opposite direction. Endorsing the advice given them by the District Attorney, who was there in support of the tax—that the statute only was to be their guide, and that whether they exceeded or failed to exercise the power there given them, they equally failed in their duty—I called on them to act strictly on his ruling, and with me to consider the statute which gave them their powers as a Court of Appeal. The Revenue Act of 1854 expressly exempted mining claims; the repealing Act of May 17, 1861, by virtue of the provisions of which they sat there, the root and basis of all their powers (Sec. 4), exempted them; the Act of 1866 exempted them; then came the Act of March 30, 1867, which alone afforded them the least shadow of an excuse for the taxation of mining claims. Directing their attention to the fact that only Sections 4 and 13 of the exempting Act of 1867 were amended, and a clause to the effect that all *property* should be taxed substituted, reminded them that this was a tax on *owners*, not on occupants; that the property or fee simple of the mines is in the State; that until a patent was obtained that property remained in the State; all that the miner had being the tacit sanction of the State to dig for mineral. I quoted from Bancroft (p. 554) where it is laid down, "In the case of California, the Supreme Court held that the State is entitled to all the rights in mines of gold and silver enjoyed by the Crown under the common law (of England); that such mines belong to the State of California, and that the United States, in its ownership of the public lands, occupies the same position as a private proprietor, with the exception of an express exemption from taxation." I adduced the case of Jackson *vs.* The Feather River Company (14 Cal., 181), where the Court remarked that the right of the occupant to the *possession* of mineral land "was about all the claim he had to it." Yale, again, who has in his able treatise on the mining laws of California, committed himself to an opinion to the effect that, at the will of the Legislature, he sees no reason why mining claims should not be taxed, but which in my humble opinion the whole of his book goes to disprove. In commenting on the Mining Act of 1866, he says, p. 356: "This Section (Sec. 1) confers no title to mining claims other than possessory rights." "It is," he adds, "a mere license by Government to go on the public domain and search for minerals without charge. It may be revoked at any time by Congress by a simple repeal of the law, and the right would end."

Argument.

I appealed to them, therefore, how in the name of common sense, any man could maintain in the face of such a definition of the miners' title, that his was a property in the sense of an act which taxes owners only, not occupants. The fee could not be in two parties at the same time. The fee was in the State; the State could not be tried; the State permitted the miner to search for mineral on the State property, free of charge, and yet the Board would assume to themselves the power of levying a tax for State purposes, from a mere tenant at will, whose holding the State itself does not consider of such a nature as to be worth even a nominal rent; or, if it does, wisely abstains from enacting it.

Section 1 of the act above referred to (July, 1866), enacts, in no ambiguous language, "That the mineral land of the public domain," both surveyed and unsurveyed, are declared "to be *free*, and open to exploration," etc. They are not free if,—the moment exploration commences,—the County Assessor and the Board of Supervisors can assess them as they please.

I reminded them that the original act of 1861 was still in force, with the exception of the amended sections 4 and 13; that section 5 provided that all taxable property should be listed under one of two heads, real or personal, and that in the elaborate, and carefully drawn category of subjects under each of those heads, it was impossible to find one which could by any possibility be made to include mining claims. Had it been the intention of the Legislature to tax those claims, this section would have been amended, so as to include them. Standing as it does, they cannot be taxed, and as they can't be taxed, they can't be assessed. The instruction to the Assessor in the act, given in another section, are peremptory on this point.

The Intention.

Whatever, therefore, may have been the intention of the framers of the Act of 1867, they had failed in making it law that non-producing mining claims were to be taxed. But they had no such intention. Had it been their intention to acquire a revenue from claims of this description in a country where mining is the staple, and where previous legislation had wisely always carefully exempted the undeveloped mining claim, the Act would have been explicit and unequivocal,—the mining claim would have been mentioned in *ipsissimis verbis*.

The Board could not therefore put a construction on its terms which previous legislation forbade,—more especially when such a construction was oppressive to the miner, tended to interfere with the liberty of the people, and was an infringement of the time honored maxim, that "all tax-imposing statutes are to be interpreted *strictissimi juris*—a principle, which, when there is any doubt, gives the party aggrieved the benefit of the doubt.

And, even if they had such an intention, there existed in the Legislature no power to tax locations on the public land, as the *property* was not, as before stated, in the individual, and as the public land is expressly excluded from taxation by the terms of the *Act admitting the State to the Union*.

Precedents.

My second ground of appeal was, that up to the present date, there has been no judicial decision in this State to the effect that undeveloped claims were to be taxed; and I challenge the Board and the District Attorney to show me any such; stating that as my constituents wished me to pay everything just and lawful, I would pay cheerfully on the amount assessed without further trouble, if they could refer me to any such decision; but if not, they must excuse me if I demurred to paying what appeared to me, at least, to savor very much of an opposite character.

I was then referred to the case of People *vs.* Moore, 30 Cal. 645. Fortunately for me I happened to know that no such doctrine was there laid down, and having appealed to Yale, read from page 91, as follows: "In the case of People *vs.* Moore, the Supreme Court on appeal held that *the claim itself being exempt from taxation*, it would be absurd to suppose the Legislature intended by the same Act to levy a tax upon the price paid for it, or the money expended on it." (The price paid for the claims was $20,000, and Moore had expended some $500 in constructing a tunnel to work them); and further, on page 92: "The case of the People *vs.* Moore does not establish an exemption like this." (He was writing in Hart *vs.* Blum, where the question whether a flume connected with a mining claim was taxable under the Revenue Act was involved,—for, adds Yale, "that case decided that the claim itself was exempt."

The Claim and Issue.

On their own showing, therefor, I claimed for my company absolute exemption from any tax on their locations, except in so far as they had made substantial improvements in the shape of buildings, etc., etc.; but all I could obtain was a reduction of the assessment on the claims themselves from $1,500 to $750; on which, believing that the matter would be judicially decided before another year, I paid, rather than involve the company in an expensive litigation.

Practice Elsewhere.

But the mining claims are assessed again this year; and my object in writing, is to ascertain if possible, through your columns, what is the practice in other mining counties, and to elicit an expression of opinion on a subject of vital importance to the future of any district, where its all depends on the success of its mining enterprise.

The Policy.

In place of imposing burdens on those, who, in hopes of future gains, are sanguine enough to invest largely in exploring the country, a more prudent policy suggests itself. Impose no restrictions except such as are necessary to regulate the acquisition, holding and working of the ground,—already in existence in the shape of the miner's rules and customs peculiar to every district,—induce capital by every legitimate indulgence; afford it all facilities until your district proves that it has its *quid pro quo* to offer in the shape of bullion; tax the bullion, and there will be no complaint, owners will be only too willing to pay it. your excessive duty would be comparatively easy, and a legitimate source of revenue opened up to the county. But where there is no bullion, let there be no tax. Outside capital is exploring the country for you, and in doing so, the pockets and patience of the explorers are already sufficiently taxed in carrying on works in mining regions, where,—while labor and mining supplies are often necessarily dear,—the nature of the work calls for heavy expenditure, and the uncertainty of success is not a redeeming element! Time enough to tax the claim when it becomes a producing mine. Even the diamond has no value until cut. Until a pay ledge is cut, there is really no mine to tax. Yours, etc.,

Lewis Chalmers,
Manager Imperial Silver Quarries Co.
Bulliona, Alpine Co., Oct. 7th, 1869.

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling Ornit, Lee, Parker, Acton, Aitken Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

PATENT AGENCY.

DEWEY & CO.,

Solicitors of

American and Foreign Patents,

414 Clay st., bet. Battery and Sansome,

San Francisco.

Patent Cases of every kind conducted. Attention given to Re-Issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

Assignments, Powers of Attorney, and Letters of Advice carefully prepared.

Consultation, by mail or otherwise, strictly confidential. Advice free.

Circulars containing information for inventors sent free.

The inventors of the Pacific Coast, of all others, should be careful to patronize only well known responsible agents.

COUGHS AND COLDS are often overlooked. A continuance for any length of time causes irritation of the Lungs or some chronic Throat Disease. "*Brown's Bronchial Troches*" are offered with the fullest confidence in their efficacy, giving almost invariably sure and immediate relief.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat,**

Sudden Colds, Coughs, Etc.

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to imitate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

A Family Medicine.—The PAIN KILLER is a purely vegetable compound and while it is a most efficient remedy for pain, it is a perfectly safe medicine, even in the most unskillful hands For Summer Complaints, or any other form of bowel disease in children or adults, it is an almost certain cure, and has, without doubt, been more successful in curing the various kinds of Cholera than any other known remedy, or the most skillful physician. In India, Africa and China, where this dreadful disease is more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, *a sure cure.*

We have long known the high character of the PAIN KILLER, and that it issued with great success and satisfaction in our best families. It is the favorite medicine of our missionaries in heathen lands, where they use it more than all else together for the diseases that abound in those warm climates. It should be kept in every house, in readiness for sudden attacks of sickness,—*Chr. Press.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

PERRY DAVIS & SON, Proprietors, Providence, R. I.

WALTHAM WATCHES.

Let every one who wants a Watch, read this carefully.

Especially if in some remote out-of-the-way place.

Now that the railroad is open, we propose to give the residents of CALIFORNIA the opportunity of getting single genuine Waltham Watches at the

Lowest New York Wholesale Prices.

We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers in every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List, we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it: if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or

REFUND THE MONEY.

As an indication of the Prices, we will quote one Watch from our list The P. S. BARTLETT, *Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,*

$28 in Greenbacks, or about $20 in Coin;

All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,

HOWARD & CO.,

Jewelers and Silversmiths, 619 Broadway, New York.

ARMSTRONG PATENT

Heater, Condenser and Filter, Combined.

BOILERS, HIGH AND LOW PRESSURE,

Pump, Pipe and Sheet Iron Work of all kinds; Quartz Crushing and Amalgamating Machinery, including High and Low Mortar for wet or dry crushing; Furnaces for roasting ores; Horn, Wheeler's, Patton's, and Belding's Amalgamating Pans and Settlers; Heady's Concentrator; Hungerford's Concentrator; Hunt's Grinder; Blake's Crushers; Stamp Shoes and Dies of the best white iron; Russia Iron Screens, etc.; Flour Mill and Saw Mill Machinery in every variety; Hendy, Gang, Saw Mill, Pumping and Hoisting Machinery; Excelsior Force Pump, for domestic, ship and mining use—the simplest and best in use; Iron and Brass Castings of every description; Steamboat Repairs; Boiler Making executed with despatch. Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & EOKART OUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Offs at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate a change of load upon the engine *that the correct speed of the engine is maintained with* wonderful uniformity *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.

O. CHAUVIN.....Agent.

OFFICE, 500 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the vellous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness with the advice of a physician, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the physician only can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and settlers for themselves, at the office, **220** Fremont street,

1v1 San Francisco.

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

—AND ALSO IN—

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19 3m

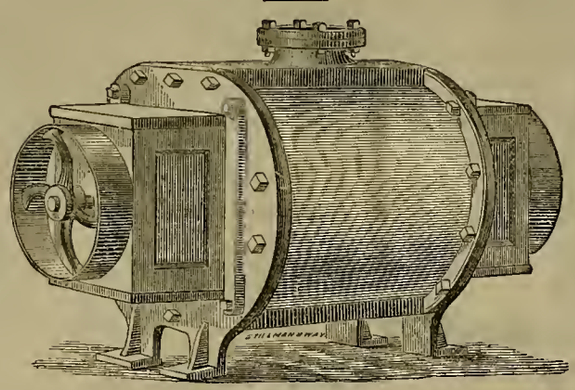
BY MAIL.—The *Mining and Scientific Press* will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of the old and new location, and the paper will be sent accordingly.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

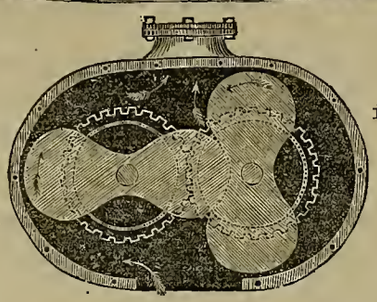
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

21v12 F. E. WEYGANT, Proprietor.

[SPECIAL NOTICE.]

Winn's Patent Shampooing Apparatus.

By the use of the apparatus here shown, the unpleasant mode in which the operation of shampooing is usually performed, is converted into a neat and tidy process, very effective and decidedly agreeable. By the aid of this apparatus, the head is washed and scrubbed in a bath of water, of any desirable quantity or temperature, and the employment of which, upon the top of the head, is productive of the most delightfully agreeable sensations, such as impart an entirely new feature to the process of shampooing. The apparatus is tasteful as well as substantial in its construction; and its use is equally as effective when applied to the long, flowing hair, as worn by the ladies, as to the shorter hair of gentlemen's wear.

To form this apparatus, a rim or bottomless pan is first constructed, with a gutta percha lining so devised and provided with an elastic strap, as to fit tightly around the head, below the principal part of the hair. The drapery or curtain, which is seen to fall below the rim, is both for ornament and use; it serves to conceal from view the somewhat unsightly straps, lining, etc., which form the water-tight joint between

the head and apparatus thereto applied, and a subsequent elastic gutter, which is strapped tightly about the head, at the extreme lower part of the hair, to catch any water which may possibly escape from the main apparatus. As seen in the engraving, each has a flexible tube appended, by which the water may be carried off to a sink or other suitable receiving vessel, so that the person will have no occasion to leave his seat during the entire operation, or even to remove his neck-tie.

The soap-suds or any other shampooing fluid which may be employed, is poured upon the top of the head, within the rim, after it has been properly adjusted, and a brush or mop, or sponge, or any other suitable instrument, is then employed within the body of the liquid to clean the head and hair. The liquid is readily discharged through a stop-cock and the tube shown in the rear, and fresh water for rinsing applied, as often as may be desirable. Standards, with curved rests or supports, placed upon the shoulders, and adjusted by screws upon the top, all shown in the engraving, are affixed for the purpose of taking the weight of the apparatus and a portion of the weight of the water from the head. The flexible rim which adjusts the apparatus to the head makes this device practicable.

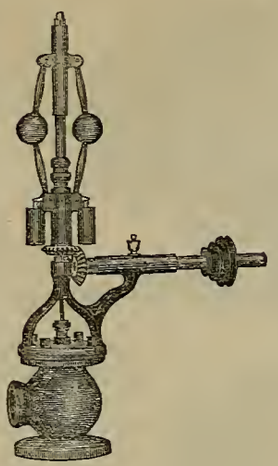
Previous to putting on the rim an elastic strap is placed around the head to hold up the hair intended to be included within the rim, when it may be properly washed and cleansed. This arrangement is particularly useful and indispensable in fact, in shampooing the head of a lady with flowing hair. This combined apparatus renders the process of shampooing as easily and as readily performed for a lady as for a gentleman. Mr. M.L. Winn, of this city, the inventor and patentee, exhibited his apparatus and the practical employment of the process, in the Mechanics' Fair, and will soon open a saloon in this city. The patent was obtained by the M. & S. PRESS PATENT AGENCY.

GEORGE T. PRACY'S

MACHINE WORKS,

109 and 111 Mission Street, between Main and Spear,

SAN FRANCISCO.



MANUFACTURER OF

PRACY'S IMPROVED

Patent Steam Engine Governor,

The Simplest and Most Sensitive Governor Built.

This Governor is made of the best material, the shafts being of cast steel and the bearings small, thereby avoiding the use of heavy balls and springs, running at a high velocity and maintaining a uniform speed. All sizes of these Governors are kept constantly on hand, and can be seen in operation at my works.

I also take pleasure in informing the public that during my recent visit to the East I became SOLE AGENT for

L. W. POND'S CELEBRATED TOOLS'

ACKNOWLEDGED TO BE

THE BEST NOW MADE.

I shall keep constantly on hand all descriptions of

Lathes, Planers, Drills, Boring Mills, Milling Machines,

And every description of MACHINISTS' TOOLS, which I shall offer to the public at manufacturers' rates. Also

Morse's Twist Drills and Chucks of all kinds.

MANUFACTURER OF

ALL KINDS OF STEAM ENGINES AND MILL WORK GENERALLY.

☞ JOBBING PROMPTLY ATTENDED TO. ☜

SOLE AGENT FOR TAFT'S PATENT SHEARS AND PUNCHES.

GOLD METAL, OR COLLINS' METAL WATCHES.

IMPROVED OROIDES.

Great Reduction! Prices in Greenbacks!!

We have made great improvements in our Watches lately, and will hereafter send only our BEST QUALITY, WITH BILL OF COLLECTION IN GREENBACKS.

BEAUTIFUL WATCHES for Ladies ..... $15 and 20
" " for Gentlemen..... 15 and 20
LEONTAIN CHAINS for Ladies' Watches..... $6
LONG NECK CHAINS for Ladies' Watches..... $6
GENTS' VEST CHAINS..... $3 to $6

The firm of C. E. COLLINS & CO., so long and favorably known in San Francisco, will be closed after September 15, 1869, and will continue in our

NEW COLLINS WATCH FACTORY,
No. 335 BROADWAY,
CORNER OF WORTH STREET, NEW YORK CITY.

☞ When SIX Watches of the above are ordered at one time, we will send one Watch FREE, making seven Watches for the price of six.

We deal largely in WATCHMAKERS' TOOLS AND MATERIALS, as usual.

Avoid persons who propose to sell the GOLD METAL or COLLINS' METAL WATCHES, as the GENUINE can only be got of us, and no one is authorized to use our name in any way.

Address,

C. E. COLLINS & CO.,
No. 335 Broadway, Corner of Worth Street, New York City.

MINING AND SCIENTIFIC PRESS.—This San Francisco journal is an able exponent of the mining interests of the country.—*Empire, White Pine.*

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1849, and endowed with the National Land Grant in 1856, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger, heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Branch Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass. GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco. Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use since 1847, when in the New Orleans Mint. I have always preferred the Crucible of Dixon's make over Adus, Gaulier, and Taunton, Mass. Yours I find to be not alone of more fine-sized make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others, and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

A Journal of Useful Arts, Science, Mining, Farming, and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, NOVEMBER 6, 1869. VOLUME XIX. Number 19.

Mechanics' Institute—Regular Meeting.

A regular monthly meeting of the Mechanics' Institute was held on Thursday evening, at the Institute hall on Post street. President Hallidie presented a report of the result of the late Fair, the substance of which will be found elsewhere in our columns. Owing to the small attendance, the lecture which had been announced by Mr. Burgess was postponed until the next meeting of the Institute, of which due notice will be given.

The President announced that the report on awards and diplomas was not yet complete—that which was read on the last evening of the Exhibition, and which was subsequently published in the daily papers, was neither full nor accurate. In fact, some of the committees have not, even at this present writing, handed in their reports. We shall give the official report in full in our next issue.

[We may here state, of our own knowledge, that the complaints which have been so freely uttered since the preliminary publication of the awards, have grown out of the imperfect and informal action of some of the committees, and the total lack of action on the part of others, and should not be held against the Managers of the Institute or the Exhibition. Those gentlemen are anxious that equal and impartial justice shall be done to all, and are determined, so far as their power and painstaking can affect such a result, to reach it.]

Mr. W. F. Herrick, who was sent East several months since, as General Agent of the Institute, submitted a preliminary report of his action and the observations made and information obtained with regard to the history and standing of most of the leading Mechanics' Institute organizations at the East. The report was both interesting and suggestive, and showed that the mechanics of San Francisco, in their energy and enterprise in this direction, stand ahead of those of any other city in the Union. We shall allude to this report again at some future time.

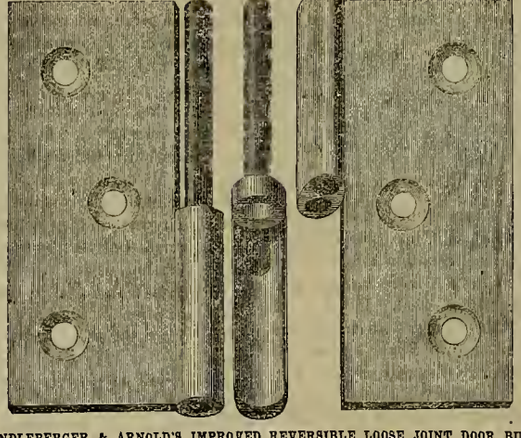
YALE COLLEGE COURANT.—This valuable journal, published at New Haven, Conn., has a new feature. It has commenced the publication of a series of biographical articles, to be illustrated. The subject of the first is C. W. Eliot, the new President of Harvard College. The series will be continued from week to week. New scientific apparatus will be illustrated from time to time; also, views of college buildings, and other cuts appropriate for such a publication. The *Courant* numbers among its contributors a large proportion of the college Presidents and Professors in the United States.

J. ROSS BROWNE will discourse on the Chinese Political Puzzle and the Tartar Court, at the Mercantile Library Hall, on Monday evening next. Some important and interesting developments with regard to the Chinese Mission may be expected.

Kindleberger & Arnold's Improved Reversible Loose Joint Door Butt.

This invention consists of an improved door butt, so constructed that it can be adjusted to open and close on either side—that is, so that it can be changed from a right to a left hand butt, as desired; and that by simply changing the position of the parts, the general symmetry of the butt is preserved, while its strength is increased, making it, it is claimed, much more durable than the ordinary door butt.

Referring to the accompanying engraving the left hand leaf is constructed similar to the leaves of ordinary door butts, having a cylindrical lug extending from one end to near the middle of the leaf, and a stationary pintle projecting upwards from the upper end of the lug. The opposite or right hand leaf is provided with a lug which



KINDLEBERGER & ARNOLD'S IMPROVED REVERSIBLE LOOSE JOINT DOOR BUTT.

is made in the form of an ellipse, extending downward to near the middle of the leaf. This lug is so attached that if the leaf were extended sideways, it would divide the ellipse, longitudinally, through its center. This ellipse is provided with two holes or sockets, one on each side of the ellipse, as distinctly shown, and extending the entire length of the lug.

As already stated, the two lugs do not meet in the middle of the butt; but a small space is left there, which is filled up by an elliptical washer, having a semi-circular projection upward which fits around the lug on the left hand leaf. When this washer and projection is fitted to the cylindrical lug aforesaid, that also assumes an elliptical form, corresponding in size and shape to the lug on the right hand leaf in engraving. This elliptical washer is provided with a hole on one side of the ellipse (the front in the engraving) also a pintle, extending upward, but a little shorter than the pintle connected with the cylindrical lug on the left hand leaf; so that by entering the pintle on the left hand leaf into the socket of the washer, and slipping the washer upon the cylindrical lug, a sufficient addition is made to that as to give it the same form of the other, as already stated.

This combination being effected, then by fitting the right hand leaf to the left so that its two holes or sockets will receive the two pintles, the butt is put together in working condition.

To change the butt so as to cause it to open in a direction contrary to that for which we have now supposed it to be set, or in other words, to change it from a left to a right hand butt, it is only necessary to remove the right hand leaf, and change the position of the pintles so that the short pintle will enter the hole in the lug upon the right hand leaf, from which the long one was removed, and the long pintle will enter that from which the short one was removed—thus completely changing it into a butt opening in an opposite direction. The screw holes on both leaves are countersunk on each side. Kindleberger & Arnold, the inventors, have assigned their title to the above invention to the "Inventors Association of San Francisco."

This invention was recently patented through the M. & S. PRESS Agency, and received a diploma at the late Mechanics' Institute Fair.

LABOR AND CAPITAL.—The daily production of the combined capital and labor of the country, is set down at $25,000,000; or $7,000,000,000 annually. With such a capital, and with resources such as are possessed by the United States, combined with the impressible energy and aspirations of our forty millions of people, who can predict the future of wealth and power which the American people must attain at the close of the next century, when our population will reach one hundred millions of souls!

GRADUATES OF TOLAND MEDICAL COLLEGE.—Following are the names of the graduates at the Toland Medical College on Wednesday: R. Caldwell, C. S. Haile, C. A. Toland, W. A. Cochrane, A. Weber, J. C. Clark and A. Younger.

More Electro-Metallurgy.

Dr. J. H. Rae, the Superintendent of the "Desulphurizing Electro Mining Co.," of Syracuse, N. Y., and Empire City, Colorado, writes to us that he is the discoverer and patentee of an electric or galvanic extracting process, dating September, 1866. He says:

My experiments were continued successfully, and on the 5th day of February, 1867, my first patent was issued for a new and improved method of recovering the precious metals by the application of electricity.

On the 12th of March, 1867, a second patent was issued to me for the recovery, by the same agency, of gold and silver, from filings, sweepings and earths, and for the use of linings or facings of baths, tubs or cylinders, as electrodes in the recovery of such metals by electricity or galvanism.

On the 13th of October, 1868, a third patent was issued to me for electrical amalgamators or cylinders lined with copper, with zinc arms upon the shafts, or zinc linings with copper arms, or any other metal capable of producing a galvanic current by the aid of appropriate chemicals.

These patents were made public, and I have since continued to expend my time and my resources in bringing the process to perfection, and putting the same into practical operation.

These patents will, as I conceive, be found to cover the application of electricity or magnetism, in any mode in which it has hitherto been or may hereafter be applied, for the purposes indicated.

I am now at this place, have taken a mill, my machinery is constructed, and within one week will be in operation.

I have already worked 700 pounds of refractory ore at a time, and accomplished results greater even than those of which you speak, and I cannot doubt that I shall be able to recover, substantially, all the gold or silver from the most refractory ores. From this place I shall proceed to California, and shall there put my process into full operation, and shall offer the advantages of a very simple and economical process to others. JULIO H. RAE.

The application of electricity to the reduction of ores is at least twenty-five years old—since Becquerel's experiments—and as there are many roads to Heaven according to the denominational philosophy, so there may be more than one method of accomplishing desired results in electro-metallurgy. If our correspondent has hit up another *right* road, California will exceedingly rejoice.

DRIED FRUIT.—An unusual amount of dried fruit has been prepared and sent abroad from El Dorado county this season. We trust the example will be followed in other localities. Drying fruit might and should be made a large and profitable business in this State. It is a shame and disgrace that so much fruit should be suffered to go to waste in a climate so well calculated for out-door drying as is here enjoyed. It tells heavily against our thrift and industry, unpleasant as may be the acknowledgement of the fact.

CORRESPONDENCE.—We have quite a mass of correspondence on hand, accumulated during the continuance of the Fair, to which we shall attend the coming week.

Farming and Gardening.

California Fruits at the East.

The Eastern papers still continue to notice the arrival at the East of California fruit, particularly pears and grapes. The Chicago *Tribune* of Octoher 26th, speaks warmly of the arrival of hoth of these fruits in excellent condition—more large and luscious than the Eastern fruits; as the fruits of the eastern side of the contineut hegin to fail in quantity and quality, those of the western come iu richer and in hetter order than early in the season. The *Tribune* thinks that California fruits will eventually hecome an important addition to the food of the people there, hy the low prices at which they will eventually be offered in that market. Such testimony is encouraging to California fruit growers, notwithstanding the failures of their first shipments. The experience of this year will be of great importance to future shippers, in teaching them how to pick and pack their fruits for railroad transit, as well as what variety of fruit to ship. The greater length of the California fruit season gives us great advantage for early and late shipments—holding up during the short run of the Eastern fruit seasou.

Our Grapes and Wines.

Rohert Buchanan, with several other gentlemen of Cincinnati, O., visited California this season, and was present at the State Agricultural Fair in Sacramento, and the Mechanics' Institute Exhibition in this city. On his return he read a paper before the Cincinnati Horticultural Society, in which the following paragraph occurred:

"We saw a single hunch of Victoria Muscat grapes which weighed eight pounds! But the great grape of California is the Mission grape, a foreign variety, introduced into California by the Spanish missionaries more than eighty years ago. As a wine grape, this holds among other California grapes the same place that Catawba held with us twenty years ago. Both a red and white wine is made from it. We observed this wine as it ran from the press, and the must was so rich in saccharine matter as to weigh as high as 115 per cent, while 85 was rare in the best Catawba, thus making the difference of 30 per ceut. hetween the wines. This admirable wine grape is sold at one cent a pound for those grown on the foothills of the valleys; those grown ou the level ground of the valleys only for three-fourths of a cent a pound.

The yield of wine is enormous. It is not uncommon to have 1,000 gallons to the acre. His friend, Mr. Werk, who was a better judge than himself, was enthusiastic on the matter, and regarded California as hound to hecome the great wine region, not only of America, but of the world. While there, Mr. W. pnrchased 10,000 gallons of the Mission grape wine, to be delivered the ensuing winter in New York.

To Prevent Hens from Setting.

When a hen shows a persistent desire to "set," it is an irresistihle impulse of her nature, which, for a time, it is impossible for her to resist; aud would be, even were she endowed with reason. Then how futile, how crnel to treat them to a twenty-four hour cold bath in three or four inches of water, or any of the score of other cruel torments to which they are often suhjected. Time alone will cure the impulse; hut if we would shorten that time, how much more rational, humane and effective to employ some means in accordance with nature, and the instinct which nature has provided. The *Rural Agriculturist* suggests a remedy, generally within ready reach, and in accordance with the above suggestion: "Put under the hen a few eggs just about ready to hatch; or put one or two young chickens under in the night time; take her off and put her in a box with the young chickens a few hours, and then take them away from her and turu her out, and in a majority of cases, she will, after clncking for a day or two, commence laying agaiu, feeling in her own mind well assured that she has fulfilled the maternal instinct."

The Plowing Season.

Now that the season of plowing has began, it will he well for farmers to look ahout them for information on this important portion of farm labor. The first thing to be attended to is to obtain the hest implements, and the next to obtain competent and practical men to do the work. Care should he taken that the work is done only when the ground is in proper condition. Land is often injured for years by being plowed when too wet. Better *miss* one entire crop than hurt the land in that way. The whole value of plowing depends entirely upon its having the effect of loosening up the soil so as to permit a free circnlation of air and moisture through it.

We know of no hetter chapter on the theory and practice of plowing than that which was given, with illustrations, in our issue of September 4. Farmers would do well to re-peruse that article at this time. However well land is manured, its utmost yield will never be rcalized unless it is thoroughly pulverized hy plowing and harrowing. It is only the impalpable powder of the soil, which is freed from the stones and lumps, that exerts any special influence on the production of crops.

The importauce of deep plowing is now pretty generally acknowledged; but now and then we still find some non-progressive individual who disbelieves in it. Such an individual recently found his way into a meeting of the Farmers' Club, which holds its regular weekly sessions at the Cooper Institute, New York City, who was noticed as follows by one of the reporters: "The Champion of Shallow Plowing exhibited corn roots which he had carefully washed out of the soil, to show that they had laid within two inches of the surface; and he asked the appointment of a committee to investigate this matter as to the relative depth the roots of plants ruu. An advocate of deep plowing responded that if the gentleman supposed that men advocated deep plowing for the purpose of inducing roots to go down he was mistaken. Roots only go dowu when the ground is plowed so shallow and the texture of the soil is such that they cannot get moisture and nutrition without. Deep plowing secures to the plants this condition at the surface. The committee was not appointed."

Profits of Flax Culture.—Mr. Peter Storm, of Watsonville, has raised 65 acres of flax the present season, which he thinks will average 2½ tons of fibre to the acre, and 1,800 pouuds of seed. He has contracted to sell the former to the San Francisco paper mills for $40 per ton, or $100 per acre. Other parties will pay him 4 cts. a pound for his seed, or $72 per acre; making a total of $172 per acre of yield. Making the most liheral allowanco for the greater cost of preparing and marketing this crop over that of wheat, it will be seen that flax raising, at present priccs, is much more profitable than wheat growing.

Farm Associations at the East.—The New Yorkers are getting up farm associations among the Germans in New York City. Farms of, say 25 acres each, are sold for $300, and are paid for in installments of $2 a week. The associations organized for the purposes of obtaining farms at low rates, consist of 50 members each, and purchase large tracts of 1,250 acres. Californians might profit by this example.

There is au orange tree in Los Angeles on one-half of which hang 6,500 ripe oranges, while the opposite branches are thickly covered with fresh blossoms which lade the air with their rich aroma. The usual time for orange trees to bloom, in that section, is in February, and Dame Nature seems, in this instance, to have forgotten herself.

Good Farming consists in prodncing as great quantities as possible of vegetables that do not exhaust the soil, and selling them in an animal rather than a vegetahle form.

Sheep.—Illinois spius and weavos the wool of 2,500,000 sheep. Consequeuce—her farmers are mostly out of debt.

Plowing Matches at Marysville.

The two rival gang-plow manufacturers of Marysville—Messrs. Hill & Knaugh and Mr. A. Ellison—have recently had several interesting and quite exciting plowing matches. At a trial on the 16th ult., according to the *Appeal*, high and dry and hard ground was selected. The Hill plow was drawn hy six and Ellison's hy four heavy horses. The audience was mainly composed of farmers and plow dealers. Some good plowing was done, aud the match was proving very interesting and exciting when an accideut happened to the Ellison plow, which struck an old road bed with snoh force that the iron holts in the heam were drawn over an iuch into the hard wood and the beam itself split.

In consequence of this accident the match was tried over again on the 23d ult. with the following result, as reported hy the *Appeal*: "Hill's plow did some good plowing, running an inch deeper than Ellison's. Ellison's plow was set for four or five inches, and ran very finely—throwing up the dirt as evenly as if it had heen harrowed over." The *Appeal* adds that these matches are exciting considerahle interest, hut result in no reliable and authentic expression of opinion; aud suggests that there should be an arrangement to plow a given piece of grouud in the presence of competent and impartial witnesses, who should make an official report of the same for the benefit of those who caunot attend to judge for themselves.

A Prolific Squash Vine.—A mammoth squash vine was raised by Mr. G. P. Sampson, in Doniphan County, Kansas, the past season, which branched into four vines, running in four opposite directions, ahout twenty-five feet each way, and covering ahont 2,500 square fcet of ground. The main vine, near the root, was ten inches in circumference, and the entire product was 150 squashes—forty-six of which averaged 22½ pounds each. This is probably the most remarkable growth of squashes ever noted. The writer of this once saw a pumpkin vine in the town of Medway, Mass., which somewhat exceeded the above in the diameter of its main stem; but which was of less extent of growth; and product—only three small pumpkins being matured upou it. It is rare that such efforts of nature, in the production of excessive growth in vine or stalk, yield much frnit. Such phenomena are modifications, not "sports" of nature; they are the result of the continued influences of surrounding circumstances, and always have a cause, but one which is usually hidden from human ohservation.

Oregon State Fair.—The late Oregon State Fair appears to have been quite a success. The show of horses, cattle, machinery and agricultnral products, is represented as all that could have heen expected; but the most interesting feature was the show of people. Not only were the people present in greater numbers, but the multitude made a more presentable appearance than on former occasions of the kind, and exhibited more evidences of thrift, enterprise aud general prosperity. The numher of visitors is set down as over 15,000. The numher of entries was about 3,000.

Orders for Ramie.—Numerous orders for the ramie fibre have been received from Europe hy Mr. Gregory, the well known ramie grower. Orders to the amount of twenty-one tons have been received, the heaviest coming from the lace mannfacturers of France.

Destruction of Orange Trees.—It is said that not less than 10,000 orange trees were destroyed iu Santa Barbara County hy the forest fires which were so unmerous in that part of the State just previous to the late rains.

"A Hardy Breed of Sheep."

[Written for the Mining and Scientific Press.]

Editors Press:—Uuder the above caption there appeared in your valuable paper of September 11th an article which interested me much, as I am inclined to helieve that it will elucidate a point which, to me, has long been a mystery.

The "Herdwick sheep," which is now deemed so valnahle in the mountainous Lake District of England, correspond in their qualities to those described in your journal as heing found only in the mountains of Navarre. From a knowledge of their possessing similar qualities to those described in the article named, I recommended them to the attention of residents of the Alpine districts of California, in my work puhlished in San Francisco, called "the Sheep-Breeder's Guido," uow almost out of print. After this little work was published, oue of our local newspapers, in reviewing it, specially called atteution to the part of the treatise ahove alluded to. By chance, the paper containing the criticism was forwarded to a relative, resident in the English Lake District, where it called forth copious remarks in several newspapers on the qualities of the Herdwicks and their adaptability for mountainous regions (of which property I propose commenting upon when the hurry of the Exhibition is over.) The origin of the Herdwicks has hitherto heen a mysterious point with me, which I believe is now likely to be cleared up hy the paragraph which appeared in your number of September 11th.

The tradition in the English Lake District is, that something more than a century ago, a vessel from Spain, on which were a large uumber of sheep, was wrecked on the southern coast of Cnmherland. Those which arrived on shore alive, having no one to look after them, took to the neighboring mountains, then solely tenanted by the "black-faced" breed. Their peculiar instincts attracted the attention of the neighboring shepherds, and about seventy-five or eighty years ago, a few commenced attempting to breed the pure race, their character in the interval having become much intermixed by crossing with the indigenous "hlack faces." One person, I know, has persevered in this matter for more than half a century prior to my leaving England, now more than fiftcen years ago; yet up to that time wholly satisfactory results had not heen ohtained, as progeny, "breeding hack," occasionally occurred.

A remarkable feature of the Herdwicks is, that *the pure breed possesses an additional rib*—fourtcen instead of thirteen. The mutton is the finest in Britain. If any correspondent would furnish your columns with information as to the numher of ribs, general appearance as regards color, horned or hornless, of the Navarre hreed, the write would feel greatly obliged.

Although Herdwicks are mentioned in one of the reports to the then English Board of Agriculture, at the closo of the last century, they did not gain general attention in recent years until the writer attracted the notice of the English general agricultural puhlic to the merits of their peculiar specialties, in a Prize Essay on "The Breeds of Sheep best adapted to different localities," which caused the Royal English Agricultural Society (according to a statement made to the writer by the late Mr. Pusey), to offer a premium for this special class, at the anuual exhihition held at Windsor during the "exhibition year" of 1851, and on some other occasiou, as the one held last month at Manchester, where it is reported some fiue specimens were shown and secured prizes.

Thomas Rowlandson.

San Francisco, Sept. 15th, 1869.

Artificial Drying of Corn.—Experiments were made in Illinois, last year, in drying corn hy hot air, and thereby getting it early to a market and obtaining the first price of that seasou. It is said the experiments have been repaid by a perfect success.

Sugar.—Our sugar bill is about $80,000,000 a year. Cuba gets most of that. When we make it from the sugar beet, Cuba will be beat.

Mechanical Progress.

Steel Fire-boxes for Locomotives.

It was thought at one time that the proper material for locomotive fire boxes had been found in copper. Iron had been found wanting; being quickly destroyed by the action of the fire and the corrosion of the sulphurous gases produced by the coal used. But copper has failed also. Half-inch sheets are in some cases found, after less than three years' service, to be reduced in thickness to one-eighth of an inch or even loss. The *Artisan* says that the Master Mechanics' Association which recently met at Pittsburg, Pa., listened to the report of a special committee on the use of steel for this purpose. In that report it was stated that on the Northwestern Railroad a locomotive has been run for eight years with a steel fire-box, which has thus far shown no signs of wear, although the coal and water had proved extremely detrimental to the copper and iron fire-boxes previously used. On the Pennsylvania Railroad are two locomotives which were fitted with steel furnaces in 1861, which still remain intact. About the same time, on the Baltimore and Ohio road, two locomotives were furnished in like manner, and with the same results—no leakage or other evidence of giving out being thus far manifest. The report concludes with the statement that "the committee decide emphatically in favor of homogeneous steel plates for locomotive fire-boxes, at least all those that burn bituminous coal; and that for boiler-plates for general construction, this material combines in a greater degree than any other the requisites of durability, safety and economy."

Bessemer Steel Rails.—The Rochester *Express* says that at one of the crossings of the N. Y. Central Railroad in that city, there are four rails which receive more wear than any other four on the road. They pass daily, by actual count, 486 engines and 3,262 cars. They have been down ten months, and are reduced only one-sixteenth of an inch. Mr. Booth, of Rochester, who has given especial attention to the matter, estimates one engine and tender equal to four cars in wear, which added to the 3,262 cars, equals 5,206 cars, or 20,824 wheels per diem, or 6,247,200 wheels for ten months. The greater portion of these cars are loaded, and much friction at this point is produced by the locking of the wheels and reversing and slipping of the drivers; at least the action is more severe than on the main track line with rapid movement, but with this ratio of wear, admitting it about equal, it will take twenty-six years for twenty daily trains, with twenty cars to a train, to reduce the steel from the first convex surface one-eighth of an inch.

The Albertype.—The London *Photographic News* thus describes the process: "A plate of glass is covered with a solution of albumen, gelatine, and bichromate of potash dried, and exposed to light until hardened. It is then again covered with a solution of gelatine and bichromate of potash, and when dry exposed under the negative, and the film is then found to possess qualities analogous to a drawing made with fatty ink upon lithograph stone. All those portions of the film that were acted upon by the light will refuse water and take printing ink, while those portions which were protected from light by the negative will take water and refuse ink. The ink and water will be absorbed by the film just in accordance with the gradations of light and shade in the negative. To produce a picture, wet the surface of the film, then apply ink, lay on paper and pass through a press; the operation being substantially the same as lithography. The process is said to be rapid, and excellent pictures of all sizes may be printed in admirable style."

Trueing Oil-Stones.—"For trueing an ordinary oil-stone for sharpening planes, take a sheet of glass paper No. 2, and lay it on the bench and rub your stone on it. In this way you can true the stone in one-quarter the time it would take in the ordinary way; and carpenters have always such means at hand. Five or ten minutes' rubbing will be found sufficient. Your glass paper will not be spoiled by the operation."

Coloring of Small Metallic Objects. M. Puschor makes a solution of 4 ozs. hyposulphite of soda in a pint and a half of water and adds a solution of 1 oz. acetate of lead in the same quantity of water. Articles to be colored are placed in the mixture, which is then gradually heated to boiling point. The effect of this solution is to give iron the effect of blue steel; zinc becomes bronze, and copper or brass becomes successively yellowish red, scarlet, deep blue, bluish white, and, finally, white, with a tinge of rose. This solution has no effect on lead or tin. By replacing the acetate of lead in the solution by sulphate of copper, brass becomes first of a fine rosy tint, then green, and, finally, of a iridescent brown color. Zinc does not color in this solution; it throws down a precipitate of brown sulphuret of copper, but if boiled in a solution containing both lead and copper, it becomes covered with a black adherent crust, which may be improved by a thin coating of wax. If the lead solution be thickened with a little gum tragacanth, and patterns be traced with it on brass, which is afterwards heated to 212 degrees, and then plunged into solution No. 1, a good effect is produced.

Bleaching Ivory.—Dr. Artus soaks the articles in a solution of carbonate of soda (half a pound of the crystals to two pounds of water) for a couple of days. They are then to be well rinsed with clean water, and transferred to a solution of three-quarters of a pound of sulphite of soda in two pounds of water, in which they must remain five or six hours. Then, without removing the ivory, a mixture of one ounce of hydrochloric acid and four ounces of water is to be added, the whole is to be stirred together, and the vessel covered up and left for thirty-six hours. At the end of this time, the solution is poured off and the ivory is to be well washed with water. So says the *Mechanics' Magazine.*

Longitudinal Sleepers for Railroads. The State Engineer of New York says in his report on railroads: "There is a growing conviction among engineers that the longitudinal system will become standard. It offers from two to three times as much bearing for the rail as the cross-sleeper system. The whole strength of the longitudinal sleeper is added to the strength of the rail, considered as a beam to carry the load. The strength of the cross sleeper in this direction is wholly wasted. The longitudinal is almost certain to prevent the displacement of a broken rail."

Iron Chimneys.—A wrought iron chimney has been recently erected at the Creusot Iron Works, 197 feet high, and 6 feet 7 inches diameter, increased at the bottom to 10 feet by a curved base, fastened by vertical bolts to masonry work. The thickness of the sheet-iron is 3-32-inch at the top, and 6-16-inch at the bottom. There is an inside iron ladder. The weight of this chimney is forty tons; it has been riveted horizontally, and lifted afterwards with a crane. Another one, 275 feet high, will soon be erected, but by a different system; it will be riveted vertically, with an inside scaffolding.

Steel Forging.—"In forging steel the secret is the temperature, and this must vary with the kind of steel required. Blistered and shear steel want more heat than cast steel; the greater the amount of carbon, the lower must be the heat at working. After cooling, the hammering should be very light, or internal fracture will be the result, not homogeneity. Let the blows fall in one direction; not at right angles to each other so as to destroy the grain. Burned steel may be brought round by heating hot and quenching in water repeatedly."—*Architect.*

Microscopic Photographs. — Pictures no larger than the eye of a small needle are now mounted in tubes resembling miniature opera glasses, and when viewed, appear of considerable size, being magnified by the glass on which they are taken. These pictures consist of portraits, landscapes, copies of documents, pictures, etc. They are intended to be worn on watch-guards, pins, rings, etc.

Another Explosive.—"The Lithofracteur" is the name of a new explosive material, invented by Mons. Krebs of Deutz, and recently the subject of experiments on a large scale at Cologne. The ingredients are kept secret. The advantages claimed are greater explosive power than nitro-glycerine, small production of smoke, and perfect safety,

Scientific Progress.

The Flaming Spark.

The *Chemical News* gives an abstract of a paper communicated to the Royal Society by Professor Popper, detailing some interesting experiments with the great induction coil,—from which we quote:

"The spark obtained from the large coil is thick and flame-like in its appearance, and will be alluded to as the 'flaming spark.' When the discharging point and circular plate are brought within six or seven inches of each other, the flaming nature of the spark becomes still more apparent. Two light yellow flames curving upwards appear to connect the opposite poles. * * *

The Dual Character of Electricity.

When the flaming spark is directed on to a glass plate upon which a little solution of lithium chloride is placed, the latter colors the flame upwards to the height of three or four inches in the most beautiful manner; and if the point of the discharge is tipped with paper, or sponge moistened with a little solution of sodium chloride, the two colors (the yellow from the salt, and the crimson from the lithium) meet each other, a neutral point being found about half way, and thus illustrating apparently the dual character of electricity, and that + passes to—electrical, and *vice versa.* * * *

Nitric Acid in Thunder Storms.

While passing through common air, if the flaming spark is blown against a sheet of damp litmus paper, the latter is rapidly changed red. In order to ascertain whether the acid product was nitric acid, the flaming spark (9 or 10 inches in length) was passed through a tube connected by a cork and bent tube with a bottle containing distilled water, from which another tube passed to the air pump; on drawing the air slowly over the spark, and passing the former into the bottle, nitric acid was obtained in large quantities, so much so that it could be detected by the smell and taste as well as by the ordinary tests. The popular notion that nitric acid is always produced during a thunder storm would therefore appear to be correct. * * *

The flaming spark has been ascribed by some experienced observers to the incandescence of the dust in the air, and especially sodium chloride. * * *

To ascertain whether the 'flaming spark' could be obtained with a small number of cells, the large Bunsen battery was reduced to three, and it was found that no appreciable spark could be produced. By reducing the length of the primary wire, and using the four divisions separately, with five cells the spark was wiry, and varied from 4¼ to 6½ inches; with 10 it was wiry, and varied from 8¼ to 9¾; in the latter the spark was slightly flaming. With 15 cells the spark was slightly flaming, and varied from 10 to 11¾ inches. With 20 cells a flaming spark varying from 11½ inches to 12½ inches was obtained."

Planetary Influence on Temperature.—Professor Pliny Earle Chase read a paper upon this subject before the American Association at Salem. An abstract of it is published in Prof. Wurtz's *Chemical Repertory.* Prof. C., who has been making observations for the Coast Survey upon the meteorological influences of the moon, found, in the forty-four years' record which has been kept at the Pennsylvania Hospital, ample evidence that rainfall and temperature were to some extent controlled by the lunar changes; and as, this being so, it was probable that Jupiter and some of the other planets would furnish corroborative indications, he arranged his observations successively in accordance with the positions of Jupiter, Venus, Neptune, and Mercury. The result, he says, was "the production of consistent curves, varying with the varying distances of the several planets, and with their positions relative to the sun. In comparing these curves an opposition was apparent between those of rainfall and temperature, which was more strongly marked than that which had been previously noticed in the lunar curves. It seems unreasonable to attribute the temperature-fluctuations to varying planetary radiation; but it is easy to understand that any influence which tends so to disturb the atmosphere, as to produce a northerly wind, should depress the temperature and increase precipitation, while one which tends to produce a south wind, increases both the temperature and the evaporation."

Period of the Sun's Rotation.

The spots on the sun are cooler than its brighter portions, and the center is warmer than the rim. The observations of Prof. Henry in this direction have been confirmed by other observers, and attempts have been made, by the study of such spots, to fix upon some meridional points in the sun's surface, by means of which its period of rotation may be determined. Prof. P. E. Chase sends the *Gas Light Journal* an abstract of his paper upon this subject, from which we quote:

"If the sun is a variable star, any permanent difference in superficial structure, however masked by the irregular disturbances to which the spots are usually attributed, may perhaps be accompanied by regularly recurring differences of temperature, which should be manifested by the thermometer. The seven years hourly thermometric observations at St. Helena (1840-7) were examined in various ways, in order to discover any traces they might furnish of cycles approximating to the supposed period of solar rotation. After testing, by the method of least squares, various assumed intervals between the limits of 25 and 29 days, the pointings were so decided and uniform, that all the observations were arranged in accordance with a hypothetical period of 27 1-14 days. The annual, semi-annual, and quarterly groupings, all confirmed the hypothesis that this was a normal interval. If we then assume 27 1-14 days for the synodical rotation of the sun, the time of its siderial rotation is about 25.065 days. This is somewhat greater than the estimates of Sporer and Carrington, but nearly accordant with the more recent estimate of Faye (25.07472)."

Great Telescopes Now Constructing. M. De La Rue is having a lens constructed of thirteen inches in diameter. Professor Henry Draper has very nearly completed a new silvered glass reflector of twenty-eight inches in diameter, the largest of the kind yet constructed, except one by Foucault. With this instrument the original negatives will be taken six inches in diameter, with provision for extending them to nine and a half inches if desirable. Professor Draper expects thus to obtain photographs of larger size than any that have yet been produced. There is now being erected at Melbourne, Australia, a powerful reflecting telescope four feet in diameter, of the Cassegrain form, which will be supplied with the necessary apparatus for photography, as well as for spectroscopic investigation.

The Nile to be Explored in Earnest. Sir Samuel Baker is to seek the sources of the Nile at the head of 1,700 men. The baggage, stores, and merchandise to be used in the trade with the natives, have already been sent on in advance. Engineers and shipwrights will accompany the expedition. Ten steamers and thirty sailing vessels will convey the expedition. Vessels will be built on the spot for the navigation of the lake Albert Nyanza. The expedition will rendezvous at Khartsum, at the confluence of the Blue and White Niles, and proceed along the latter as far as it is navigable.

The Sun Protuberances and the Sun-Spots.—Prof. Murray, one of the "Mattoon" observers of the late eclipse, after noting the fact that until the eclipse of 1868, (when for the first time the spectroscope was used to determine the point,) we were ignorant that the red protuberances, 70,000 miles in extent, were masses of incandescent hydrogen gas,—says: "That the spots which are seen on the surface of the sun will finally be proved to be identical with the protuberances I venture to predict."

Chlorate of Potassa as a Blow-pipe Test.—In the "*Neues Jahrbuch fur Pharmacie*" M. Landauer enumerates instances in which chlorate of potassa may be made useful before the blow-pipe. This salt gives up at higher temperatures some of its oxygen to certain metals, and at the same time becomes itself colored from the oxides of those metals. From *iron* and its compounds it receives a flesh color; from *lead* a pale brown; from *copper* a shade of light or dark blue, in some cases even as deep as to be nearly black. Manganese imparts a purple of variable intensity, and nickel (sesquioxide=$Ni^2 O^3$) turns it to black.

Railroad Progress.

During the continuance of the Mechanics' Institute Fair, we have found very little time or space to devote to the material progress of the State outside of the city. That pressure having now, however, been removed, we shall be able to again resume our regular routine. Since our last reference, the railroad builders on the Pacific Coast have been quite as active as at any previous time. We notice that the Pacific railroad, which for a while employed a temporary terminus,—already constructed—to Alameda, made its first landing of passengers at its permanent terminus in Oakland, on the 30th ult. The Los Angeles railway is completed. The Vallejo railroad extension is within five or six miles of Marysville. The California and Oregon road is pushing on northward from Marysville in the direction of Chico, which place it is expected to reach this winter. The first iron has also been laid on the Oregon end of the same, by the company which is to construct from the Columbia river to meet the Marysville road at the state line.

Railroads North of San Francisco.

In that portion of the State more immediately north of this city railroad enterprises are numerous, and the time is not far off when all the important agricultural valleys in that region will be placed in direct communication with this city and a market. The San Rafael and San Quentin company is making rapid progress. The residents in the Russian River valley are somewhat discouraged over the Sonoma railroad projects, which look to a continuation northward up the Russian River valley, and thence into Humboldt county. We see no reason for such doubts; it takes time and money to carry out such vast enterprises as are now in contemplation in that section of the State—and especially in a new and sparsely settled country is it necessary to "go slow," if disaster would be avoided. Sonoma will not be long without her system of railroads, an extension of which up the Russian River valley and above, will be a matter beyond the possibility of doubt.

Two Other Routes,

Connecting Suisun Bay with the northern counties between the projected Humboldt road, and the already existing Oregon route, are also in active contemplation; both of which will soon be absolutely required to meet the growing wants of farmers in those counties. Each of these must be quite or nearly independent in their business of the Vallejo and Marysville roads. The most eastern of these projected roads, which has already assumed a corporate existence, will start from a point on the Vallejo road at or near Woodland, and extend almost due north through the center of Yolo and the south-eastern portion of Colusa counties, to the town of Colusa on the Sacramento; and from thence, still north to Tehama and Red Bluffs, also on the Sacramento. At the latter point it may make a connection with the California and Oregon road from Marysville. This road will be a little over 100 miles in length, and will pass through a fine agricultural country throughout its entire length. It will also form a more direct route to Oregon than the detour by way of Marysville. The company which holds the franchise of the road is virtually the same as the Vallejo Co. Whatever may be the intent of the present incorporators, whether a bluff game to compel the Central folks to purchase the Vallejo, or whether they really mean to build, it is certain that the road *must* be built at some time—not far in the future. The success of the Vallejo road has fully proven that this northern branch, if such it may be called, must also prove a good paying investment.

The Suisun and Berryessa Road.

The second of the two roads above referred to is that known as the Suisun and Berryessa Railroad, which is an independent company, and actively at work—the first section of the road being already under contract. This road, when completed, will be 67 miles in length, and will tap a very extensive and wealthy section of agricultural country in the Berryessa and Clear Lake valleys, which is now virtually excluded from a market.

A movement is also on foot to connect Napa Valley with this road, through what is now known as Chiles' Cañon, which opens into Napa Valley at a point about ten miles above the town. The people throughout all the northern portion of the State are deeply interested in these enterprises, all of which are even now greatly needed, to open up that region to ready communication with this city and a market.

Railroads South of San Francisco.

The railroad movements to the south of this city are even more interesting and important than those to the north of us. We have already alluded to the new terminus of the Central Pacific and the completion of the Los Angeles road.

A Railroad to Santa Cruz.

The Santa Cruz people are moving actively for a railroad, and they need one. That county, though a small one, has a large, thrifty industry, and a vast amount of valuable pasture and arable land, to say nothing of its timber and fuel, all of which will soon be needed to supply this market. It is estimated that there are at least 100,000 acres of the best redwood timber in this county, yet untouched. Her forests also contain large quantities of oak and other woods. Her hills abound with inexhaustable quantities of lime. Her only market for all these productions is San Francisco. The county of Santa Cruz is second only to San Francisco in the extent and variety of her manufactures.

Three routes for reaching Santa Cruz by rail are proposed. The first to run southward from Redwood City, and after crossing the summit to descend the valley of the San Lorenzo. By this route, fifty miles of new road would have to built, nearly all the way through valuable timber. The highest elevation is about 2,000 feet, which can be reduced by a tunnel to 1,700. The second route proposed is thirty miles long, to run from Santa Clara, and across the Gabilan Ridge near the head of the Soquel Creek. The elevation could be reduced to 600 ft. by tunnelling. Soquel is the center of population of Santa Cruz county, and this route would probably accommodate the people generally better than any other. The distance from Santa Cruz to San Francisco by either of these routes is 80 miles. The third route is 30 miles long, starts from Gilroy, and makes the distance from Sa Francisco 110 miles. It is claimed that this road will bring the produce of Gilroy and northern Monterey to Santa Cruz, to be sent thence by schooners to San Francisco, in preference to going 80 miles by rail from Gilroy.

Stockton and Tulare.

It may now be regarded as a fixed fact that a railroad will be constructed from Stockton southward through the eastern portion of the San Joaquin Valley for at least 75 miles, without any unreasonable delay. Thirty-five miles of the road will be built within a year. Messrs. Stanford & Co., of the Central Co., are at the bottom of the affair, which is a sufficient guarantee of whatever may be promised in this direction. The city of Stockton aids the enterprise by the issuing of bonds to the extent of $300,000, and pays interest money that will probably amount to $24,000 annually for 20 years. This road will undoubtedly be continued to Visalia, a distance of about 85 miles further. Its construction will add vastly to the population and productiveness of the eastern portion of the San Joaquin Valley, and must add vastly to the value of all the land throughout the region which it traverses.

The southern mines will derive much benefit from the enterprise, as most or all of the travel and transportation of Tuolumne will save about 20 miles of stage road; Mariposa will save 50 miles; while the Fresno, Tulare, and Kern river travel will pass over the entire distance of the proposed railroad. This will be the cheapest piece of road for its length in the State, and cannot fail to prove a pecuniary success and a most important advantage to the rapidly growing city of Stockton. This road may and probably will eventually connect with the Northern Pacific; while another must soon be built, leaving the Stockton and San Francisco road just west of its crossing of the San Joaquin, and skirting along the eastern slope of the Coast Range to the point where the Southern Pacific will reach the Tulare Valley.

Sutro Tunnel.—Sutro has three shifts of men at work in his tunnel, and is going right along. A heading six feet square has been driven in 52½ feet, and Monday the work of cutting the tunnel to its full width will be commenced. As fast as it is finished, sets of timbers twelve inches square will be put in. The material in which they are now at work is a hard dry clay mixed with boulders. A car track was put down yesterday and cars put on.—*Enterprise, Oct. 31st.*

The "People's Tribune."

The prospectus of an "Occasional Review" under this name, has been received from Virginia City, published by Conrad Wiegand, as agent and trustee of the concern, which is to be supported "by a private non-sectarian and non-partisan association of men and women" of that burg. It proposes to give reviews of the ownership and management of the Comstock mines; to expose the "unrighteous rule of the rich" in perpetrating "robbery by legalized legerdemain;" and to give a series of biographical sketches of the public men now or heretofore prominent in connection with the history of the Comstock lode; viz: of Charles L. Strong, first Superintendent of the Gould & Curry; Woodward Palmer, of the Ophir; William Sharon, agent of Bank of California and President of the Union Mill and Mining Association; Charles Bonner, of the Yellow Jacket, Gould & Curry, and Savage; Joseph T. Goodman, publisher of the *Territorial (?) Enterprise;* Adolph Sutro, projector of a great drain and mining tunnel; William M. Stewart, United States Senator from Nevada; Thomas Fitch, Congressman from Nevada; H. G. Blasdel, Governor of Nevada; B. C. Whitman, a Judge of the Supreme Court of Nevada; C. C. Batterman, former Superintendent of Crown Point mine, and now State Treasurer of Nevada; A. W. Baldwin, United States District Judge for the District of Nevada; J. H. Latham, agent Wells, Fargo & Co., Virginia; Henry D. Lathrop, late Rector of St. John's Church, Gold Hill; Father Manogue, of the Roman Catholic Church in Virginia.

Revelations are promised touching the "marvelous conversion in a single day" of a vast multitude of brawny miners from open opposition to Chinese labor on the V. & T. R. R., by William Sharon. Contributions are invited on the litigation of the Comstock lode; on the Miners' Union of Virginia City, Gold Hill, Unionville and White Pine; the Sutro Tunnel, and on the question, "Can Comstock ores be worked to 80 per cent. by common pan process, and if yes, has Congress no right to require it?" etc.

The Last Night of the Fair.

The attendance on the last night was immense, larger than on any previous evening during the Fair. About nine o'clock, the Board of Managers proceeded to a raised platform prepared for their reception, when Mr. Hallidie, President of the Institute, opened the proceedings by the delivery of a short and pertinent speech, at the close of which he remarked as follows:

Our receipts have been, from all sources, about $61,500, and our expenses about $27,000, showing a gain on this Fair of $35,500. We carried over from last Fair a debt of $7,885, leaving us net gain for the two years of about $26,615, besides this edifice, costing in all about $45,000, and worth, if sold, about $9,000, which, if added to the $26,615, will make a total gain of $35,615 to the Society, enabling us to reduce its debt (mortgaged) about 50 per cent.; and with funds to invest in new books, chemical and philosophical apparatus, etc.

After this financial showing, Mr. Irving M. Scott, Esq., in behalf of the Board, presented the Institute gold medal to L. P. Benchley, Esq., representative of the Pacific Rolling Mill, in a few happy remarks, to which Mr. Benchley responded. Mr. Hallidie then proceeded to announce the awards, to which more particular reference is elsewhere made.

The Humboldt Register is again the title of a Nevada State journal. We have received the first number, and recognize the familiar heading; but this time it is published at Winnemucca, and by Robert McBeth and M. L. Bonnifield. Success to it.

The Daily Times has been purchased and merged with the *Alta California*. The *Times* sustained a good character during its life of some three years, and under its late management by Dr. Gunn its readers seemed to highly appreciate the paper.

Academy of Sciences.

The regular semi-monthly meeting of this Society was held on Monday evening, Prof. Blake in the chair.

Dr. Cooper reported the receipt of a large number of scientific works for the library, including exchanges and purchases by subscription. The library is steadily increasing in value, and has no equal on this coast for the specialty to which it is devoted.

Gregory Yale presented a semi-fossilized portion of a mastodon tusk from Alaska—found 400 miles in the interior. He also presented for the use of the Curators a powerful magnifying glass.

Dr. Kellogg exhibited and commented upon a number of interesting plants collected by him during a recent botanical excursion in the northern coast range, chiefly in Humboldt county. Among them was a very large and handsome species of primrose, the petals of a rich dark purple. It was originally found and determined by Prof. Bolander, Botanist to the Geological Survey, and named after Prof. J. D. Whitney. Another notable plant was a peculiar species of ceanothus, which had the flavor of birch, and, when browsed upon by cows who are very fond of it, increases the cream in their milk by 25 per cent. Dr. Kellogg stated that this quality in the Humboldt ceanothus is so well known that it gives a special value to pasture lands where it is known to abound; and he mentioned one instance that came to his knowledge of a dairyman selecting his land with reference to the abundance of this plant. Its habitat is all along the coast range, at least as far south as Santa Cruz.

Some conversation ensued relative to other species of the ceanothus, and the fact that the leaves of this family generally resemble tea in taste was referred to—a fact which has been discovered by the Chinese, who are known to make a sham tea from the ceanothus leaves collected on the peninsula of San Francisco. Dr. Gibbons mentioned that the plant from which the American colonists made a substitute for tea during the revolution was the *Ceanothus Americana.*

Mr. Yale called attention to the expected recurrence of meteoric showers, so called, during the present month, and described two meteors that he saw simultaneously a few nights since. He had seen the great shower of 1833.

A New Pavement.—The Fiske Concrete Pavement is the name of a new invention which is being tried and highly spoken of in New York,. If this pavement has the advantages claimed for it, it will probably be used in San Francisco, and fill the bill of our requirements. The process of laying it is thus described:

The pavement is first swept clean, and all dirt removed from the crevices. It then receives a coat of pine tar, after which a layer of coarse concrete, two and a half inches thick, composed of gravel tar and resin, is spread over the stone base and made smooth and level by means of a stone roller, weighing 4,500 pounds. Then comes another layer, two inches thick, of fine gravel concrete, which is rolled out in the same manner. The whole is covered with a thin coat of sand to fill up the interstices and render the surface compact. The heat of the sun causes the evaporation of all the alcoholic properties of the tar, and permits the composition to harden and become as solid as stone. A section of the pavement that has been laid two weeks is already as hard as stone and perfectly smooth. Several experiments were made to test the solidity of that portion which had been finished ten or twelve days. One of the workmen was directed to strike it with a thirty-six pound maul, repeated blows of which produced no effect, not so much as a slight indentation. The ordinary paving stone was shivered to atoms by one stroke of the same hammer.

English Iron and American Railroads.—The demand for English railway iron in the States still continues on a great scale. In August we sent to the United States 25,548 tons of this description of iron, against 23,250 tons in August 1868, and 12,890 tons in August 1867. The increase in the figures for August was not very material, but in the eight months ending August 31st, we sent to the United States 229,145 tons of railway iron, against 188,730 tons in the corresponding period of 1868, and 125,551 tons in the corresponding period of 1867.—*Colliery Guardian, Oct. 8.*

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, November 5, 1869.

Financial.

Considerable sensation has been created in financial circles by the telegraphic announcement that Secretary Boutwell meditated a grand *coup de finance* on the 1st of January next, by a sudden and violent resumption of specie payments. If such a move be predicated on the surplus coin contained in the Treasury, it will terminate in wide-spread disaster; but it is possible that sufficient funds for the purpose may be obtained from European capitalists anxious to invest for a long term in the best existing securities, and at a higher rate of interest than can ever be procurable in Europe. The credit of the United States Government is too solidly established to be shaken now by twaddling politicians who have heretofore been vocal in the cause of repudiation, either in whole or in part. The nation has spoken, and given those men their quietus, while the honorable and meritorious policy pursued by the American Government and the enunciations of Congress have entirely dispelled all doubts as to our ability and desire to pay every obligation in the most honorable manner. The convention of leading merchants and business men, gathered from all parts of the country, which lately met at Louisville, Ky., gave emphatic expression to their views on the question of finance. Although they did not advocate immediate resumption of specie payments—because the thing is clearly impracticable, if it is to be done on our own unaided resources, yet they did the next thing, in recommending the withdrawal and destruction of legal tender notes as fast as the net income of the Government will permit, and the substitution of free banks, whose notes shall be issued only as fast as the legal tenders are withdrawn from circulation. With free banks, whose issues shall be predicated on coin basis, supported by Government bonds, and the steady retirement of Government notes as fast as the net income of the country will permit an early return to the condition of things which prevailed before the war would be easy and safe. Every interest in the Union is suffering from the fluctuating and uncertain values of the thing called paper money, and every interest is anxiously looking for the development of some plan by which fixed values shall be attached to paper currency. With $300,000,000 in coin in the Treasury, the work could be done very soon, without causing the least financial distress. The holders of greenbacks would scarcely press their redemption, because they would then be worth their face, as they could be redeemed at any moment, and are more convenient than coin. In our opinion, it is not at all unlikely that the Secretary may have determined to rid the country of its financial nightmare by hiring the use of a couple hundred millions from European capitalists at a comparatively low rate of interest. It is plain that something definite must be done, but no decisive action can be taken until Congress assembles and adopts a well-considered policy. The mercantile, manufacturing and agricultural classes have all expressed their views, and the question has been discussed from almost every conceivable stand-point, throwing floods of light upon it, and instilling much sound and practical sense into the heads of our national legislators. Under any circumstances, the country should be prepared for so momentous a change, by specifying some date upon which it shall take place, and giving ample time for business men of all classes to make suitable arrangements.

Rates in bank are 1@1½ per cent. per month, and outside accommodations are obtainable at 1½@2½, according to the security. The savings and loan institutions are not letting their money out very freely, but the demand has also lessened. Some vagabond libellers, having had their little quantum of brains addled by the no less vagabond twaddle of George Francis Train, endeavored to create a vague impression that wide-spread financial distress threatened this community, and this mischievous rumor has been sent far and near. Among other entirely unfounded reports was one affecting the Bank of California. This institution has a gold, paid-up capital of $5,000,000, and has 174 stockholders, who are actually worth $40,000,000, each of whom is, by the laws of California, personally and individually liable for all obligations assumed by the Bank of California. It has earned a surplus of $1,500,000, which, with the original capital, makes a cash fund of $6,500,000. Its assets are above $12,000,000, and its interest collections amount to $90,000 per month. Of the $9,000,000 out on loans and discounts to merchants and other business men, at least $5,500,000 are collectable on call, while its indebtedness to depositors only amounts to $3,000,000. The falsity and malice of the reports so loosely spread are only equaled by their supreme folly.

The operations of our Branch Mint for October were as follows: Double eagles, $1,580,000; eagles, $129,300; half dollars, $60,000; total, $1,669,000. The gold deposits were 89,124 ounces; silver, 57,038 ounces, of which 27,813 ounces were in Japanese coin, sent here for re-coinage. The transactions for the past ten months, as compared with those for a like period in the preceding two years, are shown in the annexed table:

Ten months.	Coinage, Amount.	Gold Deposits, Ounces.
1867	$15,826,535	739,131
1868	12,348,000	699,658
1869	11,232,000	679,435

The City Treasury is in a plethoric condition. At the close of October, $1,147,876 were in that lock-up.

The real estate market is rather quiet. Those who own desirable properties are not disposed to part with them, nor is there much anxiety shown to purchase, except in special localities. The number of sales made in October was 876, involving $1,631,260. Mortgages were effected to the number of 179, representing $706,574, and there were 111 releases, to the aggregate value of $302,200.

City Stocks.

No sales of miscellaneous stocks were effected in the Board during the past week.—The usual monthly dividends of the various local incorporations are as follows: Spring Valley Water Company, ½ per cent., payable on the 10th; North Beach and Mission Railroad, ½ per cent., payable since the 1st; San Francisco Gas Company, ¾ per cent., payable since the 1st inst. Sacramento Gas Company, ½ per cent., payable at the office of Wells, Fargo & Co., since the 1st of November; Merchants' Mutual Marine Insurance Company, 1 per cent., payable on the 10th; Pacific Bank, 1 per cent., payable since the 1st inst.

Mining Share Market.

We report a very fair business in the Stock and Exchange Board since our last issue, prices having been quite well maintained. There is apparently a better feeling among outside dealers, who manifest a greater degree of confidence, as exhibited by their increased investments. Considerable sales of White Pine stocks were made within the past week, the amount per share of several companies being low, while one (the Original Hidden Treasure) has been well maintained. At the close, a general improvement is noticeable.

The sales in the San Francisco Stock and Exchange Board during the month of October for the past five years have been as follows:

October, 1865	$4,000,500	October, 1868	$10,519,442
October, 1866	1,375,117	October, 1869	3,543,535
October, 1867	5,170,942		

Joseph Tilden has been elected Caller of the Stock Board, at a salary of $100 per month.

CHOLLAR-POTOSI—sold to a large extent at an advance. During the week ending October 29th, 1063 tons of ore were mined, against 872 the previous week. While there is no increased production since our previous report, we note a slight improvement in the quality. The Blue Wing stope is reported to look promising. On the first instant they sent 110 tons of ore to three different mills for reduction.

OPHIR—was in the market to a considerable extent, selling at uniform rates. On the fourth instant a telegram came to hand, as follows: "Have got the water from the old mine; drift and shaft filling up rapidly." On the 2d instant the main drift had been extended a distance of 763 feet, and the south-west drift 198 feet. An assessment of $2 per share was levied on the 29th of October.

OULD & CURRY—shows a slight improvement under limited sales. For the week ending November 1st, 374 tons of ore were extracted, against 427 tons the previous week. No material change is noticeable in the general appearance of the upper mine. The drift running south from the seventh station has porphyry and clay and a slight flow of water. The north drift is in clear, hard porphyry. The El Dorado Tunnel, west of the Seneca Branch, is closed—27 feet having been cleared out since the 25th of October.

SIERRA NEVADA—was in good demand during the period under review. This mine is reported to exhibit considerable improvement. On the 2d inst., $7,132 in bullion was sent forward to the office in this city.—OVERMAN has been receiving a considerable amount of bullion lately. They extract about 100 tons of ore daily.—CONSOLIDATED VIRGINIA levied an assessment of $1 50 per share on the 3d inst.

HALE & NORCROSS—met with rather free sales at an advanced price. During the week ending October 30th, the upper mine yielded 250½, and the lower 796¾ tons of ore, making a total of 1,047¼ tons, against 1,259¼ tons produced the previous week. On the sixth level, they are now 70 feet north of the station with the north drift, and 46 feet south with the south drift. When the north drift is carried 20 feet farther, it will be directly underneath the winze now being sunk from the fifth level, and they can then develop 160 feet in length of vein by making three cross-cuts westward through the vein. The winze is now 18 feet in depth, and is being sunk in the porphyry east of the east clay wall, in order to avoid the water in the vein, which will be drained off so soon as the vein is cut in the level below.

EUREKA (Cal.)—From the report of this Company for the year ending September 30th, we learn that the bullion product amounted to $563,688, and the dividends disbursed to $264,000. The ore extracted was 21,526 tons, and the amount reduced, 20,588—showing an average yield of $27 80 per ton, and costing $9 65 to mine and mill. From October 1, 1865, to October 1, 1869—a period of four years—the bullion returns aggregated $2,152,389, and the dividends disbursed during the same time, $934,000.

In reference to White Pine claims, we take the following from the *News*, dated October 30th:

ORIGINAL HIDDEN TREASURE is taking out 20 and sending to mill 25 tons of ore daily. Very little assorting is required of the ore taken from the breasts in the south shaft, which are being vigorously pushed. The north shaft, sinking through high grade ore, will reach the tunnel level within three weeks; and the tunnel, now in 60 feet, with a full face of ore, will connect with the shaft in about five weeks. The suit pending between this company and the Ruthburn, for a matter of 200 feet of ground, has been set for hearing in the District Court, November 22d.—AURORA CONSOLIDATED is sending to mill 75 tons of ore per day, of which 55 tons are reduced daily by three mills, giving an average yield of $59 per ton. This company will be in condition to pay regular monthly dividends from $1 to $1 50 per share from the beginning of 1870, or $16,000 to $24,000 per month. The track and dump at the tunnel have been completed, and the southern portion of the mine is yielding handsomely. The north breast in the Earl shows a marked improvement in quality, and the immense body of ore developed in that part of the mine appears to be widening and deepening as it is followed into the hill.—NOONDAY is piling up a large quantity of good ore at the north shaft, which is taken from the south drift, 55-foot level.—MAMMOTH levied an assessment of twenty cents per share on the 28th of October.

DECREASE IN TELEGRAPH RATES.—The Western Union Telegraph Co. has made a most important reduction in their telegraph rates to various points on this coast and in the State of Nevada. The reductions are from 25 to 60 per cent. No change, we believe, is made in the overland rates; but we presume a reduction in that direction will also be made, if the home reductions should prove a financial advantage to the Company.

NOBODY said they would give sight to the blind; yet Muller's Brazilian Pebble Spectacles will certainly improve the seeing of any one who has any eyesight at all left. *

Advertise Rightly and You will Surely Profit by it.

THE MINING AND SCIENTIFIC PRESS is the best and cheapest advertising medium in the Pacific States for

Advertising Mining and Farming Inventions, Machinery and Implements, Tools for Workshops, and all Industrial Pursuits on the Coast, and in fact, all matters which advertisers wish to have known to the most intelligent and industrial classes throughout this Coast.

The Mining and Scientific Press is printed in superior style on fine paper, and great care is taken to display advertisements conspicuously and in good taste.

A large edition of the Press is bound in Monthly Parts (pamphlet form) and also a large edition in Quarterly Series (stiff binding); which are furnished to hotels, libraries, reading rooms, ferry boats, bay, river and ocean steamers, R. R. depots, etc., throughout the Pacific Coast. Our advertising columns are the best patronized of any weekly paper west of the Rocky Mountains. Our advertisements are longer continued than those of any other paper. As to the value of the Mining and Scientific Press as an advertising medium, we refer to our list of patrons. No paper in the world has a better class of intelligent, reliable customers.

DEWEY & CO.,

Publishers and Patent Agents, 414 Clay street.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Improving.—*Miner*, Oct. 23d: The ore in No. 3 tunnel of the M. C. M. Co. is improving steadily and constantly, both in quantity and quality. Several tons of pay ore has been taken out this week, which shows unmistakably that this is upon the true south continuation of the Tarshish ore deposit. The Tarshish, in length and breadth, as well as in richness, in our opinion exceeds the Comstock.

Billy Rogers Claim.—*Chronicle*, 23d: The 10-stamp mill at White Rock, El Dorado county, has been purchased by Supt. Barnee of the Billy Rogers claim, in Hope Valley, but will not be erected until next spring. They have a mammoth ledge of paying ore. The successful working of the Billy Rogers claim will give an impetus to mining in the Hope Valley District.

CALAVERAS COUNTY.

Rich Rock.—*Chronicle*, Oct. 30th: Rock of extraordinary richness has been discovered in the Palomo mine. We are informed that $150 worth of gold was extracted from about as much rock as would fill an ordinary nail keg, and that there is a large body in sight of equal richness. The shafts have attained the depth of 250 feet, and are being sunk as rapidly as possible. At the same time a large force is engaged in stoping, keeping the battery of 16 stamps crushing day and night. The last clean-up left a handsome surplus over expenses.

EL DORADO COUNTY.

Quartz Mining.—Placerville *Democrat*, 30th: About a year ago, Dan. Miller discovered a quartz ledge on Mound Spring Creek, 3½ miles southwest from this city. Mr. Miller and two of his sons have been sinking a shaft, which furnishes indications of one of the most valuable gold-bearing veins ever discovered in this county. The vein has an average width of two feet, and every particle of the rock seems to contain gold, and as far as tested will yield from $25 to $100 per ton. The rock is soft and easily crushed.

LOS ANGELES COUNTY.

Soledad.—Correspondence of the *Alta:* "The Eureka is the pride of the district. It is a well-defined ledge, and averages $20 per ton in the mill. A year ago, Polk & McClellan, who owned the Deyeman & Saratoga, put up a 10-stamp mill, and Searles & Yates, a mill with five stamps, both of which were run by water. About this time Clark & Gleason, the owners of the Eureka and Amazonia, parted with a portion of their mines with Jas. A. Hayward and others, upon certain conditions. At this time the Mexicans had sunk a shaft on the Eureka mine 60 feet, and were taking out picked rock which averaged $47 per ton. Hayward & Co. at once suspended the Mexican job, and sunk a shaft 175 ft., and run a level 120 feet, the rock—good, bad and indifferent—yielding an average of $20 per ton. Last spring a combination took place, in which all of the interests in mills, mines and property, were merged in the names of Hayward, Polk, Clark and several others, who styled themselves the Eureka Mining Company, and erected a splendid steam stamp mill. They have a shaft down nearly 200 ft. At the end of the 100-foot level, a few days ago, a ledge was developed nearly six feet in width, showing fine specimens of rich quartz. This company own their hoarding houses, teams, and all the paraphernalia of a mining camp, valued, outside of the mines, at $75,000. The Zepata mine, of Dr. Winston, in the San Fernando Mountains, has in spots ore which will assay $400.

MONO COUNTY.

Struck It.—Carson *Appeal*, Oct. 26th: Senator Nye and Dr. Munckton have returned from a visit to the Dunderberg mine, on the East Fork of Walker river, owned by the Doctor. He has for a year or more been running a tunnel to the ledge. While he and the Senator were there, a blast of giant powder revealed the long-sought lode; and some specimens which were shown to us are the best evidence that the Doctor has been amply rewarded for his outlay. The ledge, which is very wide, has been found at a point some 250 feet below the croppings.

NEVADA COUNTY.

The Mines.—Grass Valley *Union*, Oct. 28th: We hear good reports from almost all the mines in this district. The Empire Co., on Ophir Hill, has a large ledge, and the rock shows well in free gold and heavy sulphurets. The Allison Ranch mine never looked better. The ledge shows well in rich rock. Ore is being crushed from the old ledge. The Pittsburg mine is paying considerable over expenses. The North Star had a clean-up last week, and we learn that it was largely over all expenses of the company since their reconstruction. There are hopes that the Coe and the Betsy mines will start up early in the spring.

Empire.—Same of 31st: Splendid rock is coming out of the eighth and ninth levels. In the shaft which is being sunk for the tenth level, the ledge is large, and carries free gold and heavy sulphurets. In the Rush & Laton ground, the incline is down 360 feet and two levels have been run, both showing good rock. The next month will set all things right.

Eureka.—"For the year ending Sept. 30th, the Eureka produced $572,600 from 20,638 tons of quartz—an average of $27.80 per ton, and the net profit per month about $30,000. The chloriuation establishment belonging to the mine reduced 137 tons of sulphurets, and obtained $23,532.52, or $171 per ton."—*Alta.*

The Ben. Franklin.—*National*, 27th: From a crushing of 51 loads of rock made at the Sebastopol mill in Boston Ravine, a few days ago, over $2,100 was realized. The rock was taken from the top level, 30 feet from the surface. The ledge varies from 6 inches to 4 feet in thickness.

Large Nugget.—Same of 29th: Mr. Wells found a nugget on the south fork of Steep Hollow, a few days ago, weighing 17 ounces. It is worth about $300.

North Star.—Same of 30th: W. H. Austin, from French Lead, informs us that the new 16-inch pump will be in position and ready for work by the middle of next week.

Hydraulic Mining.—*Transcript*, 28th: The prospect is that there will be a great deal of hydraulic mining in this county as soon as there is water. One company was formed a few months since, and 1,700 feet of ground was taken up on the Blue Tent road, which has never been worked before. A prospect of 50 cents to the pan was obtained from the claims. They have everything ready to work to good advantage. If this Co. is successful, we shall hear of lively times. There is ground enough in that vicinity to last for years.

Specimens.—28th: We were shown yesterday some most beautiful specimens, mostly gold, from the diggings of Shively & Co., Moore's Flat. The largest piece was valued at $30, and the others ranging from $1 to $10.

Mining Location.—31st: The New Bavaria Co. have taken up 1,000 feet on a quartz ledge one mile from Rush creek. The Co. sunk down 12 feet, and struck a splendid ledge one foot thick. The rock is rich in sulphurets, and shows some free gold.

PLUMAS COUNTY.

Big Clean Up.—Quincy *National*, Oct. 23d: We are informed that the last clean up at the Crescent mine in Indian Valley, for ten days' run, yielded over $6,000.

SAN BERNARDINO COUNTY.

The New Mines.—Cor. San Diego *Union*, Oct. 27th: There is nothing talked of in San Bernardino, except the placer diggings lately discovered 30 miles northwest from this place, and 15 miles beyond the Lytle Creek mines. There are a good many parties out prospecting. These mines are doubtless rich, but whether they are extensive is not yet known. I know one company that has been making $20 per day to the hand.

SIERRA COUNTY.

Will Start.—*Messenger*, Oct. 30th: Ned Leonard has his quartz mill nearly ready for running, the water having been let on the wheel Monday. He has about 200 tons of rock out, and will commence crushing this week.

Mohawk Valley.—Cor. of Truckee *Tribune*, Oct. 30th: "The company owning the iron mine at this point have started work as though they meant it, building smelting furnaces, and other necessary buildings. The gold and silver mines are being prospected with very flattering results, the gold mines yielding from $5 to $12 per day, coarse lead gold."

SISKIYOU COUNTY.

Old Placers Re-Discovered.—Yreka *Union*, Oct. 23d: In the mountains, 20 miles south of Adin, Big Valley, they have discovered a creek, the bed of which has been mined for two or three miles, at some former period. Curiously enough, there is a man now in Big Valley, but recently from Wisconsin, who says he worked on that creek in the spring of 1853, and took from it six pints of gold dust. In the vicinity is the quartz ledge of which we spoke two or three weeks ago. Dr. Ream has shown us a piece of quartz from it which abounds with gold.

TRINITY COUNTY.

Lower Trinity.—Trav. cor. of the *Journal*, 30th: Near "Don Juan's Point," Mr. Pelletreau has a number of Chinese employed in opening a claim which had every indication of paying. There are a great number of bars along this part of the river and some water privileges lying idle. The nature of the country is such, however, that very little ditch could be dug. Fluming would have to be resorted to, and lumber is hard to get. At Taylor's Flat, and on Corral Bar, opposite, some mining is being done. There is a good ditch from French Creek to the former place. From this point to Cox's Bar is eight miles. Here there is more mining being done than on all the rest of the river below North Fork, and the claims have a high name.

Weaver Creek Flume.—During the week the company finished putting in boxes for the season, and are now building dams to secure the flume from injury by the winter freshets.

TUOLUMNE COUNTY.

Mining.—Sonora *Democrat*, 30th: We are satisfied that much larger quantities of gold are being taken out in this county than is made known to the public. It has been stated to us that more than $10,000 has been taken out of one vein within half a mile of the city line within the last three months, but it has been kept secret by the parties. The miners of Brown's Flat are doing well, several claims are paying rich, but we are not able to get the amount taken out. Munn's claim, on the Tuolumne River, which was filled during the late storm, has been freed from water, and is now yielding largely. Knox & Boyle's mill was cleaned up last Saturday, and yielded $1,465. The Confidence mill was also cleaned up after two weeks' run on Saturday, and turned out $5,000.

Arizona.

From Big Bug.—Prescott *Miner*, Oct. 16th: Messrs. Gray, Jones and Wunderlich got back on the 14th, from Big Bug with the best kind of mining news. Mr. Heslep had run through and cleaned up five tons of refuse ore from the Independence mine, which yielded twenty-two dollars and fifty cents per ton, in free gold. Taking the yield per ton, of the first-class ore which was worked in an arastra a short time ago, by T. W. Boggs, and adding it to the result obtained by Mr. Heslep, we have an average yield of thirty-six dollars per ton. The company are taking ore from two lodes, and have about seventy-five tons out, which they feel confident will pay from $20 to $30 per ton. Some twenty men are at work at the mill in the mines. New roads have been laid out, lumber to build houses for the workmen has been ordered, and it looks to us as though the company meant business. Mr. Heslep has made many improvements on the mill, and we predict that the enterprise will be a success. We thank God for at last sending us a millman that knows how to save free gold!

The Prospecting Parties.—A part of the Miller party returned here this week. The remainder stopped behind, at Bill Williams' mountain, to hunt and prospect. We have not seen Mr. Miller, the leader, but learn that he went down the Little Colorado about 150 miles below, and saw no evidences of gold. When last heard from the Jackson party was at Hat mountain, 160 miles southeast of Prescott, and had not found diggings.

Colorado.

Ward District.—Central City *Register*, Oct. 14th: The Ni Wot, Long's Peak and Edgehill mills are all at work steadily. The percussion tables are doing their work well. The concentrated ore assays from three to six ounces per ton, and a large quantity has accumulated.

Krom's Concentrator.—Mr. Bela S. Buell sent 183¼ lbs. of common mill ore, from the Briggs mine, to be crushed and concentrated by Krom's Dry Concentrator. The Manager reports 32 lbs. of concentrated ore, 33¼ lbs. of dust not separated, and 118 lbs. of gangue. The samples sent are perfectly clean, and the dust not separated appears much richer in mineral than the original ore. Those who have witnessed the operation, say that the machine is a success. The crushed ore is at first screened, making three sizes, then each size is worked by itself.

Rising Sun.—Same of 21st: Mr. McCaskill reports that he and his associates have eight feet of pay rock.

Mills.—Mr. Jones has put up his steam stamp mill at the Manhattan and has it running nicely, each stamp making 150 drops per minute.....We understand that the Black Hawk Co. are taking out one section of twenty stamps, with the intention of putting in 25 lighter stamps in their place....The Franklin Company's new mill will be in running order in a few days.

Smith & Parmelee.—*Herald*, 20th: The strike is ended. From fifty to one hundred men are employed. Within the past few days nearly all of those who had refused to work, came back and offered their services. Some of them were re-engaged, but oftener their places were filled with new men.

Nevada.—The Sullivan Mill will resume work on ore from the Quartz Hill, on the Burroughs lode. The twelve stamps of this mill have been all Summer pounding away ou ore for this company. Chatfield is running his mill on Kent Co. ore.

Items.—Logan and Finley will start up the Holdbrook mill, North Clear Creek, on Monday, on Nevada ore. The University mill is being run by George Wells on ore from the Burroughs lode. A week ago Messrs. Holmes & Daws leased the Hurd mill, and have since kept its 30 stamps employed crushing rock from the Bates & Baxter claim, with good returns. In Chase Gulch, Tomlinson is running the old Holman mill (12 stamps) with Kip and Buell ore. J. V. Kimber keeps 25 stamps at work for Stalker & Standley. He shut down the Empire mill yesterday. Mr. Stevens is crushing Bob Tail ore, from the Sterling claim, at the old Gaty mill, and obtains a yield of from 5 to 20 ounces per cord.

New Reduction Works.—It is rumored that Stuart is about to organize a company for the purpose of building reduction works of twenty tons capacity per day, to be located in Georgetown.

Items.—Georgetown *Miner*, 21st: Mr. Symington is sinking on the vein in the Baltimore. We learn that the ore improves in depth....The Equator is yielding a large quantity of second class ore that is producing more silver than any previously....At the Marshall tunnel they have been testing single hand drills and Giant powder, the results being satisfactory....A day or two since we saw a fine bar of silver bullion, weighing 1500.2 ounces, .795 fine, coin value $1,542.06. It was from Equator ore. ....We are informed by Fred Clark that he has obtained the enormous yield of $30,964.44, per ton of 2,000 pounds, from a selected specimen of black sulphuret ore from the Terrible mine....Jacob Snider is sending Snowdrift ore to Bateman's chlorodizing works, at Mill City....Recent assays from crushed and sampled ore from the drift in the Brown mine, gave an average assay of over 400 ounces of silver to the ton. From present indications this company will ship not less than a thousand pounds of silver bullion next month.... On Monday, work was commenced on a cross-cut to tap the Grand Trunk lode, on Brune Mountain, at a depth of fifty feet. The ore from this vein shows, by assay, a yield of from 65 to 806 ounces of silver to the ton.

St. Joe.—This vein, on Sherman Mountain, 1,800 feet above the valley, excels in massiveness of outcrop all other veins in the Territory. Shaft, 23 feet deep; pay vein at that depth, 14 inches.

Tom Thumb Lode.—Crevice 8 feet wide. Discovery shaft, 20 feet deep. It yielded 1,000 pounds of ore which sold for $389 in currency. This work has all been done in 14 days. Select specimens of ore assayed from $1,200 to $3,000 per ton.

The Par Lode.—A sufficient amount of work has been done on the lode to warrant the belief that the Par is a true fissure vein, carrying a strong deposit of very rich ore. A number of test runs have been made, which show that the first-class ore is worth $1,000, coin value, per ton of 2,000 pounds. We are creditably informed that the average ore, by fire assay, is $669-.72 per ton. Three assays of selected ore, made respectively by Professors Martine, Hoyt and Brown, yielded $2,211.51, $2,-412.08 and $2,359.50, coin value, per ton.

Idaho.

Ida Elmore.—*Avalanche*, October 23d: Through the politeness of Mr. Caldwell Wright, Clerk of the Co., we are furnished figures, showing the number of tons of ore crushed, and the average per ton, from the opening of the mine up to Aug. 1st—the date of incorporation: Tons of ore worked, 7,020; gross product, $740,865.05; average per ton, $105.53¾.

Rich Ore.—A large body of extraordinarily rich ore has been struck in the Golden Chariot.

The Keystone ledge on Long Gulch, recently discovered by Sayres & Firebaugh, is reported turning out well.

Poorman.—*Wave*, 28th: The mine, at a depth of 50 feet below the 400-foot level,

where a drift is run six feet each way from the shaft, shows better evidence of permanence than ever. They find a good sound ledge with perfect casings, and proof that the ledge has changed its dip from west to east, indicating that by some convulsion a break has occurred at that point.

NORTH IDAHO.—Cor. of *Statesman*, 21st: Elk City, Clear Water Station and Newsom Creek are full of busy Celestials. John has helped us out. The ditches and mines are now in the hands of a few. Those few prosper. I advise no one to leave this basin to go there. Warren's Diggings have not paid as well as formerly; in fact, nothing has been realized there. I still think the camp will come out right with plenty of water. Florence has been better. Laborers in the mines receive $5 per day, gold. But few are employed, however, most companies being large enough to do their own work.

LOON CREEK.—Oro Grande correspondence of same, 23d: The Yellow Jacket excursionists have returned, sore. Uncle Nate says the ground was salted. On Loon Creek, the claims are, as before, paying well;—no new strikes. Those who have no claims are making preparations to leave.

Montana.

NEW STRIKE.—Helena *Gazette*, Oct. 22d: Mr. Eads has struck good placer diggings in Eads' Park, two miles to the left of the Blackfoot trail. He has got 10 cents to the pan, and there are about 25 claims which promise to pay well. There will be plenty of water in the spring. The ground is laid over till the 14th of May.

PIPESTONE.—Geo. Smith, Mr. Taylor and Pete Brown are making $10 per day to the hand. I prospected three pans of dirt; the prospect weighed 45 cents. This company has claims that will last them for more than another season. I was informed that Mr. Parsons, Dick Craig and several other companies were starting up, all in fine spirits. Below the cañon, McDougal, Cook & Co. are commencing to operate successfully, after building an extensive dam and flume. The Belcher & Wood ditch and diggings are a success. It is considered that they have diggings that will last for years. On Little Pipestone, C. Cook & Co. have commenced to work again, but water is yet slim.

A NEW DITCH.—*New Northwest*, Oct. 22d: An able and energetic company has surveyed a ditch from Race Track to the rich country around the Gold Creek Mountains. It will be 6 or 7 miles long, and cost $25,000. It will be completed early in the spring.

Several companies are sluicing in Peterson Gulch, getting a fair yield. Water is wanting.

Nevada.

COPE DISTRICT.

LATEST FROM COPE.—Elko *Independent*, Oct. 27th: From the Argenta and Hamilton, ore of high assay value is being shipped to San Francisco for want of facilities to work it at home. Some of the ledges that have been exposed are very wide; among those, are the Buckeye, California and Idaho. Very rich croppings have been taken from other undeveloped locations.

Robert Paxton writes the *Enterprise* on the 22d, that he has been in Cope 2½ months, and located half a dozen leads, which excel any croppings since the early Comstock days. At ten feet depth, the ore will pay $150 per ton. John Atchison and others have a fine 10-stamp mill on the ground and partially up. Another mill is en route, which will be running by the 15th of December. The beauty of our ores is, they are easily worked.

BULL RUN.—*Independent*, Oct. 30th: The Porter is the representative mine. A few days ago a quantity of ore was taken below and worked by pan process $716.31 per ton. On Wednesday, Bradbury's pack train brought in three tons, which is consigned to San Francisco, to be reduced. It is expected that this lot will yield $1,000 to the ton. As yet a depth of only 25 ft. has been attained.

RAILROAD.—Pierson, Seamands & Cox are only down some six feet on the ledge, and have three feet of ore that pans out well in silver.

COPPER AND SILVER.—We were shown some samples of ore from the Josephine mine, Railroad District, yesterday. One piece had been melted down in a forge, and was a malleable lump of copper and silver. The mine is ten miles from the railroad, at Palisade.

HUMBOLDT.

BATTLE MOUNTAIN.—*Independent*, Oct. 30th: A new discovery called the Toledo, has been stripped 40 feet in width. The ore assays 30 per cent. in copper, $80 per ton in silver, and $10 per ton in gold. It is seven miles from the railroad. The Little Giant mine, which has produced a large amount of silver during the past year, is distant ¾ of a mile.

LITTLE GIANT.—Cor. Humboldt *Register*, Oct. 30th: G. W. Fox, who is now the sole owner of the mine, keeps his mill running day and night on ore that yields $150 per ton.

THE TRENTON has a shaft 65 feet deep, and a tunnel 150 feet. The tunnel exposes a vein averaging 30 inches in width its entire length, and the ore assays $400 per ton. They have shipped 15 tons for reduction.

DUCK CREEK.—We have quite an excitement occasioned by the discovery of large veins of argentiferous galena. This belt of ore extends a mile and a half in length, assays $200 in silver, and contains from 40 to 60 per cent. lead. The Avalanche will commence shipping ore in a few days. The Shiloh is turning out large quantities of ore which pays $175 per ton as per last shipment.

BUENA VISTA SERIES.—A tunnel is being run to cut the several veins at considerable depth, and if the ore is as good below as on the surface, a large quantity can be obtained worth $150 per ton. These are the first silver-bearing veins discovered in the district.

GOLCONDA.—We learn that this mine is looking well. It employs 25 men. The company is running its mill by steam power, and making regular shipments of fine bullion. A large quantity of tailings has accumulated, which pays handsomely. Each shipment averages about $4,500. A fine vein of ore several feet wide has been struck on the third south extension.

GOLD RUN DISTRICT.—A San Francisco company has purchased the Cumberland mine, of Charley Hassen, and is preparing to commence active operations next week with a force of ten miners. They intend to ship the ore by railroad to San Francisco for reduction. The Tartar mine has been sold to a New York company.

UNIONVILLE.—The Arizona mine continues to improve in richness. The Fall & Winter and Silver Mining Co's claims on this lead have yielded daily, during the present month, 100 pounds of fine bullion. This is exclusive of shipping ore, which is in itself sufficient to pay all the expenses of both companies.

ARIZONA EXTENSION.—The owners of the first North Extension, adjoining the Fall & Temple claim on the Arizona ledge, have succeeded in discovering the ledge, and expect in a few months to have a mine developed equal to the original location.

MINERAL HILL DISTRICT.—The *Reveille* of Oct. 30th, says: A person who arrived here from Mineral Hill this morning, told us that about one hundred men would stay here this winter, all well "fixed" for any weather. The principal work was done by Ward & Co. and the Austin Co., both of which are taking out ore for shipment to this city for reduction. Parties of men were engaged under contracts in opening certain claims. Those interested, anticipate that it will be a lively district next spring.

REESE RIVER.

CORTEZ DISTRICT.—*Reveille*, 23d: Wenban & Co. are working small parties of men in their St. Louis, Garrison and Artic mines, all of which are producing good ore. At present the mill is kept running during daylight only.

EUREKA.—Same of 25th: Letters received yesterday state that a party is about to build a Mexican smelting furnace, known as a "basso;" and that the original furnace, which was stopped a short time ago, was to be fired and charged at once. The letters also state that Col. Avery is about to erect a 10-stamp mill.

SILVER PEAK.—The company is now in a prosperous condition. Shipments of gold bullion from Red Mountain are made to San Francisco at short intervals; while ore is constantly accumulating. The property in mines embraced about 100 different ledges; but the silver-bearing veins, at Silver Peak proper—a number of which are of great size and superior character—are permitted to lie idle for the present.

YANKEE BLADE.—27th: We were informed last night that the miners were generally doing well, and that several small companies were taking out ore of a very high grade.

EUREKA.—29th: Several mines are producing fine smelting ore in large quantities. The Buckeye is among the best, and, as we were informed, its owners sold 200 tons of ore at the dump for $6,000—at the rate of $30 per ton. The ore was bought for the smelting furnace at the camp.

Same of 30th has the following: Col. Buel says that, in his opinion, Eureka is destined to become within a short period one of the first, if not the first, silver-producing district in Eastern Nevada. The ores of the district occur in limestone, and abound in galena, and they may be readily beneficiated by smelting. For this purpose everything needed is within reach. There is now one furnace in successful operation.

WASHOE.

SIERRA NEVADA.—Gold Hill *News*, Oct. 30th: The timbering of the drift in the rich vein of white ore recently developed, is completed. The main winze is continued, and drifting from it will be commenced next week. The second clean up for the present month is being made today.

BELCHER.—The old tunnel is cleaned out and put in working order. It cuts the ledge 152 feet below the surface, and a large amount of good ore is developed by it, samples assaying over $80 per ton on the average.

LADY BRYAN.—The mill is running steadily, reducing 25 tons per day. A winze 15 feet below the south drift, in the rich body of ore developed at the south end, shows the same kind of ore, continuing downward.

IMPERIAL-EMPIRE.—The shaft is about cleaned out, and sinking will be resumed next week. The upper levels of the old Imperial give the usual yield. No ore is produced from the Empire.

GOULD & CURRY.—Present yield over 60 tons per day, assaying $38 per ton. The yield is principally from the old north mine. The El Dorado tunnel has been opened over 800 feet.

HALE & NORCROSS.—The drift westward at the sixth level, near the bottom of the shaft, has penetrated 40 feet, and has cut a rich streak of ore a foot wide. This same rich streak was found in the level above.

CROWN POINT.—The main east drift at the 1,100-foot level is in 400 feet from the shaft, the face showing only porphyry. A winze between the 900 and 1,100-foot levels develops quartz, with an occasional little spot of ore.

ALPHA.—The drift north from the 1,100-foot level of the Imperial has penetrated 75 feet, and will open the Alpha nearly 100 feet deeper than the former deepest workings.

OCCIDENTAL.—The face of the lower tunnel shows improvement as progress is made. The old mine still keeps up its regular yield.

CONFIDENCE.—Preparations are being made to operate once more.

OPHIR.—Owing to trouble from water, and other difficulties, little or no progress was made during the past week in the main west drift. The water is all out now.

CHOLLAR-POTOSI.—Present yield 125 tons per day. Average assays $38 per ton. The Blue Wing section is not looking so well as formerly. The new hoisting works will start up in about a week.

DANEY.—The old shaft—240 feet deep—is being sunk 200 feet deeper.

OVERMAN.—The general producing aspect of the mine is exceedingly good.

YELLOW JACKET.—Present yield 165 tons of ore per day, principally from the north mine.

KENTUCK.—The good yield continues, principally from the 800-foot level, extracted through the Crown Point shaft. Four mills are running on Kentuck ore.

VIRGINIA-CONSOLIDATED. — New shaft over 400 feet deep and good progress made.

WHITE PINE.

WEEKLY MINING REVIEW.—*Empire*, October 31st: A few important strikes in outside mines are reported, and the developments daily being made in the productive mines continue to be of the most flattering character. At no period since the discovery of the district have miners and all classes manifested a better feeling or more faith in the permanence of the mines and the bright future which assuredly awaits White Pine than now. The depth of our mines is no longer questionable. Good ore has been found in paying quantities to as great a depth as 300 feet. Most of the mills have large lots of ore on hand, and the winter supply is being laid in as rapidly as all of the available teams can draw it. There is no probability that any mill in the district will be idle a single day during the winter, for the want of ore. Some few claims, showing well in good milling ore, have suspended operations of late, owing to the utter impossibility to get their ores worked. A great deal of work, however, is still being done on partially developed mines.

MILLS AND FURNACES.—The base metal interest continues to command a large share of public attention, and several additional furnaces will fire up the present week. The White Pine Smelting Works (Mosheimer's) are yielding about 35 tons of ore per week. At Tucker & O'Hara's furnace six tons of metal, estimated to be worth $165 per ton, awaits shipment to San Francisco.

The 40 new stamps which went into operation the first of the week, have made no returns yet. Both the mills, however, (Tregloan's and Stanford's), are doing good service. The Dayton mill goes into operation to-day, and the Robinson will steam up on Wednesday.

The Shields Smelting Works, two and a half miles west from Hamilton, was fired up Tuesday. They are now reducing ores from three different mines, producing bullion that assays from $140 to $500 per ton of metal. They can produce 1,000 pounds of bullion per day. Sanford Hall's furnace, at Shermantown, will be ready to fire up in a few days. Phillipe' new furnace, between Swansea and Shermantown, is also about completed. Both are blast furnaces.

BULLION.—*Empire*: Our bullion shipments for the week aggregate $53,687.20, against $48,790.14 last week, an increase of $4,897.06. At the Big Smoky mill there is estimated to be $10,000 in pulp, while several other mills will clean up to-day. ....*News*: Our bullion now goes to the Bank of California, San Francisco; National Bank of Commerce, Chicago; and to J. & W. Seligman & Co., New York. Shipment for the week, $40,573.72.

SPIRITUAL MINING.—*Empire*, 30th: The Munro Mutual Mining and Tunneling Co. is a New York institution whose members are all Spiritualists. Several acres of the flat near Eberhardt City comprises the mining property of the concern. The operation of the company are directed by Madam Munro, a clairvoyant, who professes to tell exactly where the pay grit is to be found. Capital stock of the institution, $10,000,000, of which amount $3,333,333.-33⅓ has been set apart as a working fund. J. L. Bigler is the Supt. of the company. He has a shaft down 60 or 70 feet, and yesterday it was reported that he had struck a fine body of good ore. Madam Munro is consulted daily while in a clairvoyant state, and her instructions immediately telegraphed to Supt. Bigler. Of late, most of the dispatches have read: "All right; go on." Among the faithful the stock has recently gone up to $32.50; so says Bigler.

OUTSIDE DISTRICTS.—"Paul," thus writes the *Empire* of Ely District: The Meadow Valley Company own the Pioche claim, on which they have a shaft down forty-five feet, showing a well defined wall on either side of a twelve-foot ledge. This is the best looking ledge I have seen in Eastern Nevada. The ore is of a redish cast, and contains a considerable quantity of lead, $40 in gold, and an average of over $300 in silver per ton. The company are erecting smelting works, consisting of two reverberatory furnaces, and one chloridizing and one cupelling furnace. In Peermout District there is only one ledge formed. The owners have had an offer of $30,000, which they refused.

Oregon.

SANTIAM.—*Oregonian*, 30th: The following from the *Statesman* records the "positively last" appearance of Santiam upon the public boards: "J. H. Moore and G. A. Eades, returned Tuesday from the desolate regions on the headwaters of the Santiam, once the scene of so many hopes. A host of expectations were created by Santiam discoveries; tens of thousands of dollars were expended in constructing a road, opening mines, building dwellings, and in erecting a sawmill and quartz mill. The work was well done, and proved expensive, because great results were hoped for, and no pains were spared to provide the needed means and appliances. Santiam stock is now no better than waste paper, the buildings are literally the habitations only of bats and owls, and the dreary tunnels are hideous hores."

Utah.

GOOD ORE.—Elko *Independent*, Oct. 27th: On Monday, Eder & Co. received 6,000 pounds of ore to ship to L. L. Robinson, San Francisco, that is supposed to be worth $18,000. The ore is from Pioche, a mining camp in Meadow Lake Valley. Pioche & Co. own several mines in that district.

GRAVES' CALIFORNIA WIRE WORKS.—We had intended to notice fully the important exhibition of our next door neighbors, on Clay street, H. T. Graves & Co., whose representation at the Institute Fairs is always a notable one. Everybody has seen their fine samples and wares in the Pavilion, but they can only get a full idea of the extent and importance of the home trade and manufactures of this house by calling at the works, No. 412 Clay street.

MINING AND SCIENTIFIC PRESS.

The Inventor's Medal.

In the awarding of the Inventor's Medal the Special Committee of the Mechanics' Institute is pretty generally deemed to have made a mistake. Waterhouse's "Rotary Mechanical Power" has been prononnced (virtually) by this committee to be not merely an invention entirely original, but one promising to be of "great benefit and valne to the people of California." The patent grauted to Mr. Waterhouse was not for an entirely uew mechanical power, bnt for three different combiuations of old devices, which seem to be as old as the steam engine, having been substantially invented by James Watt, in what is known as the "sun and planet movement," described in Bourne on the Steam Engine, London edition of 1862, p. 21. That the Waterhouse invention is not likely to prove of great practical benefit to the peoplo of California may be inferred from the fact, attested to us hy a competent mechanio conversant with the measuring power, that ahont 60 per cent. of tbe power applied is lost by friction. In the model exhibited, a weight of 300 pounds was easily raised, it is true; hut it was by a leverage of a crank having a sweep of several feet, to a winding cylinder of several inches, with no less power certainly than wonld be reqnired by a common miner's windlass of like leverage; and such was the friction tbat the weight, when left snspended, wonld scarcely move the crank backwards or fall to the ground at all. Perhaps with the consent of Mr. Waterhonse the matter may yet be recommitted and critical parties in geueral be satisfied as to what may be due to the credit of the Mechanics' Institute.

A Great and Good Man Fallen.—The telegraph of last evening announced the death of George Peabody, Esq. He died at London, at half-past eleven o'clock Thursday morning. In the death of Mr. Peabody a man has falleu, who, without titles or official honors, has acquired a world-wide reputation, and whose loss is sincerely monrned, as a public benefactor, by the two most important nations of earth.

List of Awards.—The list of awards for meritorions exhibitions at the late Fair is still in the hands of the Board of Managers, for revision and oorrection, as elsewhere stated. We shall probably be able to publish it, in full, as corrected, in onr next issue.

The State Capitol of California—Finished for Occupancy.

The completion to this stage of the splendid structnre at Sacrameuto is worthy of record as a note of civilization's progress on the Pacific coast. On the 6th of December, the Legislature will occupy its chambers in the bnilding, and the several State officers, the Supreme Court and the State Library will be found for the first time in our history, in permanent quarters. The complete finishing, gradiug, etc., will reqnire another biennial interval.

The State Capitol of California is a magnificent building, worthy, in uobleness of design, dimensions, and solidity of construction, to represeut the future of this State. The origiual architect was Mr. Clark, deceased; the presont architect is Gordon Cummings. The lower story is of Folsom granite, the npper ones are of brick. The bnilding measnres over 300 feet front, includiug porticos, with center and end wings, and 76 feet from ground liue to top of balustrade. The dome is 72 feet in diameter at its base, and with two stories of portico or tambour, rises 216 feet from the gronnd line. There aro 20 columns 38 feet nine inches high on the sides, rear and front; the latter snpporting a tympanum, on which are sculptured the fignres of Mining, Commerce aud Agriculture. There are also 76 pilasters, which form the division hetween the three stories of boldly-arched windows, of which latter there are 172 in the bnilding. The lower story, which forms the basement to the superstructure, has a sub-cornice and a full Corinthiau cornice, which crowns the entire building—a girth of over 1,300 feet. The basement, or first story, contains the Snpreme Court Room, and its adjuncts; besides offices for the Governor, Secretary of State, Controller, State Treasurer, Attorney-General, Snrveyor-General, Public Instruction, etc., etc.,—28 rooms in all, with all the minor appointments, and, like the other two stories, this is intersected by the center rotunda, and three largo halls, 16 feet wide. The second, or principal floor, which is reached hy three amplo stairways from the interior, and a noble structure of granite steps in front of the main portico, contains the Senate and Assembly Chambers, and State Library, each forty-six feet in height, with galleries, and finishing with domes, besides fourteen large rooms for the State officers. The third story has three large rooms for State Museum, and seventeen Committee rooms.

Much declamation, of a very nauseating character, has been perpetrated dnring ten years past, on the capital removal qnestion, and the impolicy of erecting any snch structnre for the transaction of the business of the State, at Sacramento. The result is dne almost entirely to the public spirit and pertinacity of the citizens of Sacramento, who "made the fight" on the capital question at every uew issue and turn in its thousand recurring phases, with a quiet promptness, a coolness and a determination worthy of the admiration of all other public spirited communities.

Sacramento is safely leveed—not a fool will raise his voice on that question hereafter—and to-day she is crowned with the dome that proclaims her own glory, as well as that of the State which henceforth will be proud to recoguize her as worthy to be the capital, since she is a monument of Californian pluck. The live citizens of Sacramento, led on by the *Union*, in like manner undertook to and did put through the Pacific Railroad against influences as adverse and as disheartening as the floods. The people of the State Capital have thus, in a very unostentatious manner, won to themselves a name that partakes of the glory of Venice, and of Chicago. Nobody within her levees can rise up and say, "I did it," for it is the result of a certain tone that characterizes the community, the principal feature of which is that same republicanism of Rome and Venice while no selfish "ring" or strong-willed individual loom up as dictator or as the enemy and destroyer of the people's spirit of unity.

Sacramento modestly points down the river for the future great terminal city of the Pacific Railroad—to Vallejo, and to Oakland, and San Francisco. But the competing lines of transportation from Sacramento now bring that city to the very borders of the ocean; at the same time she is the natural, as well as the *de facto* terminus of the road, herself. Situated in an agricultural region of boundless productiveness; the distributing point of the mines of the interior for about all that does not belong to the dominion of the future Southern Pacific Railroad; a place noted amongst our restaurateurs as "furnishing the cheapest living in the world," therefore favorably adapted to economical manufacturing and to furnishing homes of prosperity for laboring men: we see no limit to the growth of Sacramento. May she give the impress of her character to the destinies of the State.

The "Silver" Palace Cars.

Much has been said about the "Pullman" Palace car, but there is another competitor in the field for the favor of the traveling public, whose claims, though advertised merely hy verbal report, are equal, it would seem, to the Pullman, since the Central Pacific Railroad Company have stocked their road with them in preference to the Pullman car. One of these traveling palaces recently arrived at Oakland, in charge of the builder, Mr. J. H. Jackson (of the firm of Jackson & Sharp, Wilmington, Del.), who is accompanied by a party of 44 ladies and gentlemen, known as the Delaware party. The Silver Palace is the Woodruff patent, and is more simple in construction than the Pullman; having in the day time the seats throughout on either side, as in an ordinary passenger car, two always facing each other and constituting the lower berth in the night time; the mattrasses and upper berth being placed overhead, when not in use, and so effectually out of the way as not to leave anything distinguishable from the arrangements of an ordinary car. At each end of the car are two toilet rooms. The finishing is of crimson plush velvet, and silver plating.

The Wilmington car factory of Messrs. Jackson & Sharp is the second largest shop of the kind in the United States. It has supplied not only the Central Pacific, but the California Pacific road, with a large proportion of their best passenger cars.

Botanical.—Dr. A. Kellogg, the well known botanist, has just returned from a botanical tour through Oregon and other northern parts, bringing with him large and valuable collections of seeds, plants, and notes that will undoubtedly enrich the proceedings of the California Academy of Sciences during the coming winter.

Mr. Wm. M. Canby, botanist, and Isaiah Hoops, florist, who are at present on a visit to this State with the "Delaware party," have been very industrious in collecting seeds, and will take with them many novelties peculiar to Yosemite valley and other regions visited.

Vanderbilt Bronze.—We acknowledge the receipt of an invitation to be present at the unveiling of the Vanderbilt bronze, on Wednesday, November 10th, at the Hudson River Railroad depot, St. John's Park, N. Y. Attached to the cards of invitation are coupon checks to the platform and refreshment rooms. Thanks to the gentlemanly managers of the ceremonies; but we have "refreshed" quite too muchly at Commodore V.'s expense, on the voyage to this State in "ye oldon time," and have no hankering after any more of his refreshments.

Mining a Failure.

Mining may he declared a failure by many whose success is nevertheless based npon that interest; hnt we conceive it to be far more sensible to say that stock jobbing, incomplete working and reckless management are a failnre.

As Prof. Rowlandson once observed, when speaking of the Ophir, it is sometimes that a mine is found to pay under the stock jobbing system, bnt so seldom, that it may bo considered as merely a dangerous experiment.

The troubles in our mining enterprises (failnres?) may be set down as emanating from three causes: 1. Reckless waste of metal. 2. Reckless expenditures. 3. Too much stock jobbing.

Every miner must admit that there is enough metal in the ore. The thing is to get it out. Also that, exceptingin isolated cases, there has heen an unnecessary extravagance; and where it comes to stock jobbing, that has too much taken attention from legitimate mining.

Take our Nevada mining companies, where a systematic effort has been made to count np big figures as shipments, instead of dividends. This system of mining is absurd. We have not mined for profit; we have mined for metal, and run half off at that. Speculative mining is a failure. Let all accept it as such, and go to work on a real basis, that will soon establish a more prosperous condition of affairs. To do this we must adopt three principles: 1. More perfect working of ores. 2. Strict business economy. 3. We must abandon speculation.

The idea that we cannot make our great mineral domain a profit to us as a people, when the average per ton of all the ore in California and Nevada exceeds that of most mineral districts elsewhere, where they do make them profitable, is not worthy of consideration. We have only to do as we know well enough how to do, and to apply the common business principles to this branch that we do to others, and the results will he as profitable and certain as those of any other pursuit.

The Grand Carnival.—Great preparations are being made for the grand closing Carnival Ball, to be given under the management of the Directors of the Mechanics' Institute, at the Pavilion on Tuesday evening next. To induce those participating to properly sustain the characters they assume, four valnable prizes will he awarded to the first and second best caricature sustained, each, by ladies and gentlemen. The first prizes will he of $100 actual cost; the second $50. The space under the nave will be partitioned off from the side wings, and comfortable seats will be provided for spectators in the wings and galleries at graduated prices, from $1 to $2, as per advertisement. Carnival tickets for gentlemen and ladies, $5.

Not a Local Institution.—The best reply that could possibly be given to the objection mooted in our last issue against making the Mechanics' Institute of San Francisco a local California institution, instead of one calculated to foster industries, national and international, on the Pacific Coast, is to ho found in the list of premiums that are now actually awarded, from which it appears that all of the Pacific States are fairly appreciated according to their merits.

Spring Valley District Ore.—Mr. G. Henckel has brought a batch of ore from Spring Valley District to this city to he worked by Mr. Strong, representing the Red, White and Blue, the Telegraph, and the Mayott mines—situated forty-five miles west of Hamilton, and eighty east of Austin, and south of the Austin and Hamilton road. It assays from $300 to $1,700, and is a black-colored sulphuret, having copper stains.

Our Cities' Charities.

True religion is made up largely of kindness—kindness to one another, kindness to the unfortunate. The spirit of charity which prevails in San Francisco, has become proverbial the world over. Our people take a just pride in the reputation they have gained in this particular. Evidences of the spirit of benevolence, of generosity in giving, are visible all about us. Our public institutions, devoted to this object, are numerous and well supported. They have all been costly from the start; but our people have cheerfully borne the burthen—the public purse has never been closed. The benevolence of Californians needs only to be properly approached, to exhibit itself in deeds worthy of the highest praise.

Our hospitals are numerous, roomy and well arranged, providing liberally and beautifully for the sick of all nations. Our orphan asylums are temples of mercy, in which strange, though loving hearts, supply the places of parents to the little waifs of humanity, which fortune has cast upon the charity of the world. The poor inebriate, broken down in health and fortune, and too often left to swift destruction, is here sought out, and every effort made to reform him and make him once again a man. The unfortunate youths, who have wandered into ways of error, by reason of parental neglect or from other causes, are here provided with homes, schools and means of reformation. The laboring man or woman who comes among us, a stranger and alone, is not suffered to fall among thieves and robbers, as is too often the case; but kind hands and warm hearts receive them, advise them and secure for them ways and means by which they may earn an honest livelihood. Young men who gather here from all parts of the world—young men with means and of social standing at home, but who come here strangers, and with inclination to cast off the goodly restraints which parental watchfulness and kindness have thrown around them in their Eastern homes, find here Christain hearts and willing hands to lead them still in the paths of virtue. Fallen women, who are too often given over by society with scarce an effort to reclaim them, here find a way and refuge, and angelic spirits go out into the by-ways and highways and compel them, with Christain kindness, to come in and be saved.

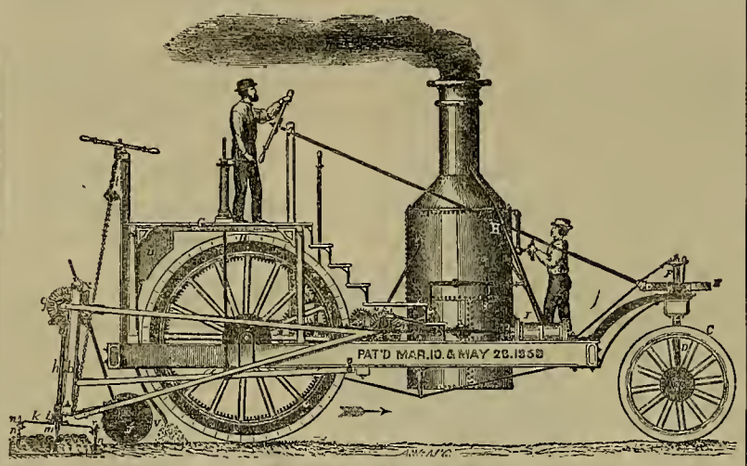
Many other public charities might be named which flourish and do untold works of charity and kindness among us. In fact, there is a great invisible brotherhood in this distant land, moved by that spirit which links man to his Creator, which unites all men and all nations into one great family of humanity, and which, without name or organization, is known only by the aggregate of its deeds silently and quietly performed, but which sends living streams of sunlight into the hearts of thousands of sufferers, of all conditions in life. May these streams ever continue to flow! Such acts angels witness and Heaven approves. They are the noblest efforts of humanity to make mankind happier and better, and render its sorrows and sufferings lighter and less.

Winterhoff's Circular.—The New York metal circular of R. C. Winterhoff, from which we usually give monthly extracts, has been discontinued. Mr. W., in his announcement of the fact, says that the Atlantic Cable, and the ever fluctuating currency, have of late years so affected the metal trade, that it does not now offer the advantages which it formerly did. The same causes render the monthly publication of a circular of very little account. The late increased facilities for communication and transportation have had a wonderful effect in disarranging old systems of business and introducing new; the people, on the whole, are benefitted by cheaper prices.

The Standish Steam Plow.

We here republish a side view of the Standish Steam Plow, already well known to most of our readers; but an invention which we desire to keep before the people, as one which promises to work a revolution in the important industrial department for which it has been devised. As will readily be perceived, it is a locomotive steam plow, the operation of which is quite novel and effective.

The manner of locomotion and general construction of this plow will be readily perceived by an inspection of the engraving, as well as the mode of steering or guiding the same. The man shown on the upper platform is engaged in that act. The earth is plowed transversely to the travel of the machine, and is cut up by a series of three or four cutters, one of which is shown in the engraving. Each of these series consists of four knives very similar in size and shape to the coulter, sometimes employed to cut the ground in front of an ordinary plow. The knives are made to revolve very rapidly, which action, together with the advancing motion of the machine, cuts up and pulverizes the earth more thoroughly than it can be done by the use of both the common plow and harrow combined. The depth at which the knives work is regulated by the hand wheel or elevating rod shown in the rear. There is a seed sower shown in the engraving, which may be used or not, as desired.



THE STANDISH STEAM PLOW.

that season. The crops raised on this ranch last year were below the average; but we are credibly informed that the yield on the ground prepared by this plow was better than that on similar and parallel ground prepared by the common plow. The experience gained by the use of this first plow, the "Mayflower," has enabled the inventor to devise important improvements, which will be introduced into the next one built.

The Mayflower has recently been repaired and put in as good working as practicable for so imperfect a machine, and is at work in Petaluma, turning over tough adobe soil, the full results of which we shall learn in a few days. Thus far, we understand the present trial has been eminently successful.

Over 100 acres of land were plowed with the machine here shown, last season, on the ranch of Mr. Kelihor, near Pacheco, in Contra Costa County, plowing three acres in a single hour, and demonstrating its economy over horse-power by the amount of fuel consumed, and time employed, careful records of which were kept.

The boiler, an old one, then employed, was found to be so unfitted for its work as to call for such extensive repairs and alterations as to render it impossible for the inventor to prosecute the work any further.

This plow drew the gold medal at the last Fair of the Mechanics' Institute for the best California invention exhibited at that time. It has been patented in this country, and in France, England and Russia. The foreign patents are for sale; also the right to manufacture in portions of the United States.

Test Trial of Safes—The Sanborn Steam Safe.

The Kittredge, Tilton & McFarland, and a new patent called the Sanborn Steam Safe, just brought to this coast by H. S. Lamber, were tried in a ten hours' fire on Thursday, on the site of the old American Theatre, Sansome street; all being of the same internal capacity, but externally successively larger in the order named, owing to the varying manner of construction. The peculiarity of the Sanborn safe consists in having copper vessels filled with water placed as a lining between the inner wall and the book-case. Fusible solder seals these vessels, and, when subjected to a fire, the soldor melts prior to the boiling of the water, then converts the water into steam which, filling the intervening chamber, serves as a protector against any degree of external heat, for any probable duration of fire. "Return tubes" prevent the water from running out in case the safe should roll in the fire.

At 5:30 A. M. the fires were lit; at 11.30 A. M. the Kittredge safe smoked, and was taken out of the fire; after 12, smoke also emerged from the Tilton & McFarland; and at 2 o'clock P. M. the fires were extinguished around the two last named, the test being pronounced by all present to be very severe. The safes were all warped, and the papers were quite burned to cinders in all but the Sanborn, which showed some slightly discolored, but otherwise uninjured. The Kittredge and Tilton representatives state that Mr. Lamber, the experimentalist, purchased inferior articles of their manufacture, which they surmise may have been tampered with; but a committee is to report on the matter. A friend present at the trial has left us a sample of cards and a piece of wood work contained in the Sanborn Safe, which are perfectly preserved.

Mineralogy of Yosemite Valley.—Garnets, sphene, molybdinite, hornblende, and other interesting materials, are reported by Mr. J. H. Caswell, to be plentiful in the granite of Yosemite Valley.

The University.—The California University Regents have been allowed $100,000 of the proceeds coming to that institution from the tide land sales.

The mill of the Nevada Land and Mining Company, Reno, started up on November 3d with the Stetefeldt roasting furnace, on Alpha, Humboldt, ore.

The Chico Fair.—We have some delayed notes concerning this exhibition, which will receive attention next week.

Closing of the Mechanics' Fair.

The Seventh Industrial Exhibition of the Mechanics' Institute closed on Saturday evening last, on which occasion the Managers announced the award of premiums. For "forty days and forty nights," plus one, the Mechanics' Fair Pavilion has been the center of attraction for old and young. The managers and members of the Institute may well be proud of the results which their energy and enterprise have achieved. The mechanics and manufacturers of San Francisco, as a whole, are men of superior intelligence and energy. They are drawn from, and unite the experience and advantages of, all climes and of all nations. In no other single city in the Union could there be organized and brought to such successful issue, so complete an exhibition of the products of the world's industry as is here displayed.

A most brilliant financial success has crowned this Exhibition. The total receipts and expenditures will be found in another column, as also the amounts realized for benevolent purposes. A handsome sum has been realized to be devoted to the reduction of the debt on the Institute building, on Post street, and for additions to the library, etc. The expenditures do not include the gratuitous labors of the managers of the Exhibition, which have been exceedingly onerous and self-sacrificing. It is also gratifying to know that the new, admirable and comprehensive plan adopted to aid the benevolent enterprises of the city, has proved a most signal success—realizing a much larger sum than has ever before been obtained by similar efforts of the Institute.

The result of this Exhibition will be a new and favorable impulse to the Institute, one which will inspire it with a disposition to put forth fresh energies to accomplish ends still more worthy of the mechanics of San Francisco, and more deserving of the commendation and encouragement of the public.

It has long been the wish of the managers and leading spirits of the Institute to furnish apprentices and younger members engaged in the industrial arts, more full opportunities for study, and the attainment of a comprehensive knowledge of the particular departments of industry in which they are engaged. To accomplish this, free evening classes, presided over by a competent teacher, are needed; together with frequent popular lectures on the mechanic arts, and the various sciences, to which the general public may also be admitted on the payment of a nominal fee for the series. We believe it is the intention of the management of the Institute to propose to the body of members that a suitable sum from the fund now in hand should be set apart for initiatory purposes in this direction. Probably one of the first things needed will be a set of philosophical and chemical apparatus, to be employed in the illustration of popular lectures, whereby the public, outside of the Institute, may receive a direct benefit for the patronage which they have so liberally extended towards this deserving institution.

The Japanese Colony, near Placerville, notwithstanding the unfavorable reports circulated a few weeks ago, is nevertheless in a prosperous condition; so says the Placerville *Democrat*. Quite an additional number of colonists have recently arrived, and hundreds more are expected soon. Plowing and sowing for the next year's crop have already commenced.

The Oakland Cotton Mill is now at work manufacturing Burlaps of first quality. Excellent samples of such manufactures were on exhibition at the Mechanics' Fair. This company is purchasing flax fibre for their mills, and we see it stated that they are offering as high as $90 per ton for clean broken flax.

Railway Accidents—New York Society of Practical Engineering.

The regular monthly meeting of the Society was held on Wednesday evening, October 13th, at Cooper Institute, New York City. The President, James A. Whitney, occupied the chair. The regular subject for discussion was "Railway Accidents and the Means of Prevcuting Them;" and a paper on this theme, written by C. Williams, a civil and mechanical engineer of New York City, was read before the Society.

Estimates of the Value of Human Life.

The author of the paper, in the introduction, adverted to the difference in the estimate placed upon the value of human life by railroad directors in this country and Europe. The fact that twice as much money is expended for safety in the latter country as here, seems to indicate that human life in the old country is twice as valuable as in the new. The cause of this apparent carelessness in the United States is probably the anxiety of railroad officials to get the road in running order as quickly as possible, so that money may begin to come in to their treasuries.

Kinds of Accidents.

He also demonstrated the great importance of the subject in consideration of the various kinds of accidents to which a road is exposed, such as those resulting from defective bridges and trestle work, the effect of rains undermining the track, the sliding of cuts and embankments, boulders, animals and other obstructions appearing on the track, switches displaced, trains being out of time, broken rails, etc., etc. Adding those causes of accidents which relate to the train, the list becomes appalling, and calls for the earnest investigation of the subject by every inventor and railroad director. One of the most serious hindrances, however, in the way of improvement in railways is the difficulty of enlisting capital.

Improvements Suggested.

In considering those improvements which relate to the road, the writer remarked that, although the introduction of improvements may add to the cost of the road, yet the ultimate economy which will result from the durability thus obtained will often in a great measure compensate for the first expense sustained in the carrying out of the improvement. First in importance in the discussion of the road itself, and those improvements necessary to give it a permanent and reliable character, is the ballasting and substructure of the track. The writer regarded that construction for a road in which gravel or broken stone ballasting was employed as the most desirable. Where this is not done, however, some longitudinal subsill for the ties to rest upon must be used. The objection to the use of rail timbers for subsills, lies in the difficulty of replacing them when decaying; plank subsills are to be preferred. A new idea of ballasting or subsilling has been proposed for roadbeds of soft materials. It consists in adapting the principle of sand piles for the support of foundations. Among the various methods of carrying out this principle to give more stability to the superstructure of roads, is the following: Trenches, longitudinally with the road bed, are dug under the rail or subsill with sloping sides, and nearly filled with sand. The plank subsills are placed upon the sand, and ties fixed to the planks. The sand being incompressible, the advantage of the horizontal resistance of the earth is thus obtained, and the road rendered stable. With reference to the various substitutes proposed for cross-ties, the writer asserted it as his opinion that none so far excelled them in economy and durability, especially where the ties have been prepared by some of the various wood-preserving processes. The fastening of the rail to the ties is, however, a subject on which more may be said; for the safety of a passing train depends in a great measure on the manner in which the rails have been secured to the foundation. This involves the discussion of chairs and spikes. There have been a number of improvements in railway spikes, the object being to prevent their drawing easily. The twist spike, so constructed as to turn in driving, and having notched or serrated sides, is extremely tenacious in its bold upon the wood. Another excellent device is the prong spike, which is split about one-half its length, and the two halves being bevelled at the points, branch off in opposite directions, and is very difficult to draw. The old chair is rapidly going out of use. Its principal defect is that it cannot be tightened. The fish joint has strength and can be tightened, but the process of tightening in this case is very inconvenient. A joint which may be easily tightened and kept so, is a great desideratum for the separating of rails at joints, and is a very serious cause of accident. An invention has been made by a Mr. W. Griswold, by which the tightening is accomplished automatically by the concussion of passing trains. The plates are thus kept in position, thereby insuring a tight joint with the two ends of the rail on the same level.

The Straying of Animals, Etc.,

Upon the track, is an important consideration, and the use of some good track guard is a desideratum. The old track guards do not seem to fulfil their object, as cattle sometimes break through and appear upon the track. The writer proposed that a system of beams presenting a sharp upper edge, should be laid diagonally from one rail to the other on either track. It thus becomes inconvenient for men or animals to remain long upon the track. With regard to those accidents occurring from vehicles attempting to cross the track while the train is approaching, he observed that whatever device is employed for closing a gate or displaying a signal, it should be operated by the approaching train. This may be accomplished in one plan by connecting a lever a certain distance along the track with the gate or signal, by means of a wire rope passing over friction rollers. In other cases, a metallic tube is substituted for the rope, and a tight-fitting piston is operated by the lever. Switches should be provided with an electrical apparatus, whereby notice may be given when a switch is placed wrong, this being almost the only means of preventing the many accidents occurring from this cause. The writer considered the comparative value of steel and iron rails as yet an unsettled question, and remarked that the fact of several companies adopting the former does not prove much to the point, for economy, on account of greater durability, may be the object instead of safety. A compound rail might be constructed, combining the advantages of steel and iron.

Merits of Steel and Iron Rails.

The meeting was also addressed by Abram S. Hewitt, who spoke at some length on the relative merits of steel and iron rails. He considered that steel must replace iron on roads transacting a large amount of traffic and running heavy engines at high speed. In other cases, iron would answer. As to the question of the comparative merits of steel and steel-capped rails, he remarked that where a good weld could be obtained between the iron and steel, there was no difference whatever, according to our present experience as to durability, the difference being a matter of economy. He described the manufacture of steel rails direct from the ore, and also spoke of a plan lately put to a successful test, of constructing rails by simply bending the steel over the iron, no weld, whatever, being obtained. It is found that, contrary to the expectation of most engineers, that continued use only served to force and confine the cap in place with increased rigidity and tightness.

The meeting afterwards adjourned until November 10th, when the subject will again be renewed and especial attention directed to subjects of safety brakes, safety wheels and axles, safety platforms, metallic cars, railway telegraphs, etc.

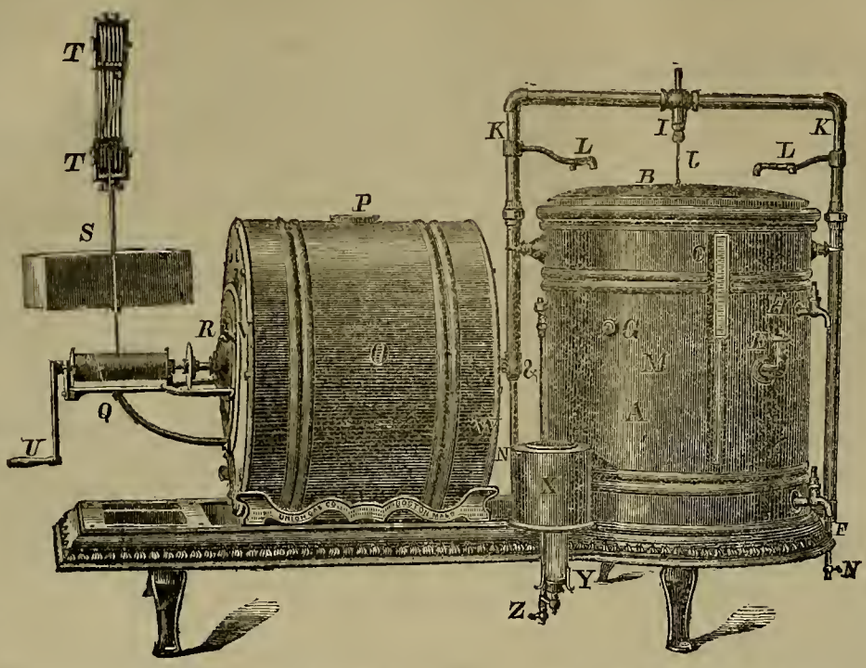
BOSTON UNION GAS MACHINE.

One of the Latest and Simplest of Self-Acting Gas Machines, yet invented,

Is illustrated in the accompanying cut, and which is

In Operation in the Fair,

and others which are successfully working in this city for the past year.



The FLUID from which this gas is made is "Gasoleine,"—a cheap, abundant product of petroleum. It is really light naphtha, and this appellation of "gasoleine" is employed to denote that the naphtha is within certain specific gravities which make it volatile enough to generate gas from.

The gas is nothing but the vapor of this gasoleine mixed with common air in the proper proportions.

A is the generator; B is the cover or holder, with a rim of water to prevent escape of gas; O is an air pump, to force water into the liquid; S is the weight to propel the air pump. The weight, S, begins to fall, and by means of the wire-rope, pulleys and drum, revolves the pump inside of O, which then forces the air through its center up one pipe, K, through the valve I, down the other pipe, K, under the generator, and up through the fluid by means of a float. It is then gas. The floating cover, B, holds it, and as more gas is made, it rises up, until the pressure of the gas under this holder or cover balances the power that forces in the air, whereupon the weight ceases to fall and the pump to move. As soon as a burner is lighted, gas is consumed, and the pressure diminishes in the holder, B. Of course the weight is then greater than the pressure and therefore begins to fall, which in turn induces the air-pump to move and fill up the vacuum, or rather to restore the equilibrium. The more gas that is used the faster the pump moves and the more the weight falls.

ADVANTAGES OF GAS MACHINES.—You obtain all the benefit of coal gas by three minutes' attention a day. In almost every place the same amount of light will not cost more than half as much as coal gas light, besides being much more brilliant.

When parties wish the entire work of PIPING, FURNISHING MACHINES, etc., executed,

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in case of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Metallurgy.

MOSHEIMER'S

Pioneer Mining School

— AND —

METALLURGIC WORKS.

ESTABLISHED.....1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to work any kind of ore, or mineral substances.

Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.

I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.

For terms, apply to **JOS. MOSHEIMER,**
Practical Chemist and Metallurgist.

Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

G. W. STRONG,

ASSAYER AND WORKER OF ORES,

No. 10 Stevenson street, near First, San Francisco.

Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms. 14v15qr.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original, Non-copathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London. 8v19-6m

Office of the Company, northeast corner of Front and Jackson streets.

B. M. HARTSHORNE, President

13v12

[From the Mechanics' Fair Daily Press, Oct. 30th,]

REVIEW OF THE FAIR.

CLASS XXI.

MISCELLANEOUS ARTICLES NOT COMPRISED IN ANY OF THE FOREGOING CLASSES.

Most of the articles in this class have already been noticed in the columns of the Press. John F. Snow exhibits specimens of glove and feather cleaning and dyeing, and of fur dyeing, a most useful and economical art, in which he manifests much proficiency. Ephraim Vorbes exhibits his combination lock, a California invention, patented through the M. & S. Press Patent Agency. Combination locks are designed to be the perfection of mathematical and mechanical science, and Mr. Vorbes seems to have carried his inventive researches in this direction to about the fullest extent of human ingenuity. The mathematics of this invention are such that when the correct combinations are missed once, as may be done, accidentally, by the proper person, a second attempt is readily practicable; but when that fails, the device seems as if endowed with intelligence to know that it is being tampered with, and is immediately thrown into an almost inextricable confusion, from which it can be released only by some eight hours' steady work by the party in possession of the correct combination.

A great number of curious and interesting exhibitions are made in this department, which would be interesting to dwell upon, but the want of time and space admonishes us that we must here draw our lengthy "Review of the Fair" to a close. In its progress, we have no doubt omitted some things entirely, and perhaps dwelt too briefly upon others worthy of more extended notice. If our attention is called to anything in which we may have fallen short, we shall take pleasure in making full amends, therefor, in future issues of the Mining and Scientific Press—of which journal the Fair Press is but an adjunct.

Straw Wood.—At the American Institute Exhibition is shown straw paper, a substitute for wood,—intended to be used for inside work of dwellings, railroad cars, steamboats, or in any place where wood is used. It does not expand or contract. It can be moulded into any form by pressure, thereby saving the expense of working elaborate patterns. It is made fire and waterproof by asbestos. For ornamentation, it can be made to represent the most expensive woods, marbles, frescoes, bronzes, etc., etc., at a small expense, and can be taken down and put up in other places if desired.

Clothes Line Fastener.—One of the most valuable little novelties on exhibition is the patent clothes line holder of Smith & Freeland. By its application a clothes line can be put up or taken down as quickly as you can close a jack-knife, or wind a rope around a peg. It is self-fastening. You pull one end of the rope and it remains as tant as you strain it. The device consists of two small pieces of cast iron, forming a lever, and "short bite." A good thing. Sold for 75 cents at No. 17 Geary street.

A Permanent and Reliable Insurance Agency.—The firm of R. B. Swain & Co., whose office is on California street, below Battery, are among the oldest and most successful fire insurance agents of this coast. They represent none but first-class companies, and by attending quietly, but faithfully, to the interests of their business, they have gained an enviable reputation and a large and permanent patronage.

Home Manufactures.—The fresher we can get articles of food from the manufactory, so much purer and wholesome we generally find them. This is especially so with the chocolate, coffee, and other good things made by D. Ghirardelli & Co., at Nos. 415 and 417 Jackson street. Their business was established in 1854, and they have kept up a No. 1 reputation ever since.

The Locher Steam Plow model was withdrawn from the Fair several days since. It was our intention to have made a full and particular notice of it, but shall be obliged to defer it for some future number of the M. & S. Press, when we hope to be able to give an illustrated description of his important invention.

To Inventors

ON THE

Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of Letters Patent of the United States:

Established in 1860.

Our business has been long and successfully practiced, and we are thoroughly responsible for the confidence and valuable trusts placed in our charge. Our advice can always be relied upon as correct.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with and have full records of all former cases, and can more correctly judge of the value and patentability of inventions discovered here, than any other agents.

Steps Necessary to Procure a Patent.

The first thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, of hard wood or metal, or both, and varnished or painted; the name of the inventor and the name of the article should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention, and the relation of the new to the old parts of the machine.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operation.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by registered letter, post office order, or by draft on San Francisco, payable to our order. Always send a letter with the model, and with the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and acknowledgement before a Notary Public or Justice of the Peace, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and at the expiration of two years the invention therein described shall become public property as against the applicant therefor.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, (unless they are of a common and well known character), and also of the manufactured article itself must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case the applicant has only to send us an exact description, and what it is desirable to claim.

For Designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances two photographs, with the negatives, answer well instead of drawings.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication, usually the business can be well done by correspondence.

The usual time required to secure a patent, when the case is conducted at our agency, is from one to two months. We sometimes get them through in two weeks. In rare cases, however, owing to delay on the part of Government officials, the period is sometimes extended for months. We make a special point to advance our cases as rapidly as possible, and have been successful in obtaining patents for this coast more surely and speedily than any other agency in the United States.

Letters Patent and Who Can Obtain them.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

Citizens of Canada and Nova Scotia have to pay a fee of $500 for patents in the U. S., owing to discriminations made against Americans.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

A majority of the Patents issued during the past eight years to Pacific Coast inventors have been secured through our Agency; consequently we can more readily and correctly advise new applicants than any other agent.

Important Advantages.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights *much sooner* than by trusting the same to distant agencies, situated at New York or Washington.

Many inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use. A personal verbal explanation is oftentimes of important service, and enables us to do more successful than agents generally.

Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

By an able and faithful representative of our firm in Washington, our clients' applications are guarded against indifferent examination, unfair treatment in any contingency, and hazardous delays.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the Mining and Scientific Press.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the thousands of inventors and patentees on this coast who have patronized us.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is $25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 y'rs and 8 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20

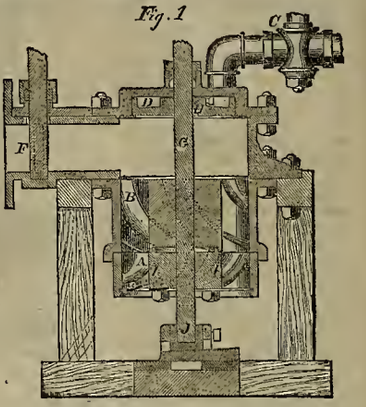
Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

A. LIND, Millwright,
Pacific Iron Works, San Francisco.

Western Union Telegraph COMPANY.

GENERAL REDUCTION OF RATES.

A general revision of the Tariffs of this Company has been completed, and the rates between all points on the Pacific Coast

LARGELY REDUCED!

THESE REDUCTIONS VARY FROM

Twenty-five to Sixty Per Cent.

And are several thousand in number. The new system adopted bases tariffs upon AIR-LINE DISTANCES, thus giving each office, as far as prices are concerned, the benefit of a DIRECT WIRE TO ALL POINTS.

☞ Particular attention is asked to the following scale of charges, applicable to EVERY TELEGRAPH OFFICE, WITHOUT EXCEPTION.

The COST OF A TEN-WORD MESSAGE to any office within

25 Miles will not exceed.....25 Cents.
50 Miles will not exceed.....35 Cents.
100 Miles will not exceed.....50 Cents.

While the charges in some instances may be LOWER, THEY WILL NEVER EXCEED the above scale.

The following are the old and new rates to some principal points:

TO	OLD RATE.	NEW RATE.
Alameda	50 cents.	25 cents.
Benicia	50 cents.	25 cents.
Haywards	75 cents.	25 cents.
Martinez	75 cents.	25 cents.
Oakland	50 cents.	25 cents.
Pacheco	75 cents.	25 cents.
San Leandro	75 cents.	25 cents.
San Rafael	50 cents.	25 cents.
Vallejo	75 cents.	25 cents.
Napa	75 cents.	35 cents.
Petaluma	75 cents.	35 cents.
Santa Rosa	$1 25	35 cents.
Stockton	35 cents.	35 cents.
Sacramento	35 cents.	35 cents.
Suisun	75 cents.	35 cents.
Sonoma	$1 00	35 cents.
Vacaville	75 cents.	35 cents.
Portland	$3 00	$2 00
Los Angeles	2 50	1 50
Hamilton	2 50	1 75
Treasure City	2 50	1 75
Victoria	4 00	2 50

GEO. H. MUMFORD,
General Agent.

Advertising and Subscription

Rates for the Mining and Scientific Press.

Subscriptions in Advance:—One year, $5; Six months, $3; Single copies 12½ cts; Monthly Series, $5 per annum; Quarterly Series (still paper binding) $6 yearly.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the Mining and Scientific Press from this date:

One column, one year	$400 00
Half column, one year	200 00
One column, six months	200 00
Half column, six months	100 00
One column, three months (13 weeks)	100 00
Half column, three months	60 00
Per line (smallest type) one year	3 00
Per line (30 lines or more) one year	2 40
Per line, three months	1 00
Per line (10 lines or more) three months	80
Per line, one month (4 weeks)	50
Per line (10 lines or more) one month	40
Per line, one week	25
Per line (10 lines or more) one week	20

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

☞ All advertisements in the Press appear in both the ☞ Monthly and Quarterly Series of the Mining and ☞ Scientific Press, which (by special arrangement) are ☞ placed for free reading in the principal hotels, steamboat and steamship saloons, depots, and public reading ☞ rooms and libraries in San Francisco, and the Pacific ☞ States. Many volumes are also bound, thus affording ☞ permanent advertising.

The Press now receives the largest and best advertising patronage of any weekly paper west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers*. Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

White Pine Items.

We gather the following from the White Pine papers:

News: The Aurora Consolidated is sending to mill seventy-five tons of ore per day, giving an average yield of $59 per ton. This company will be in condition to pay regular monthly dividends from $1 to $1.50 per share from the beginning of 1870 —or $16,000 to $24,000 per month....Addington is taking ont high grade ore from the 70-foot level....Borealis has struck good ore at 43 feet....California has started up again....Consolidated Chlorido Flat has taken out 371 tons 520 pounds of ore for the week ending yesterday, or 58 tons per day for the six working days....In Eclipse Consolidated, the second stratum of ore struck on the 112-foot level has been cut east and west 52 feet, and north and south 21 feet, and no bounds yet found to the body. Assays go $235 aud $436 per ton....El Dorado has shut down for the season....Hidden Treasuro sends to mill daily 25 tons of ore....Pogonip and Othello is running a drift from the center to the north shaft. Of 200 tons from the center, 50 tons milled $123 per ton. There is 1,000 tons on the dumps....*Empire:* Ore from Mammoth, 21 tons, paid $72 per ton. ....Eberhardt ships 20 tons of ore to Oasis mill daily. Work not yet commenced on the Defiance shaft....Paris has good ore on the 105-foot level....Rip Van Winkle, a now discovery, one-half mile west of California mine. Nels, Allen sud C. C. Downing are the owners. Thoy are taking out lead ore, and sell it for $25 at the mine. Will ship 25 tons to the smelting works at Swansea, the present week. ....Hartwell, Bullion Hill, looks splendid. A 30-foot drift at depth of 45 feet, shows $150-ore the whole distance....Truckee works seven men and ships three tons oro daily to Big Smoky mill, worth $111 per ton....The Bowie & Brown is bonded for a few days with privilege to prospect ad libitum. The price is $35,000, and the owuers are afraid the parties will take it, rich specimens having been found.

WALLA WALLA, Oct. 21th, 1869.

MESSRS, DEWEY & CO.—GENTS: Your letter of the 5th instant, with patent for crushing mill, is received, and I am much pleased and gratified for the care and expedition you have exercised in the matter.

Very truly yours, J. H. DAY.

THE PAIN KILLER is both an internal and external remedy.

THE PAIN KILLER should be used at the first manifestation of cold or cough.

THE PAIN KILLER.—Don't fail to keep it in the house ready for use.

THE PAIN KILLER is an almost certain remedy for CHOLERA, and has, without doubt, been more successful in curing this terrible disease than any other known remedy, or even the most eminent and skillful physicians. In India, Africa and China, where this dreadful disease is ever more or less prevalent, the PAIN KILLER is considered by the natives, as well as by European residents in those climates A SURE REMEDY.

THE PAIN KILLER.—Each bottle is wrapped with full directions for its use.

THE PAIN KILLER is sold by all druggists and dealers in family medicines.

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. no6

RETURNED.—Dr. J. H. Paine. Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

WANTED.—To rent a house of about six rooms, in a healthy location, near the business center f the city, for a gentleman, wife and baby. Will purchase or rent the furniture, Address X, box 17, P. O, San Francisco

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Drult, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewlz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18 3m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

19v18 6m B. F. HOWLAND.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 21v18-4w

New Mining Advertisements.

La Blanca Gold and Silver Mining Company.—Location of Works: San Antonio, District of Ures, State of Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of November, 1869, an assessment of one dollar ($1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 312 Front street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the fourth day of December, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-first day of December, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOSEPH GOLDMAN, Secretary.

I. O. O. F.

THE NEW AGE,

A WEEKLY JOURNAL OF SIXTEEN PAGES.

The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19v19

The Air we Breathe.—"Mr. Dancer has studied the character of the solid particles contained in the air of Manchester. Samples of the air were washed by Dr. Angus Smith, and the fluid was afterwards microscopically examined by Mr. Dancer. A single drop of the water was computed to contain no less than a quarter of a million of fungoid spores. The fact was verified by examining an extremely small particle, and multiplying the result. The bottle of water having been kept for thirty-six hours, the quantity of fungi, already so great, "visibly increased," and on the third day minute creatures were observed moving about in the fluid. Keeping, however, to our former figures, we find that 150 drops of water would contain more than 37,000,000 of the fungi, these 150 drops being the washings of 2,495 liters of the air of Manchester, which is about the quantity of air passing through the lungs of a man in ten hours! The drops of water yielded a kind of dust, which in the space of three or four days produced considerable numbers of animalculæ, in which monads were most conspicuous. In this dust were particles of partially burned wood, fragments of vegetation, filaments of cotton and granules of starch."—*Exchange.*

Agassiz and the Banker.—The oration of Professor Agassiz upon Humboldt, has brought out, through the Newark *Advertiser*, an anecdote. A pompous mayor of a western city said to the Professor on a certain occasion that he had himself been deeply interested in natural science, but the pressure of business had prevented its pursuit. "I became a banker, sir, and I am what I am." The style of grandeur in which the words were uttered is said to be indescribable. Agassiz immediately recited his own early history; how his father had provided a place in a bank for him on his leaving college; how he had begged first for one year more of study, then for another, and when he got a third his fate was fixed. "And, Mr. W," said Agassiz, "if it had not been for that little firmness, I should to-day have been nothing but a banker."

It has been discovered by careful experiments in Charleston that the weight of a bale of cotton varies slightly with the temperature. A fall of ten degrees in the thermometer causes a bale of cotton to gain about a pound and a half in weight.

What is the difference betweeu *Appleton's American Encyclopedia* and the Mining and Scientific Press? The former contains much information about old scientific matters, the latter is full of the most recent news on the same subject.

Waltham Watches.

Let every one who wants a Watch, read this carefully.

Especially if in some remote out-of-the-way place.

Now that the railroad is open, we propose to give the residents of California the opportunity of getting single genuine Waltham Watches at the

Lowest New York Wholesale Prices.

We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, post paid, by return mail. It explains all the different kinds tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or

REFUND THE MONEY.

As an indication of the Prices, we will quote one Watch from our list. The P. S. Bartlett, Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,

$28 in Greenbacks, or about $20 in Coin;

All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the Mining and Scientific Press, and you need not put in stamps for return postage. Address in full,

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART OUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Offs at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* wonderful uniformity *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.,

On hand and for sale. Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **329** Fremont street,

1v1 San Francisco.

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

—AND ALSO IN—

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

CROSS' COMBINED
Heater & Sediment Collector

This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever, they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

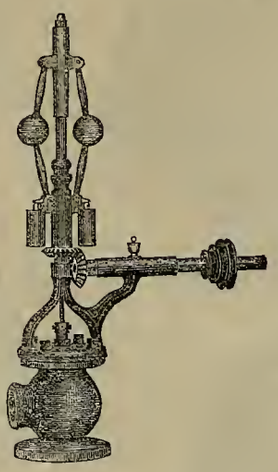
GEORGE T. PRACY'S

MACHINE WORKS,

109 and 111 Mission Street, between Main and Spear,

SAN FRANCISCO.



MANUFACTURER OF

PRACY'S IMPROVED

Patent Steam Engine Governor,

The Simplest and Most Sensitive Governor Built.

This Governor is made of the best material, the shafts being of cast steel and the bearings small, thereby avoiding the use of heavy balls and springs, running at a high velocity and maintaining a uniform speed. All sizes of these Governors are kept constantly on hand, and can be seen in operation at my works.

I also take pleasure in informing the public that during my recent visit to the East I became SOLE AGENT for

L. W. POND'S CELEBRATED TOOLS

ACKNOWLEDGED TO BE

THE BEST NOW MADE.

I shall keep constantly on hand all descriptions of

Lathes, Planers, Drills, Boring Mills, Milling Machines,

And every description of MACHINISTS' TOOLS, which I shall offer to the public at manufacturers' rates. Also

Morse's Twist Drills and Chucks of all kinds.

MANUFACTURER OF

ALL KINDS OF STEAM ENGINES AND MILL WORK GENERALLY.

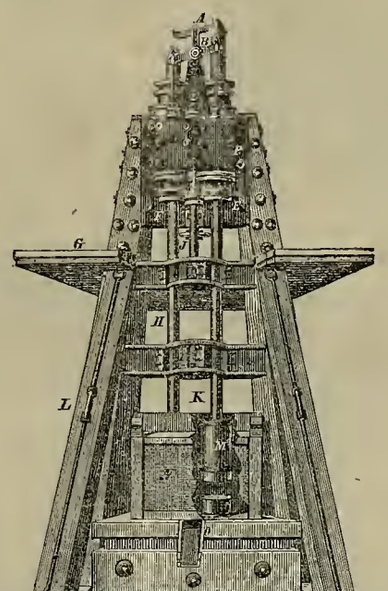
☞ JOBBING PROMPTLY ATTENDED TO. ☜

SOLE AGENT FOR TAFT'S PATENT SHEARS AND PUNCHES.

13v19-16ptf

TAYLOR'S IMPROVED

STEAM STAMP MILL.



☞ This Mill is driven by a direct application of steam to the stamps. It saves from fifty to seventy-five per cent. of the cost of the ordinary stamp battery, performing the same amount of work.

Cost of Mill with a capacity of 25 tons per day, $2,500.

THIS MILL IS LESS COMPLICATED

THAN ANY OTHER IN USE,

And, consequently, much less liable to get out of repair. See illustration and detailed description in the *Mining and Scientific Press* of October 30th, 1869. For further information, reference may be made to PRESCOTT, SCHIEDELL & Co., Marysville, or address

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 25 pourings of brass. GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gent's:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

18v18-9p 519 Front street, San Francisco

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 15v6-1y16p

Mechanical and Chemical Losses of Mercury.

The inefficiency of quicksilver attributed to "flouring" and "cutting up," may be due in many cases to mechanical causes, as will be understood after a visit to the quicksilver reduction laboratory of Mr. John Roach, or the works of New Almaden. The mercurial fumes condense in water into what is known as floured quicksilver; and if the ores producing them have been poor, the particles will not unite into *quick*-silver until they are subjected for some time to a special process of drying. The very minute globules of quicksilver have become coated with a film of water, gas or air, which suspends the alloying and cohesive tendency of the metal. Similar results may be produced by amalgamation in battery, to account for low percentages of return in proportion to the contents. But silver amalgamation, and so far as the mercury is concerned, gold amalgamation likewise, are chemical processes in the wet way in addition to the mechanical amalgamation; and there are many well known and well understood causes of loss of mercury that can easily be avoided by merely being understood.

Certain of the California gold ores that contain gypsum as gangue (sulphate of lime) will not mill to one-third of the assay. Mr. Rickard reports his observation that, particularly in Chili, and in some parts of Mexico and Nevada, carbonate of lime is found in large proportions in gangues of silver ores; and when amalgamation is the process of reduction adopted, says very heavy losses result from the impossibility of roasting the ores previous to, or the tailings after, amalgamation, such roasting having the effect of generating caustic lime, which in contact with the mercury in the amalgamating vessels, occasions a ruinous loss of that metal, while it sickens the remainder, and checks, or entirely stops, the amalgamation of the silver. This inconvenience was so great some years ago in Chili, that a reward of $20,000 was offered by the Government for the introduction of a process that would enable the ores to be *entirely* reduced in the country, the practice having been to extract the native and chloride of silver existing in the ores by direct amalgamation, and ship off the tailings (relaves), containing the metal in the form of sulphide—antimonial or arsenical silver—to Swansea, for furnace treatment; or if too poor to bear this expense (about $40 per ton), they were thrown away.

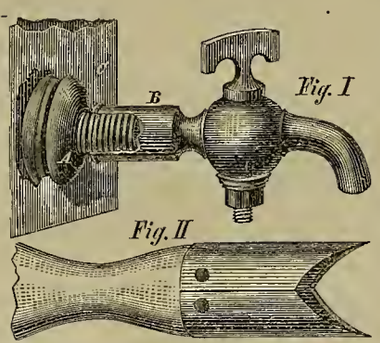
To get around this difficulty in amalgamation, as well as the depreciation in manganese ore by presence of lime, Mr. Rickard extracts the carbonate of lime by a simple process, separately.

In the mechanical process of amalgamation, whether it is "rusty gold" that is coated, or the mercury itself which refuses to do its duty, the result would of course be the same.

THE Hale and Norcross cross cuts, at their sixth level, have discovered an additional rich body of ore.

Hall & Garrigan's Device for Securing Faucets, Tubes, Etc., to Cans.

We give herewith an illustration of a new and improved device for securing, without the use of solder, faucets, tubes, pipes, etc., to tin or other thin metal vessels, such as oil cans, etc., from which liquids are drawn. This device is intended to so bind or secure the faucet, tube or pipe to the vessel that the liquid will not be wasted in drawing it off, while the manner of attachment is such that the vessel will not be thereby injured. The invention is especially adapted for the use of families, hotels, druggists, painters, and all consumers of, or dealers in, oils or other fluids, which are kept in thin metallic vessels. It is also valuable as a connection for bath tubs, copper and tin boilers, gas meters and holders, tanks, feed-pipes; also rubber and leather vessels, etc.



HALL & GARRIGAN'S DEVICE FOR SECURING FAUCETS, ETC.

In order to understand the principle and use of the device, we will suppose we have a five-gallon can of oil to open. The can should be turned down on its side, and an elliptical hole made in the proper place, by the cutting instrument shown in fig. 2, which may be done by a slight pressure of the hand. The cutter consists of two thin sheets of steel, bent into an elliptical shape, and properly affixed to a convenient handle, as shown. Having cut the hole in the can, a plate, having a perforated tube inserted through its center with a small thread cut upon its outer end for the reception of a faucet, as shown in fig. 1, is inserted in the hole precisely as a head or man-hole plate is inserted in a steam boiler. This plate having been put in place in the usual manner, and brought to its bearing against the inner surface of the can, another plate, similarly made, is placed against the outer surface, and the faucet screwed up to its place, which action presses the two plates firmly against the outer and inner walls of the vessel, in such a manner as to make a perfectly tight joint. For greater security a thin piece of soft leather is placed as a washer between the inner plate and the inner wall of the vessel.

It will readily be seen that by this device a faucet, tube or any other connection may readily be made, by which the fluid can be drawn off, without waste or trouble, or the use of solder, and when one can has been emptied of its contents, the device may be readily removed and applied to another. This apparatus is so simple that it may be employed by a child, and so perfectly effective and generally useful that it should come into very general use everywhere. It has been patented through the M. & S. PRESS PATENT AGENCY, for Messrs. Francis L. Hall, of San Francisco, Cal., and John H. Garrigan, of Portland, Oregon, who are prepared to dispose of County or State rights to manufacture and sell, or they will dispose of the right for the entire Union upon reasonable terms.

CALIFORNIA MEDICAL GAZETTE.—MRS. WINSLOW'S SYRUP.—The November number of this journal contains, besides an unusually large amount of matter especially interesting to the members of the medical profession, an article upon a subject which concerns every mother in the land. It is "Mrs. Winslow's Soothing Syrup." The writer, who is alluded to in a note to an editorial upon another page of the same journal as "a distinguished physician of this city," has had a specimen of this nostrum analyzed; being led thereto by the fatal poisoning of an infant to whom it had been administered. The analysis revealed the fact that if the printed directions accompanying the medicine are followed, an infant of six months is in danger of being dosed with opium to an extent which would hardly be safe for an adult. This is no guess work; *the figures are given.* The annual sale of this child-killer in this city is *one hundred thousand bottles.* No wonder,—says the writer,—that one-third of the babies in this State die before they reach the age of two years!

LATEST BY TELEGRAPH.—The Los Angeles and San Diego telegraphic reporters, daily report the discovery of rare gold mines somewhere within reach of either of those places. The Los Angeles man is highly excited about the discovery of gold at "Placerito"—anywhere in the mountains—and announces that "an experimental assay will soon be made." At San Diego the town is "excited," but the locality has not yet leaked out. Thanks for the latest information.

The Literary Forgeries.

Our readers will remember that some time since we alluded to the papers presented to the French Academy by M. Chasles, purporting to be letters of Galileo and divers other notables,—but the authenticity of which was doubted. It turns out that M. Chasles himself was hoaxed. A little dried-up Frenchman manufactured the whole of the documents, at various times, one after the other; having "struck a good thing" in the credulity of that honest savant, from whose pocket he wormed out, first and last, no less than $30,000. Monsieur C. is almost heart-broken; not, of course, at the loss of his money, but at his disappointment in learning the literary worthlessness of his treasures. The papers numbered several thousands. Letters of Copernicus, of Christopher Columbus, of Louis XIV, of Mme. de Sevigné, and a dozen others,—poetry in Shakespeare's own hand-writing, choice tit-bits by Dante and Tasso, and stories by Boccacio, were turned out by this fellow with perfect looseness. The wonder is that one individual could possibly have done it all, even though his talent might be of the most varied character. He has been arrested and has confessed.

THE CARNIVAL BALL.—The second grand masked ball given under the auspices of the Mechanics' Institute, took place on Tuesday night, November 9th, and served as a brilliant finale to the Fair of the preceding weeks. During the week subsequent to the closing of the Fair, the Pavilion had been cleared of everything but a few large pieces of machinery, leaving the central part of the hall entirely vacant, save at the fountain. This part, which formed the dancing floor, was enclosed by pink muslin, upward to the lower gallery, and the floor was covered with white canvas. The hall was decorated with the flags of all nations, and the light of twelve hundred gas burners falling upon the rich and varied costumes of the maskers, formed one of the rarest sights ever witnessed on this coast. Upwards of five hundred couples were on the floor at one time, and the galleries were literally crowded with spectators, many of whom joined the dancers after the unmasking. Between one and two o'clock, President Hallidie announced the award of prizes for the best sustained comic characters during the evening. The first ladies' prize was won by Mrs. Adelaide McDonald as "Hot Corn." The second by Mrs. James Duff as "Topsy." The first gentlemen's prize was awarded to C. C. Keene—"Chinese Fish Vender." The second to T. Gorham—"A Japanese." Almost the only fault to be found was with the supper, which was a most miserable affair for the price charged, while the principal aim of the waiters seemed to be, not to furnish any coffee or water, to the end that they might sell the unfortunate victims wine, which was not wanted. In justice to the Institute, it should be said that the supper was furnished by outside parties. The total receipts from the sale of tickets for the Ball were $5,500, the expenses amounting to $3,500.

The Veins, Minerals and Metallurgy of Colorado.

Mr. A. D. Hodges, Jr., a competent young mining engineer who recently visited, and pretty extensively examined, the mines of Colorado, has furnished valuable notes on this subject, which have in part already appeared in the *Engineering and Mining Journal*. From this and other sources we compile for this issue the following facts and figures:

The Country Rock

Around Central City is gneiss. Often the grains of quartz and feldspar on the one hand, and the mica on the other, occur in alternating seams or layers sometimes an inch or more in thickness, and in some places there are two sets of these bands crossing at right angles.

Veins and their Contents.

The gold veins have a general course of northeast and southwest. The gangue generally appears to be a mixture of quartz and feldspar, coarse to fine-grained; the feldspar of which often speedily decomposes on exposure. The width varies greatly, from a few inches to ten or fifteen feet; and in a number of the mines I visited, two to three feet of "pay rock" is not too high an average, at least for a considerable part of the workings. The minerals are principally iron and copper pyrites, with more or less galena and zinc-blende. Several of the mines at Nevada are especially rich in galena. In Pleasant View mine, near Central City, small crystals of carbonate of lead (cernsite), impregnate the vein matter; and anglesite is said to be about as common, although I cannot say that I saw any very certain specimen. Tetrahedrite occurs in several veins. Native copper has been found in the Gregory lode (among other places), and a specimen was shown me from the "Rising Sun" on Quartz Hill. In the veins rich in galena, I have found iron spar and dolomite.

In all these gold veins silver occurs in varying amounts, often far exceeding the gold in weight; but this is almost entirely lost in the stamp mills, or obtained in such quantities in the gold as merely to reduce the value of the more precious metal. Hence little or no account is taken of it, and it is impossible to obtain correct information on the subject at the mines or mills. For ten to sixty feet from the surface, the so-called "surface-quartz" is found. This is a light, porous, yellowish quartz material, formed apparently by the decomposition of the pyrites and of the feldspar of the gangue, and in which the gold occurs mechanically mixed in small grains and scales. It almost always gives quite an amount of gold on "panning," and presents no difficulty in amalgamating, being easily crushed and freely yielding its gold to the mercury. Under the surface quartz comes, generally, but not invariably, what is here called "cap rock," sometimes reaching a depth of two or three hundred feet. Of course "cap" is no proper rock, but is the general name given to matter that doesn't pay. Below the cap—and in some instances immediately below the surface quartz—come the pyrites, copper and iron, in variable proportions, mixed with the other minerals. It is commonly asserted that the copper pyrites are richer in gold than the iron, but this is a matter that remains to be tested; and the very general assertion that the veins grow richer the deeper one goes, also needs confirmation.

Richness in Gold and Silver.

The gold in the ore does not occur regularly, but is richer in some places than in others, both in a horizontal and in a vertical direction. It appears impossible to tell, from the mere external looks of the ore, how rich it may be, different heaps from different mines, often exactly alike in appearance, varying greatly in the amount of gold contained and in the ease of working. As far as I have seen, I should say that the average of the ores around Central might be four to five ounces of gold to the cord, but certainly no more; and every day mills are crushing ores which do not pay the mill charges.

Classification and Treatment of the Ores.

The gold ores of Central are divided into two classes: 1st class, of smelting, and 2d class, of mill ores. Of the relative amounts of these produced at individual mines, it is impossible to obtain accurate information. The general proportion given by the miners is 10 ton of 2d class to one of 1st; but this, although true, perhaps, in a few cases for short periods of time, is obviously incorrect in general; for not only is the quality of an ore continually changing in a mine, but some veins produce no 1st class ore. On comparing the amounts received at Professor Hill's works with the estimated amount crushed by the mills, it would appear that not one per cent. of the ore is 1st class. First class ore in general is such as yields at least 2 oz. of gold to the ton, this being about the lowest grade received at Hill's works. Second class ore *may* run higher than this, if the owners choose to have it milled instead of smelted. I use the terms 1st and 2d class because I find them in common use here. They mean merely ores sent to Professor Hill, and ores stamped in the mills.

Smelting for Matte.

The treatment of the ore by Prof. Hill is very simple, consisting in roasting in heaps and in reverberatory furnaces, and in smelting for matte. The common run of ore in pieces is roasted in heaps; the roasted product is then pulverized, and with the richer lead ores and the tailings from the stamp mills, is roasted in a reverberatory furnace. The roasting furnaces are of the class which has the floor or hearth divided into three parts, each part holding a separate charge, and being a few inches lower than the preceding. There are two such furnaces, which together roast 7 to 8 tons in 24 hours. There are, moreover, two common reverberatory smelting furnaces, each of which is charged with two tons of roasted ore every 8 or 10 hours. The resulting matte is shipped to Swansea, England, for further treatment.

Ore Prices.

The following is the scale of prices for ore delivered at the works, which are situated on North Clear Creek, some little distance below Black Hawk: For gold—For ore holding 2 oz. gold per ton, 20 per cent. of the value of the gold is paid; 3 oz., 30 per cent.; 4 oz., 40 per cent.; 5 oz., 45 per cent.; 6 oz., 50 per cent. For silver—75 cents per oz., after deducting as many ozs. of silver as there are per cent. of copper. For copper—$2 for each per cent., deducting 1½ per cent. from the result obtained by wet assay. No account is taken of fractions of an oz. of silver or of a per cent. of copper; gold is paid by the ¼ oz. The above values are in gold. These prices appear very small; still, when wood for fuel costs $5 to $7 per cord, and where smelters are paid $5 to $7 per day, the cost of smelting must be very large.

Battery Amalgamation of Second Class Ore.

The 2d class ore is not weighed but measured, the unit of measure being the cord, (128 cubic feet) which varies in weight between 6 and 14 tons. This class is worked in the stamp mills. These mills have commonly a simple construction. The stamps, consisting of stem, collar, head and shoe, are of iron and are revolving. Their weight varies from 400 to 800 lbs., the smaller weights being, however, unfrequent. The fall is from 10 to 14 inches, and the number of strokes per minute 25 to 30. The stamps play into rectangular cast-iron mortars, which have in the bottom and directly under the stamps, circular cavities, in which lie loosely the dies. In the mortar boxes two amalgamated copper plates are fastened, one before and one behind the stamps. These plates are sometimes fixed, and sometimes movable. A battery consists of 4 to 6 stamps. The screens before the stamps are of copper plate with horizontal slits, or of wire. Before the batteries are the tables, which generally are fixed, instead of being constructed so as to allow of different inclinations according to circumstances. The inclination of the tables in several mills, I found by measurement to be 1 in 7. On inquiring how the inclination was determined, the invariable reply was, that "the carpenter fixed that." The tables are lined with amalgamated copper plates, which are prepared generally by washing the copper plates (after they are fastened on the table) with a strong solution of cyanide of potassium until a bright surface is obtained, and then rubbing on mercury, the tables then being covered with a mixture of lime and sal-ammoniac until used. The operation of rubbing on mercury is repeated several times. On first running over ore, a large amount of the gold is taken up and remains permanently on the plates, gold amalgam readily settling fast on solid bodies. Below the copper plates are laid the blankets for catching the amalgam which is carried over the tables. The mass which passes the blankets either is lost, or is collected in tanks and buddled or washed in a rather primitive manner.

From the data given at the various mills, it would appear that a battery of 5 stamps will crush, on an average, ¼ cord of pyrites ore, or ¾ cord of surface quartz in 24 hours. About ⅓ of the gold obtained is found on the copper plates, which are inside the mortars. The amalgam is obtained by scraping the plates with rubber scrapers, after which more mercury is thrown on the plates. The tables are cleared once in 12, or once in 24 hours. The blankets are washed in tanks usually about every half hour. The blanket tailings thus obtained are generally amalgamated in pans, the Bartola being the favorite.

The Losses in Working.

It is impossible to state accurately what percentage of the gold is lost in milling, as no assays are made either of the crude ore or of the tailings, but that a very large amount is lost cannot be doubted, and this loss probably varies from 30 to 70 per cent., according to the nature of the ore. None of the silver is saved, except a small quantity, which, being obtained in the gold, merely diminishes the value of the latter metal.

Attemps at Concentration.

There are some variations from the above in some of the mills. For instance, in one case I found the ore from the battery passed over a shaking table of the Keith pattern—*i. e.*, with a bottom of corrugated plates. The mass from the tables passed into Cornish buddles for concentration, and was then amalgamated in Bartola pans This method, however, did not work particularly well, and millmen generally seem inclined to stick to the stamps and stationary tables. Attempts to work over the tailings from the mills are now beginning to be made, and thus undoubtedly much precious metal will be saved, some of the tailings being quite rich. Among other experiments at the Black Hawk Mill, the Rittenger percussion table is being tried.

Value per Ton, and Choice Between Milling and Smelting.

The Central City *Register* of October 14 says it must not be assumed that as two-ounce ore is the lowest grade named in Hill's schedule, therefore *all* the two-ounce ore is sold at those works; a very small proportion of two-ounce or even three-ounce ore being sold to the smelting works, "for the reason that a much larger net profit is realized by milling it and selling the concentrated tailings."

The price at the smelting works for two-ounce is $8 in gold, or say $10.80 in currency. The ordinary yield in a stamp mill for this class of ore is about $15 per ton in gold, or $20 in currency. The cost of milling, including the concentration of the tailings, is about $5 per ton, which leaves a margin in favor of milling of at least $4.20 per ton. Add to this the value of the concentrated tailings, which will vary from $2 to $5 for every ton of ore, and "it is clear that no miner can afford to sell that grade of ore upon the Professor's schedule. It is therefore quite unfair," says the *Register*, "to deduce so damaging a conclusion as that 99 per cent. of our ore is of a grade below two ounces per ton."

Rate of Stamp Drops.

With the bulk of ores a low rate of speed is better calculated to save the gold, while with some ores it has been found that sixty drops per minute is a better speed than twenty-five or thirty per minute. Mr. John Kip proved this so far as the Bobtail Company's ore is concerned, by increasing the speed of the Kip & Buell mill to sixty drops per minute, with a very considerable increase in the yield of gold. On the contrary, Messrs. Standley & Stalker find that ore from the California yields higher under a low rate of motion.

From a Metallurgical Stand-point—The Profits.

In correction of some too highly colored statements, so deemed by Mr. Hill, touching the profits realized from reduction by fire, that gentleman writes to the London *Mining Journal* of September 11th, a communication, from which we are enabled to extract the following pertinent facts and figures. The statement of Mr. Wincope, of the British and Colorado Mining Bureau, was to the effect that Mr. Hill forwarded overland, more than 5,000 miles, seventy tons of ore, for reduction at Swansea, the net profits of which transaction were $6,886 (coin), and that Hill's works were the largest in the country, and the owners are making immense fortunes. Mr. Hill replies: "That the ores forwarded to Swansea were purchased by the representative of a New York and Boston house, and were sent overland 700 miles, instead of 5,000 miles, as stated. This is the distance from our mines to the Missouri river, from which they were sent by water transportation to Swansea; that the net profits of the transaction were minus $400, instead of plus $6,886. In other words, the investors lost $400. If they had paid for the same lot of ore the price which such ores command here now, and shipped it to Swansea, or should ship it to Swansea now with the advantages of improved modes of transportation, the loss on the transaction would be between $4,000 and $5,000."

He continues: "The smelting establishment which I am managing consists of two reverberatory furnaces, one of which is not used now for want of ore. That this statement may not give to those not acquainted with this country an incorrect impression of its resources, I should state that there is a very large quantity of productive material taken from our mines. More than 99 per cent. of it is a quartz gangue, which contains free gold in moderate quantities. This material can be worked by amalgamation, at a very small cost, and profitably. The entire gold which it contains would not be sufficient to cover the cost of smelting it, to say nothing of the cost of mining. It is only the iron and copper pyrites which can be smelted, and the proportion of these, as indicated above, is small."

Shellac Varnish.—The solution of shellac in borax does not answer well as a varnish, on account of the quantity of borax dissolved. But the solution in ammonia, serves a good purpose. Puscher publishes some suggestions for making varnishes of various colors with it. Most of the insoluble earthy colors may be mixed with it. Sulphate of lime, however, is said to decompose the solution. Extract of logwood easily dissolves in it, so likewise does aniline green. We have long employed it to make an indelible ink, which is especially useful for laboratory labels, a mixture of lamp-black with the shellac solution remaining quite unaffected by acid vapors. The colored solutions are, in fact, available for many decorative purposes. The plain solution is made by macerating three parts of white shellac in one part of strong ammonia diluted with six or eight parts of water. This mixture must be frequently shaken for twelve hours, after which the solution may be completed by the application of a gentle heat.

Corns Cured.—*Hall's Journal of Health* gives this mode: "The safest, most accessible and the most efficient cure of a corn on the toe, is to double a piece of thick, soft buckskin, cut a hole in it large enough to receive the corn, and bind it round the toe. If, in addition to this, the foot is soaked in warm water for five or more minutes every morning and night, and a few drops of sweet oil, or other oily substance, are patiently rubbed in after the soaking, the corn will almost infallibly become so loose in a few days as to be easily pricked out with a finger nail; this saves the necessity of paring the corn, which operation has sometimes been followed by dangerous symptoms. If the corn becomes inconvenient again, repeat the process at once."

Lemons and sugar are strongly recommended to feverish invalids by *Hall's Journal of Health*. Two or three lemons a day may be taken with decided benefit. A lemon or two, according to the above mentioned authority, taken with sugar, as an entire substitute for supper, would give many a man a comfortable night's sleep and an awaking of rest and invigoration, with an appetite for breakfast to which they are strangers who will have their regular supper.

Apples for Food.—Apples, if eaten at breakfast, with coarse bread and butter, without meat or flesh, remove constipation, correct acidities, and cool off febrile conditions more effectually than the most approved medicines. They prevent debility, strengthen digestion, correct the putrefactive tendencies of nitrogeneous food, avert scurvy and strengthen the power of productive labor.

A Jump.—A man recently jumped from the third-story window of a house in Boston, on a wager. He held over his head a large and strong spread umbrella, by the aid of which he accomplished the feat without harm to his person. We trust no one else will be so foolish as to follow his example, as it must be to the greater or less risk of life and limb.

Largest Employer.—Senator Sprague is said to be the largest employer in the United States. He gives work to about 8,000 persons, and has recently raised their wages fifteen per cent.

Mechanical Progress.

The Palliser Lock-Nut.

The loosening of fish joints in railroads is a constant source of annoyance and expense. Once loose, the difficulty increases, and the wear and tear of the rolling stock, owing to the constant blows which the wheels strike themselves in passing over the loosened rail-ends, becomes a serious item. The means of prevention have been diligently sought after for twenty years. Patents upon patents have been issued for devices, all having for their end the locking of the nuts upon the bolts in such a manner that the jar to which they are subjected will not cause them to turn. Major Palliser some time since contrived a bolt, which was so shaped as to have the merit of elasticity and admit of slight elongation. These have done good service,—but the nuts would nevertheless gradually work loose; the same gentleman has now designed, to accompany this bolt, a "lock-nut,"—which is described and illustrated by the London *Engineering*. We quote: "Two nuts are employed, the one of an ordinary form, fitting freely on the bolt, and with a conical recess in the outer side to receive the cone of the lock-nut, which is screwed upon the bolt, at the rear of the other. It will be seen that there is a saw cut through one side of the lock-nut, to give it elasticity, and to grip the bolt as it is screwed up within the coned recess of the inner nut. By this means any amount of locking may be obtained, until the rear nut is home upon the front one, and the cut in the former is almost closed. It is one of those devices which recommends itself at first sight. The nuts cannot run back, being bound so firmly one by the other; they cannot rust up, for the inner nut is too slack and the rear one too tight around the threads to do so; or if through long neglect this should happen, the first half turn of the lock-nut releases it by reason of its own elasticity. In the same manner there is but little danger of the bolts being broken short in tightening them up, which is a matter of daily occurrence with ordinary fastenings, for as the bolt is reduced in the shank, the screwed part always retains its original pitch and form, and therefore its original strength, whilst the freedom with which the nuts can be released prevents all danger of undue stress upon the screw.

One hundred of these bolts and nuts have been under trial for the last two months on the Great Northern, and have, without exception, remained perfectly tight."

Hydraulic Buffers.

Col. H. Clerk, R. A., F. R. S., recently read a paper before the British Association upon the effect of water used as a buffer to check the recoil of heavy guns, in which he describes an arrangement for the purpose, submitted by him to the Secretary of War. We find it given in the *Engineer* for October 15th: "It consists of a wrought iron cylinder closed at one end, the other end fitted with a cap and stuffing-box, through which a piston rod passes. The length of the cylinder and piston rod are regulated by the amount of recoil required. The piston fits well into the cylinder, and is perforated with four small holes. The ratio between the diameter of these holes and that of the cylinder is determined by the amount of work required to be performed on the water with which the cylinder is filled, enough air space being left to allow of the displacement of water by the length of the piston rod due to the recoil. This air space also acts as an elastic buffer, and takes off the violence of the first impact of the piston on the water. The cylinder is firmly attached to the platform on which the carriage recoils, and the end of the piston rod to the carriage itself; so that on the discharge of the gun the carriage drives the piston through the water with an initial velocity V, whilst the water has to pass through the holes with an initial velocity R V, R being the ratio between the area of the cylinder and of the holes. This buffer has not only been used on shore with guns up to twenty-five tons weight, but also at sea, with light guns of only 1¼ cwt. and 8 cwt. in boats, and lately with 9-in. guns of twelve tons on board H. M. S. Prince Albert, in all cases with equal success.

In place of water it has been recommended to use oil, as there is less chance of corrosion taking place if the cylinder is kept full for any lengthened period, and no danger of the fluid freezing in ordinary frosts. The satisfactory manner in which this buffer has worked in checking the recoil of a gun of twenty-five tons weight leads me to anticipate that it could be usefully applied towards preventing, or diminishing, the destructive effects of a railway collision."

The "Mahovos."

We take the following from the report of Mr. Auchincloss, on steam engineering at the Paris Exposition: "A curious invention has recently been produced by Mr. C. Schonberszky, of St. Petersburg. Its object is to dispense with steep gradients on railways by the addition of a carriage to each train which shall act the part of a storehouse for momentum developed during a descent, whence it may be reproduced at will and assist the locomotive on the opposite ascent. He has given the title of 'Mahovos' to this new motor, and introduced a working model in the Russian department of the Exposition. The track for the same is 110 feet in length, having a rise of four feet in this distance. Near its lowest point is a turn-table for reversing the 'Mahovos' and a tank to receive the water contained in its train of five cars. The model weighs 275 pounds. The drawings accompanying the report, show two ponderous fly-wheels, resting by means of rollers upon a central pair of wheels, which run upon the track between two larger truck wheels. The five cars filled with water are coupled in front of the 'Mahovos' at the top of the grade. When ready for starting, the two large fly-wheels are lowered until their axle rests on the four friction rollers, and these in turn on the six carrying wheels on the truck through the medium of four rolls on their shafts. Under the impulse of gravity, the train commences its slow descent, during which a high velocity is ultimately imparted to the fly-wheels. It reaches the turntable after a lapse of two minutes. At this point the cars, being detached, continue their journey until the tank is reached, into which having discharged about 800 pounds of water, they are then led back to the turn-table. In the meantime the fly-wheels with their shaft are raised out of gear, the 'Mahovos' turned end for end, and made ready to re-ascend after the coupling of the cars takes place. This being accomplished, the fly-wheels are lowered a second time, when the cars rise quickly to the starting point."

NEW TREADLE MOTION.—From the *Artisan's* American Institute Fair notes: The two saws running by foot-power are by Quinby, Chambers street, and Hoag, of Pearl street, New York. In each are exhibited a new treadle-motion. In the Quimby machine, the motion given to the fly-wheel shaft is produced by clutches driving it in one direction as the treadle is pressed down, which treadle, on being released as the foot is raised, is thrown back by the action of a spring ready for another forward action. One motion of the foot gives three revolutions to the shaft. In the Hoag machine the reciprocating motion is given to the saw by two arms placed opposite each other on the fly-wheel shaft, revolving between two belts, and as the arms revolve the belts are forced apart, and when the arms assume a vertical position the belts are brought together by a how spring to which the saw is attached.

A NEW FORM OF STEAM ENGINE.—One of the engines on exhibition at the American Institute Fair, had the slide valve within the piston, which was hollow. The *Artisan* illustrates and describes it, and says "its essential feature consists in the arrangement of a reciprocating cylinder with a piston, stationary with reference to each cylinder, both being hung to have a rocking movement upon a trunnion,—constituted by the rock shaft,—disposed beyond the stroke of the cylinder, the valve and appliances thereof governing the motion of the cylinder being arranged within the piston."

GRINDSTONES.—It is well to reverse the motion of a grindstone at intervals. The "grit" is thus made to keep itself "sharp."

Scientific Progress.

Polarization of the Light from the Corona.

Prof. Pickering, of Boston, read a paper upon this subject before the American Association at its recent meeting, of which we find an abstract in Prof. Wurtz's *Chemical Repertory:*

"In order to observe the degree of polarization of the corona during the late eclipse, I prepared an Arago's polariscope, which consists of a tube closed at one end by a plate of quartz, and at the other by a double image prism of Iceland spar. Looking at any object through the latter, we see two images, which, when the light is polarized, assume complementary tints.

If, as is generally supposed, the corona is polarized in planes passing through the sun's center, its two images would be colored in such a way that every part would be complementary to that at right angles to it. Thus the top and bottom being blue, the sides would be yellow, while in the second image these colors would be reversed. In reality, however, both images were precisely alike and pure white, but one was on a yellow, the other on a blue background. Hence the corona was unpolarized, but the sky adjoining it was polarized in a plane independent of the position of the sun, since its color was the same on all sides of the latter. This curious effect may be explained by assuming that the earth outside of the shadow acted as an independent source of light, and thus caused polarization in a plane perpendicular to the horizon."

SEX IN PLANTS.—At the Salem meeting of the American Association, Mr. Thomas Meehan read a paper "on the laws which govern the production of sexes in plants." He showed that extra vigor or vitality determines the production of female flowers, instead of male, in the coniferæ. Only the strongest spurs, in the Larch, produce female flowers; male flowers appear after two or three years of weakening by the shade produced by increased growth of branches. The vitality is by that time so low that the whole spur dies. The same law, in various forms, prevails in the Amentaceæ, and others.

The Norway spruces, and those species generally which were the hardiest individually, or in comparison with other species, had greater powers to produce female flowers. Not so easily seen, but yet evident was the law in hermaphrodites as in monœcious plants. In many hermaphrodites there was known a tendency to become unisexual, sometimes in the male, sometimes in the female direction. A general debility follows the male in such cases, and increased vitality the female. *Viola Fragaria*, and other instances were given in favor of the latter point, and double flowers, variegated plants, etc., as instances of degeneracy to male weakness. The conclusion drawn from the facts given was, not to establish the theory, but to excite investigation whether it was not *the highest types of vitality only which take on the female form?* He concluded with the bare suggestion that the same laws might prevail in the animal world.

ANOTHER ASTEROID DISCOVERED.—On the night of the 9th ult., Dr. C. H. F. Peters, the astronomer of Litchfield Observatory, Hamilton College, discovered a new planet. It is the *ninth* discovery of the kind to his credit. Dr. P. writes thus the next day, to the Utica *Herald:*

"A new planet was discovered here last night, at about midnight. It belongs to the asteroids, and will bear the number 109 of that group. From repeated measurements the position resulted, for half-past one o'clock, fourteen degrees and one minute in right ascension, and nine degrees thirty-seven minutes in north declination, with a rapid motion almost parallel to the equator. Its brightness is equal to that of a star of tenth magnitude, and it has just passed its opposition with the sun."

PROF. MORTON ON THE CORONA.—It would seem almost certain that *the corona is simply an electric discharge*, no doubt varying with great rapidity, as we see in the case of the aurora; and to its variations we may attribute those apparent motions of the prominences which have been observed by so many, but which our large series of photographs so conclusively shows not to have had any actual existence.

THE FOSSIL GIANT.—John F. Boynton, Geologist, writes Prof. Morton of the Pennsylvania University, describing the ten-foot stone giant recently exhumed near Syracuse, New York, and says, that after a careful examination of it he has come to the conclusion that it is not, as was thought by many, a "petrified" man, but a statue, cut in sulphate of lime, probably quarried somewhere in the county. He refers it to the date of the Jesuit Fathers in the country, who occupied the Onondaga Valley some 225 years ago; and concludes that it was buried for the purpose of protecting it from an enemy who would have destroyed it. It was carefully laid down and covered with boughs and twigs; traces of vegetable matter now, of course, decomposed, being found all around it.

ORCHID REPRODUCTION.—Mr. Darwin says in a note to his work on the "Fertilization of Orchids": "I have endeavored to estimate the number of pollen-grains produced by a single flower of *Orchis mascula*. There are two pollen-masses; in one of these I counted 153 packets of pollen; each packet contains, as far as I could count, by carefully breaking it up under the microscope, nearly 100 compound grains, and each compound grain is formed of four grains. By multiplying these figures together, the product for a single flower is about 120,000 pollen-grains. Now we have seen that in the allied *O. maculata* a single capsule produced about 6,200 seeds; so that there are nearly twenty pollen-grains for each ovule or seed. As a single flower of a *Maxillaria* produced 1,756,000 seeds, it would produce, according to the above ratio, nearly 34,000,000 pollen-grains, each of which, no doubt, includes the elements for the reproduction of every single character in the mature plant."

AN ELECTRICAL EXPERIMENT.—"If a Leyden jar or a sheet of glass be coated upon each side within a short distance of its edge with metal foil, and a battery of high tension be applied, one pole to one side, and the other pole to the opposite side, the two surfaces of the glass acquire the same tension as the battery-poles; and as the intervening glass is an exceedingly bad conductor, these surfaces will retain their respective electrical states even after the battery is withdrawn, until connected by a better one; and when they are so connected, the discharge of this tension passes through the conductor and becomes manifest upon a galvanometer placed in its circuit. The proof that the charge is an effect distinct from the constant flow of the current caused by any leakage in the dielectric is, that as soon as the surface is charged, the galvanometer needle will return to zero, although the battery contact is maintained."—*Scientific Review.*

OPAL IN THE SPECTROSCOPE.—Prof. Crookes finds that when an opal emitting a crimson light, is placed before the slit of the spectroscope at a determined angle, the field appears uniform in tint, being reduced to a luminous band somewhat variable in breadth, and irregular in outline, though well defined and appearing very brilliant on a dark background. If now the source of light be so changed in position as to permit the light transmitted by the opal to enter the spectroscope, the appearance is entirely reversed, a luminous spectrum being obtained which has a black absorption band in place of the red, identical in position, form and outline with the red band previously seen. This, together with other analogous experiments, proves that those portions of opal which emit red, yellow, green, or blue rays are opaque for light of the same refrangibility as that which they emit.

THE SPECTRUM OF THE FIRE-FLY.—Prof. Young says: "The common fire-fly gives a continuous spectrum without any trace of lines, either bright or dark. It is noteworthy that this spectrum lies almost entirely between the lines C and F, the portion of the luminous diaphason where the thermal and actinic effects are nearly nil, and where almost all the energy expended is effective as pure light. How different from our artificial modes, in which not more than one-tenth of one per cent. of the expended energy appears as light, the rest being mostly wasted in heat, and partly in actinism."

URANIUM SALTS NOT FLUORESCENT.—M. Selhorst announces that the salts of uranium do not fluoresce in Geissler tubes. This is contrary to the statement of Becquerel,

Farming and Gardening.

The Flow of Sap in Trees.

It may be interesting in connection with another article on this page, in reference to the girdling of the trees in a large fruit orchard, to consider here, for a moment, the philosophy of the flowing of sap in trees, of which very erroneous opinions are generally entertained. Until quite recently, it has been taught that two opposite currents exist—that the "crude sap" taken up from the soil, by the roots, ascends to the leaves, where it is "elaborated," and thence descends through and along the vessels of the inner bark, depositing in its downward flow that which goes to increase the growth of the wood, much as blood circulates in the arteries and veins of animals. Although to a certain extent this may be true, it is by no means the entire truth. The conception, as a whole, is quite erroneous.

The conditions under which sap flows are various. In the spring, while the stems are yet enveloped by an almost impervious bark, and the buds by hard, horny scales, there can be very little if any movement of sap; although a rapid downward flow of liquid will be observed if the bark and outer wood is penetrated, as in the sugar maple, the grape vine, etc. The copiousness of this flow, in the maple—several gallons a day for two weeks or more, from a tree of moderate size—is evidence that the supply must be kept up from the earth, through the roots. This, however, is an artificial movement.

But when the buds have unfolded into leaves, a rapid evaporation ensues from their surface, and an upward and natural movement of sap commences. This flow is direct to the leaves, where it is properly elaborated, compounded with carbon, from the carbonic acid of the atmosphere, and with nitric acid and ammonia, in addition to that which it has already brought up from the roots. When thus prepared, it finds its way to the proper points for building up the plant, in a large measure, by a process of *slow diffusion*, through the *walls* of the wood cells, rather than by way of their channels. This process goes on to a greater or less extent in all directions; but in plants which build up their substance by successive layers upon the outside, the movement is mainly by way of the inside bark, or "cambium," as it is technically called, which has a direct connection with the tissue of the leaves; in fact, the leaves being mere continuations of the inner bark, in plants where such bark exists. In plants which have their increase from the circumference inward, this process proceeds altogether through the cellulous fibre.

While the new cells or wood is forming on the outside, the walls of the old cells are constantly growing thicker and stronger, by slow aggregations from this elaborated fluid. This process is what makes the "heart" of the wood so much better and stronger than the outside or "sap." Its cells are finally so filled up with fibre, as to render the passage of sap through them an impossibility by any force which nature employs for such purposes.

The colored heart wood which exists in many trees, contains no water or sap; its process of formation, as we have just said, has been completed. Its cells neither take any sap up from the roots, or return any to build up new wood. The only channel either up or down for the sap is through the white or, as it is sometimes called, the "sap wood," and the seive-like cellular tissue of the inner bark, which connects the outer bark with the wood of the tree. If we examine with a glass a cross section of a plant or tree, we shall find it made up of two kinds of tissue—one *cellular*, and the other *vascular*. The "cellular" is made up of a great number of very small cells, lying lengthwise, and generally "breaking joints" where they are joined together. The "vascular" consists of long vein-like tubes, which run along these cells. *They* are also cellular; but instead of having a length of not more than three or four times their diameters, as in the cellular, their length is many hundred or thousand times their diameters. These two portions of the plant tissue generally carry different juices—the first that which contains the sugar, starch, oil, etc., which is of an acid nature; and the latter the albuminous fluid which is alkaline. These two fluids are sometimes mixed, and more or less interchanged in their channels.

When a cutting from most of our common trees is girdled, and placed in moderately warm water to about an inch above the wound, a protuberance will soon form around the upper line of girdling, from which rootlets will shoot out. If a bearing grape vine is girdled, near its junction with the older wood, the result will be an increase in the size of the fruit which grows above the point girdled. The same result appears to have followed the girdling of the fruit trees in Michigan, noticed in another column. The efforts of nature to heal a wound of this kind are chiefly from above; but the healing or growing process also goes on, though slower, below the girdling, showing that while the chief wood-producing principle is brought down to the wound by the inner bark, a portion also finds its way below the wound through the wood cells, as already noticed. Although nearly all the organic substances that go to increase the growth of wood, find their way downward, from the leaves, that is no evidence of a flow of *sap* in that direction. Those organic substances move in the direction indicated rather by diffusion, and that in every direction, though mainly by the inner bark, as in most plants, that is, the locality where those substances are mostly needed. If there was a downward flow of sap in an uninjured tree, there would be a necessity for a discharge from the roots, a phenomena which does not exist. Evidence has also been adduced to show that there is an upward flow of sap through the inner bark, as well as through the wood cells.

The summing up of the whole matter shows that neither the flow of sap nor the movements of the elaborated organic matters which go to increase the growth are absolutely confined to any particular channels, but that they move in any direction. The fact that they are chiefly confined to particular channels in particular growths is merely dependent upon the structure of such growths, the arrangement of their tissues, the sources of nutriment, and other accidental conditions.

Important Guano Discovery. — An important phosphatic deposit has recently been found near St. Petersburg, on the Southern Coast of the Gulf of Finland, in Russia. It is probably similar to that recently found near Charleston, S. C.; but of much less extent. It was discovered by some laborers while draining a piece of low land, at a depth of about six feet from the surface. It is situated in the midst of an agricultural district, where mineral manures are much needed.

Such discoveries will no doubt become very frequent and quite general in many parts of the world, now that their value and possible existence is beginning to be known. They are similar in character, and no doubt have the same origin as the ordinary guano deposits found above the surface, and still in process of accumulation.

Beet-Root Sugar.—The production and consumption of beet-root sugar is steadily increasing in Continental Europe. The product of the German, Austrian, Russian and Belgian manufactures for the first half of 1869 was 680,847 tons—an increase of 123,583 tons over the first half of the previous year. This estimate does not include the product of France, which is very near or quite equal to all the rest of Europe. We have heard nothing of late with regard to the progress or prospects of the proposed beet-sugar manufactory in Sacramento.

Japan Chestnut Trees.—A shipment of 5,000 of these valuable trees was received at this port a short time since, which are selling at $25 per hundred. This is the second large shipment of these useful trees. California will soon be stocked with the finest chestnut trees in the world.

Girdled Fruit Trees Bearing Fruit.

Our readers have heard of the great atrocity of girdling some 1,500 fruit trees, near St. Joseph, Michigan, last spring, and how the neighborhood turned out in a body and bandaged them up so as to save them. It will also be recollected that a second, but lesser raid, was met in a similar manner. And now for the sequel. It will be interesting and gratifying to our readers to learn that every one of these trees is living, and that Mr. Green, the owner, has realized an immense crop of fruit from them the past season. This fact is considered quite marvelous by the residents roundabout. Those wise in such matters explain it by saying that the interception of sap by girdling has caused the production of fruit instead of wood, this season, and that the real trial, for the life of the trees, will come next year.

It used to be thought that there was no help for a girdled tree; but that theory is now quite exploded. In the above case the damage was remedied by bandaging the trees with strips of cloth dipped in wax. If the girdling was very broad, we apprehend that a large portion of these trees have borne fruit for the last time. A better way of saving girdled trees, we apprehend, is the following, which has been very successfully practiced for some twenty years, in Nashua, N. H. Mr. Lemuel Town, we believe, was the first to act upon and suggest to others the idea. His method is to graft five or six scions as large round as a goose quill and long enough to reach over the girdled place into the tree. The live bark is first notched above and below the girdle, the sprouts sprung into place and the ends fastened with wax. These scions grow rapidly and in time spread over the whole girdled surface. Apple trees completely girdled, and having the bark taken off over a foot in width on one side, have been saved in the above manner by Mr. Town.

Medicine for Fruit Stealers.—We have heard of various remedies to prevent fruit stealing—such as the throwing of stones, shooting salt and small shot, setting variously devised man-traps, legal and moral suasion, etc.; but the *Rural American* seems to have gone to the root of the matter, and made a suggestion which we think is more to the point than anything we have before heard of. The *Rural* thinks that fruit stealing is a disease, and should be treated medically. The prescription proposed is as follows: Take one ounce tartar-emetic and dissolve in hot water. To be sure that it is administered in the right direction and at the right time, choose some of the ripest and most tempting fruit—such as and where the sufferer will be most likely to find it; carefully dip the fruit in the liquid. The first effect will be a noticeable quamishness, and the second a disposition to abstinence from fruit-eating away from home, resulting in a complete cure of that species of kleptomania. The application is free from danger to the afflicted and often results in much quiet amusement to the lookers-on, and best of all it is singularly efficacious.

The Fall Rains have set in at a most seasonable time, and in so gentle a manner as to just meet the wants of the farming community. The intervals of time between are also highly favorable for farming operations. Most of the land is in a good condition for plowing and the hills are everywhere green from the effects of the warm and gentle moisture. All signs point to a most prosperous winter. The young grain on the summer fallow is up and looking exceedingly well and promising. There never was a time when farmers were more hopeful, notwithstanding the prices of grain is very much depressed.

In breeding to improve stock, it is of the first importance that the male should be of superior pedigree.

The Steam Plow.

From the back windows of our sanctum we look out upon the smoke of the steam plow as it courses back and forth over the adobe flats, cutting its twelve-foot swath, tearing up the annis and soap roots, and leaving them free from dirt to wither and die in the sun, plowing at times two acres per hour, and giving the tough, dry, sun-baked adobe such a cutting and turning, raking and stirring, mixing and whirling, airing and pulverizing, as it never got before, and this, too, with a plow not intended for anything like such heavy work. The adobe has at last found its master, and the advent of the steam plow will probably double the value of this class of lands. This plow has taken two gold medals at the Mechanics' Fair in San Francisco, valued at $200 each, and a prize of $300 from the State Agricultural Society. An acknowledged success in ordinary soil, it was doubted if it would work in adobe. The doubt is now exploded. The present plow does much better than Mr. Standish has claimed for it. He did not expect to work in this land at all, for want of sufficient power and strength, but set it going for the express purpose of getting the data necessary for the construction of a plow especially adapted to this stubborn soil. But strengthening some of its weaker parts, it does its work in such a manner, that he has been urged to stay and put in several hundred acres; and will probably do so, though he is receiving applications to plow thousands of acres of lighter soil in the San Joaquin Valley, from farmers who have seen the working of the plow. The grain is, in some instances, plowed in, no harrowing being necessary, the plow leaving the surface level and smooth. We understand that two or three of our adobe farmers are talking of uniting in the purchase of a plow to be expressly constructed for this kind of soil.—*Petaluma Journal, Nov. 8th.*

Wooden Shoes for Horses.—An ingenious farmer in Granfield, Wisconsin, Mr. Henry Luehring, has adopted the plan of strapping large wooden shoes to his horses' feet when he drives them upon his meadow land, which is very wet and soft; he also uses wheel tires five inches wide, on the same account. By this means he is enabled to haul from or upon his fields double the weight he could with ordinary shoes and tires. The horses, it is said, manifest no dislike to their novel foot-gear.

The Tide in the Bay of Fundy.—Most of our readers have heard of the wonderful tides in the Bay of Fundy, and they will be interested in the following account of them by a scientific observer: Late one day in August, my companion and myself were seated on the grassy, elevated banks of the river, about 80 feet or so above its bed, which was almost dry, and extended for nine miles below like a sandy wilderness. Many vessels lay dry on the high banks, taking in their cargo of gypsum. We thought the appearance very singular, but were too late to watch the tide that evening. Next morning we resumed our station, and soon perceived the water flowing toward us, and rising with a rapidity of which we had previously seen no example. We planted along the deep declivity of the bank a number of sticks, each three feet long, the base on one being placed on a level with the top of that below it, and when about half flow the tide reached their tops, one after another rising three feet in ten minutes, or eighteen in the hour, and at high water the surface was 65 feet above the bed of the river. On looking for the vessels which we had seen the previous evening, we were told that most of them had gone with the night tide.

Death of a Californian Inventor.—Mr. Tustin, of Petaluma, who was killed by the recent accident on the Union Pacific Railroad, Wasatch, was the inventor of the Union reaper, the Tustin Gang-plow, and several other valuable inventions. Mr. T. went East as one of the California Pioneers.

The Stetefeldt chloridizing roasting furnace at Reno, is reported by the telegraph to be a success, and E. Riotte has left Austin to take charge. The invention is, if truly successful, of great importance and value in solving the problem of cheap roasting.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, November 13, 1869.

Financial.

It is gratifying to note the steadily increasing ease in our local money market. The collection of taxes has about terminated, and there will be no more drain from that cause, imparting an additional sense of relief. We do not believe that at any period during our late stringency coin was really as scarce as was generally reported. By some means confidence had been weakened, and capitalists retired their means from free circulation until it should, in some measure, be restored. The panicky, uncertain, and feverish condition of the New York market; the fears generally entertained that a serious and widespread crash would ensue from the enormous gold gambling operations of Wall street; the dilutoriness with which money sent to move the wheat crop returned to the financial centre; the depreciated values of real estate; the diminished supplies of bullion from the interior; the clamors of Eastern shippers for specie from California consignees; the low prices obtained for our breadstuffs in the markets of consumption; the high prices paid for freights; the silly and suicidal twaddle of the advocates for paper currency, and a variety of other causes operating at the same time, were sufficient to create a sense of alarm among capitalists, and raised up a legion of anxious borrowers, who were endeavoring to fortify themselves against the expected crisis. Under so many adverse influences capital sheltered itself from general observation and use; but that the scarcity was not really so great as it appeared, may be inferred from the fact that at the period of greatest complaint a million and a half was readily collected for taxes, and the payments made in the custom-house for duties were heavier in September and October than in any other month of the year, with the single exception of July. The duties paid in the three months named were as follows: July, $942,814; September, $887,824; October, $830,258. It will be seen that while the complaint was loudest, our merchants paid, without difficulty, no less than $1,718,682 for entries in two months, and that too while the million and a half were being withdrawn for taxes. Right upon the heel of these heavy drafts relief is suddenly experienced! How could the seeming anomaly occur, if the reported scarcity were real? Whence have we drawn such comparatively abundant supplies, while over three millions are locked up in customs and taxes? We have also managed to ship $2,044,642 to China and Japan, and $5,860,514 to other places, since the first of September; making a grand total of over $10,000,000 withdrawn from circulation at the very period of greatest apparent scarcity, and yet, without visible receipts of great extent, we find increased ease and more liberal accommodation. In our opinion, the difficulty was caused more by lack of confidence than lack of means.

We quote bullion in fair supply. Gold bars range from 860@870; silver bars, from par to ¼ per cent. off; currency bills on Atlantic cities pay 25 per cent. premium on gold; sight coin drafts, 1@1¼ per cent. premium; telegraphic transfers, 1⅝@1¾ per cent. premium; sterling exchange, 48¾d.; commercial exchange, 49¼@49½; gold in New York, November 11th, 126⅞; Legal Tenders in San Francisco, 78⅜@79.

The duties paid at the Custom House in this city from November 5th to date have been as follows:

November 5	$31,502 97
November 6	36,639 48
November 8	11,557 89
November 9	18,970 27
November 10	20,822 95
Previously in November	97,425 42
In November to date	$216,918 98
In October	830,257 95
In September	887,823 95
In August	769,589 56
In July	942,814 71
In June	675,031 51
In May	595,039 24
In April	554,882 05
In March	780,447 40
In February	602,540 00
In January	532,997 97
Total since January 1st, 1869	$7,388,154 62
Corresponding period, 1868	7,491,564 82
Decrease this year	$106,410 20

The exports of Treasure from Nov. 1st to date have been as follows:

Nov. 4—Per America—		
To China	$1,164,338 85	
To Japan	2,000 00	
		$1,166,338 85
Nov. 1 to 4—Overland to New York		22,000 00
Nov. 5 to 11—Overland to New York		209,815 08
Total since November 1st, 1869		$1,396,193 93
Previously this year		32,531,657 85
Total since January 1st, 1869		$33,927,811 78
Corresponding period, 1868		31,612,418 46
Increase this year		$2,315,393 32

With his customary courtesy, Mr. Bontwell has forwarded to this office a statement of the Public Debt at the close of October last, as compared with its condition in the two preceding months. Here are the figures:

	Sept. 1.	*Oct. 1.*	*Nov. 1.*
Coin debt	$2,107,936,300	$2,107,936,800	$2,107,936,800
Currency debt	64,780,000	64,545,000	61,640,000
Railroad debt	60,860,320	61,180,320	62,188,320
Matured debt	4,648,486	4,522,696	4,389,986
Currency	386,826,713	389,115,942	393,148,760
Gold certificates	23,647,580	24,412,720	28,731,520
Total debt	$2,648,699,399	$2,651,713,478	$2,658,036,326

Following was the condition of the Treasury at the close of October:

	Currency.	*Bonds.*	*Gold.*
September 1	$12,144,487	$37,331,895	$101,214,986
October 1	6,559,004	50,751,121	108,804,658
November 1	7,248,295	64,280,548	116,984,711

Deducting the $25,000,000 due for interest, and the $29,000,000 of gold certificates, leaves a net coin surplus of $62,000,000. All the coupon bonds purchased by the Treasury are immediately converted into registered bonds.

From Europe we have the following advices: Business of all sorts was reported as being very still and quiet in England. The early intelligence that British grain crops would fall short of an average yield, had the effect of sending unusually large supplies to that market, in consequence of which, prices had gradually declined. A reaction was expected when those supplies should fall short by reason of the low prices obtainable. Money was in better demand, more activity prevailing than had been manifested for months previous; but still, the requirement was not equal to the regular autumnal demand. Several important loans were to be placed in market at an early day, the principal ones being for the purchase of the telegraph companies' lines, for the construction of Indian railways, and metropolitan improvements. We are advised by telegraph that the Bank of England has raised its rate one-half per cent., making the minimum 3 per cent.

City Stocks.

The market for miscellaneous securities continues quiet.—Early in the week, San Francisco Gas Company's stock was sold at $87 50 per share.—The Bank of California will disburse its usual monthly dividend of 1 per cent. ($50,000) on and after the 15th inst.—The Omnibus Railroad Company will pay a dividend of ½ per cent. on the 15th.

Mining Share Market.

The mining share market has acquired considerable activity since our previous issue, under a very noticeable improvement in rates, several leading descriptions of stock—Choller, Savage, and Yellow Jacket—participating largely. A more general disposition to invest has manifested itself, and many stocks that have not been called for weeks past were upon the market. The very favorable discovery in the sixth level of the Hale & Norcross mine has also had its influence in contributing to the present strength of the market. The contiguous claims are likely to share in the favorable prospects of the Hale & Norcross. A number of White Pine stocks have also been largely dealt in at improved rates, developments having warranted the advance. The increased reduction facilities in the White Pine region also add greatly to this improved condition of affairs.

HALE & NORCROSS—is in good favor at a smart advance. On the 9th inst. they commenced to cross-cut the vein from the sixth station, at a point fifty feet north of the station, and also at a place sixty-five feet farther north. During the same day they reached the clay wall in both of these cuts, and before nightfall were several feet in the ore of the vein, in both places. The ore is reported to be of excellent quality and equal to any found on the fifth level. Later news states that they had penetrated the ore some fifteen or eighteen feet, showing that the deposit is undoubtedly quite large. The hullion returns for the month of October foot up $110,116, against $80,907 in September.

SAVAGE—was in the market to a large extent, showing a very considerable improvement. This advance may be placed to the credit of the Hale & Norcross mine, since it is quite probable that the Savage mine, from its position, will reap some of the advantages now so favorable to the Hale & Norcross. The bullion receipts during the month of October aggregate $31,271, against $41,800 in September.

CHOLLAR-POTOSI—was in large request under improved prices. For the week closing with the fifth instant, 845 tons of ore were extracted; previous week, 1,063. The different ore-producing localities show little change in their general appearance since our last issue. At the fourth floor above the Potosi tunnel level the ore runs largely to gold. A dividend of $1 per share is payable since the 10th inst. Bullion returns for October aggregate $108,070, against $116,667 in September.

GOULD & CURRY—was in moderate request. During the week ending November 8th they extracted 323 tons of ore. At the seventh station, the drift running southeast is 190 feet in length, the material in the face being porphyry and clay, with a considerable flow of water. The north drift is in 120 feet, showing porphyry, mixed with small seams of quartz. The amount of bullion extracted during the month of October is $28,933, against $44,344 in September.

IMPERIAL—was in the market to a larger extent than last week, selling at better prices.—These remarks also apply to CROWN POINT. Assessment of $7 50 has been rescinded, and another of a like amount was levied on the 5th inst.—SIERRA NEVADA shows a bullion product of $16,100 for the month of October, against $12,666 in September. A dividend of 50 cents per share will be paid on the 16th inst.—EMPIRE had more buyers than for some time past, at an advance. Bullion receipts for October foot up $7,523.—KENTUCK will hold its annual meeting on the 24th inst.—GOLD HILL QUARTZ yielded $2,622 in bullion during the month of October.

AMADOR (Cal.) produced $54,603 in bullion during the month of October, against $49,542 in September. A dividend of $6 per share is payable since the 8th inst.—EUREKA (Cal.) disbursed a dividend of $7 50 per share on the 8th, aggregating $30,000.

RISING STAR (Idaho) levied an assessment of fifty cents per share on the 5th inst.—IDA ELMORE shows a bullion return of $31,205 for the month of October. Dividend No. 3 of $1 is payable since the 10th.

In White Pine stocks the business has been very fair, at improved rates.—CHLORIDE FLAT levied an assessment of $5 per share.—ORIGINAL HIDDEN TREASURE will hold a stockholders' meeting on the 11th day of December, for the purpose of considering the increase of the capital stock from $1,600,000 to $2,133,300 dividend into 21,333 shares of $100 each. The ore breasts of the south shaft show a decided improvement in the bottom, while the north shaft is yielding the usual amount of high grade ore. The suit between this company and the Rathburn has been settled by consolidation; a new issue of stock to be had, and the Rathburn stockholders taken in—one to three.—THE AURORA CONSOLIDATED Company has excavated a chamber in the Earl, which runs northerly from the shaft 50 feet, is 30 feet high and 30 feet wide, and south of the shaft the same chamber extends 50 feet, is 25 wide and 10 in height—and still no country rock has been found, while the ore is very rich, and all the waste taken from this vast chamber would not fill a single wagon-bed. A dike-fissure of about the same proportions and characteristics has been developed in the Aurora Consolidated proper.

San Francisco Metal Market

PRICES FOR INVOICES.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

FRIDAY, November 12, 1869.

New Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. ANN FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR THE WEEK ENDING NOVEMBER 2d.

DOOR BUTT AND MARINE HINGE.—Charles H. Foster, Sau Francisco.

CARPET-BEATING MACHINE.—Loran Mincr, San Francisco.

UNITING ARTIFICIAL TEETH ON RUBBER BASES TO METALLIC PLATES.—E. K. Jenner, Healdsburg, Cal.

HORSE, HAY AND GRAIN FORKS.—E. W. Walton and A. J. Brown, Stockton, Cal.

SHAMPOOING APPARATUS.—Mark L. Winn, San Francisco.

BALE TIES LOCK.—J. Wheelock, San Francisco.

COPY-HOLDER FOR PRINTERS.—John S. Butler, Silver City, Idaho Territory.

GANG PLOW CULTIVATOR.—Henry P. McCleave, Tomales, Marin County, Cal.

POTATO DIGGER.—Yocom, Walker & Sharp, Arcata, Humboldt County, Cal.

CAR BRAKE.—Yocom & Cowan, Arcata, Humboldt County, Cal.

Refractory Ore from Meadow Valley.

Three tons of $2,000 to $6,000 ore from the Pioche mine, in Meadow Valley, Southern Nevada, somewhere near the Colorado river, has been brought to this city for metallurgical tests on a working scale, one batch to be smelted by Mr. Taylor at his metallurgical works near the City Gardens; another to be submitted to roasting and amalgamation by Varney on Third street; and a third batch to be tried in a modified amalgamation process by Mr. Nolf. To one of the parties interested—Mr. Wollcb—we are indebted for a specimen. It is an uurecognizable compound, mineralllogically, made up apparently of the sulphurets of silver, lead, and antimony; probably in large part of one of the dark antimonial sulphurets of silver. The color is iron grey; hardness of small surfaces—that of stephanite. There is a brick-colored oxide (of lead?) and quartz gangue.

The Superintendent of this mine is Mr. Hoffman, who has already erected smelting works—a cupola, furnace, etc.—the first bars from which are expected to arrive in this city in a few weeks.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Imperial Quarries.—We learn by letter that this tunnel was in 1,242 feet on Saturday, October 30th;—the month's progress being 79 feet.

Leviathan.—*Miner*, 30th: Prof. Rickard came up this week; with him a practical English copper smelter. The furnaces and machinery are on the way between Reno and this place, and will soon be erected.

High Grade Ore.—A sample from the Monitor C. M. Co's tunnel No. 3, running in upon the south continuation of the Tarshish ore deposit, was sent to Sacramento a few days since, and assays resulted as follows: Gold, per ton, $75.24; silver, per ton, $926.79; total value, per ton, $1,002.03.

Assessments have been levied upon the Manchester Co., and the Chicago & Detroit Consolidated. The claims are half a mile below town and opposite the Tarshish deposit.

AMADOR COUNTY.

Wolverine.—*Ledger*, Nov. 6th: This mine, the first north of the Eureka, at Sutter Creek, is now being worked successfully. They have a vein of rock, two feet wide, which is rich.

Coney.—We learn that arrangements are making whereby work will soon be commenced at the Coney mine.

CALAVERAS COUNTY.

Palomo.—*Chronicle*, 6th: There was exhibited in town on Wednesday, from this mine, some of the richest rock it has ever been our fortune to look upon. Some pieces are gold with a little rock clinging to them; one of the largest weighed 25 ounces. The rock was taken from the 200-foot level, 250 feet from the shaft. The vein at this point is 10 feet in width. The shaft has attained the depth of 250 ft. from the surface.

Alexander & Co.—The mill is kept in constant operation, with good rock. The new hoisting works are in operation, and are considered model in efficiency and workmanship.

West Point.—Cor. of same: "Mining in this district is confined entirely to quartz. Among the promiuent leads now being worked, is the Zacetara, owned by a San Francisco company. This vein has been worked for years, always paying largely. Adjoining is the claim of Doyle & Morse, who are now working their first crushing; it is said to be rich. (We have since learned that it paid $70 per ton.—*Ed. Chronicle.)* On the road from this mine to West Point is located the claim of Trainor & Co. This is an excellent claim, and they are at present taking out rich rock. To the south of this is the claim of Black & Allstein, a large vein, and rich rock. The Fisher & Schmidt mill is being reconstructed. Mr. Thoss, the celebrated sulphuret worker, has purchased an interest in the property, and is building in accordance with his views of working rock. The machinery is to consist of a crusher of the alligator pattern, with rollers for subsequent reduction and one of Thoss' arastras for amalgamation, The mill will be completed by the first of December. In Sandy Gulch, one mile above, mining at present is very dull, although Harris' mill is playing a merry tune on $40 rock. This mill has run very steady during the past season on rock brought from long distances, as they have an excellent reputation for close working,

LOS ANGELES COUNTY.

Soledad.—Telegram of 6th: Hamilton, of the Star Eureka mine, reports 140 ozs. of silver as the proceeds of eight days run.

MARIPOSA COUNTY.

Rich Quartz.—*Gazette* 5th: Mr. Cassell, Superintendent of the "Oakes & Reese" mine in Hunter's Valley, has shown us some specimens which we have rarely seen excelled. Mr. C. informs us that they are constantly taking out rock of extraordinary richness, and that the indications are favorable for a long continuance of successful operations.

MONO COUNTY.

Dunderberg.—Correspondent of Stockton *Independent:* The tunnel of this mine, owned by the Wurtemburg Company, extends six hundred feet into the mountain, and at its terminus is two hundred feet in perpendicular height from the surface. This company has been steadily at work for two years, and now think they have reached the casing of the ledge, which is twenty feet wide and has been traced for more than a mile. Before commencing their tunnel the company sunk a shaft on the lode to the depth of 40 feet and the rock yielded at the rate of $52 per ton. * * Since writing the above, I am informed that the tunnel has reached the lode, and the indications are good.

NEVADA COUNTY.

McClellan.—Grass Valley *Union*, Nov. 2d: The incline at this mine is down 127 feet, the ledge being large and bearing metal in great quantity. When the shaft gets down to 150 feet, a drift will be run, and rock taken out for milling.

North Star.—Same of 4th: The new 16-inch pump was started up yesterday, and works beautifully, discharging 16,000 gallons per minute. The North Star will not be troubled with water this winter. The batteries will be at work crushing within four days. While the new pump was being put in place, the whole mill and works were put in the best repair.

Pay Week.—Several of the leading mines of Grass Valley pay off this week, and by Saturday night over $30,000 will be put in circulation. There never was a time in the history of this town when more men were employed and when their pay was more certain than now.

West Eureka.—Same of 7th: This company is putting down an incline on their ledge, west of the Nevada road. At the depth of 20 feet the ledge is showing well in sulphurets, and the encasing walls are becoming clearly defined.

Gold Bricks.—Same of 9th: We saw yesterday at Findley's a brick from the Union Hill mine, which was valued at $6,500, making the clean-up for the month over $11,000. The Idaho sent in two bricks, worth over $9,000, and two or three outside mines, pitched in together, gave a brick worth $2,700.

Good Rock.—The Empire Co., last Saturday, found some of the richest rock which has ever been taken out in Grass Valley District. For some two or three weeks the Empire has been showing well; but on Saturday last the show became magnificent. Specimens which do the eyes good to look at were taken out.

Vigilance.—*Transcript*, 3d: This claim, near Cleaveland's ranch, promises well. They have a 6-foot ledge, and 300 tons of rock out. They are putting up a new mill, in which the power is applied directly to the stamps, each stem being an independent piston. It is thought that the mill will be ready for work in 10 days.

Fidelity.—Same of 4th: The Co. have run their tunnel 162 feet, and have a fine ledge, showing free gold and rich sulphurets. This claim is on the Yuba, above Washington.

North Bloomfield Gravel Mining Co. Same of 5th: The dam of the reservoir at Bowman's will be completed to the 44-foot level in four days. They will then put in a new set of timbers, which will raise the reservoir to 65 feet. This dam is constructed of substantial timbers and hallasted with granite. The company propose to commence next summer below and build one of solid masonry, which work will be completed in five years.

New Bavarian.—This ledge is one mile below Rush creek. We have been shown specimens of rock, which are filled with sulphurets and free gold. Rock which H. Myer took to Sacramento assayed $2,000 to the ton in gold. Peter Kuhn has prospected the ledge 300 feet.

Mill Burned.—Same of 6th: The French quartz mill, owned by Pioche & Co., situated beyond Canada Hill, was totally destroyed by fire on Thursday night. It was undoubtedly the work of an incendiary. The mill had six stamps, a steam engine and turbine wheel. It has not been used for some time. The loss is about $5,000.

Selling Out.—A portion of the personal property belonging to the "monstrous failure," the French sulphuret works at Canada Hill, was sold by the Sheriff yesterday, and the monster cylinder, which cost $1,200 for transportation from San Francisco, will be sold under another judgment to-day. These works cost over $80,000.

PLUMAS COUNTY.

Argentina.—Quincy *National*, Oct. 30th: Heath & Co. have got their flume completed, and have been sluicing for some time. Their claim pays, on an average, an ounce per day to the man. Several other companies are at work in the same neighborhood, and are making good wages.

Mill Creek.—Barker, Bradley & Co. are making 5 or $6 per day to the man. Jack Gleason is opening a claim higher up on Mill Creek.

Clermont Hill.—Siler & Myers have got their timbers, etc., ready, and are driving their tunnel ahead.

Hungarian Hill.—Kelly & Co. have taken out good pay for their summer's work, but have not worked much ground. A new company have made arrangements to work a claim in the vicinity of the old Five Points, near Rock Creek.

Black Hawk.—The miners are not at work at present, but have got their claims in readiness for the approaching water season. A company has been formed to work a quartz lode which crops out near the head of Betsy Gulch.

SISKIYOU COUNTY.

Salmon.—Yreka *Union*, 6th: We learn that the quartz star is in the ascendant. The Black Bear Co. are working rock that pays $40 to the ton; the old Union Mill, now the Klamath, is being overhauled, and enlarged; the present company are satisfied that they have plenty of good rock. Another ledge has been discovered near the Klamath, and Parsons & Co. intend to erect a mill on it. The ledge is three feet thick, well defined, and full of gold. Another recent discovery, on Jackass Gulch, is spoken of as promising finely.

TUOLUMNE COUNTY.

Fairview.—Sonora *Democrat*, Nov. 6th: John Bacon has shown us several chispas taken out of this claim, which is on the Stanislaus River, near Ahby's Ferry. The owners have run a tunnel in the mountains and found gravel. Last week they washed five cart loads, and obtained $160 of coarse gold, the largest piece weighing $45.

Arizona.

From Wickenburg.—Prescott *Miner*, Oct. 23d: Persons lately from our sister town speak in glowing terms of the Vulture mine. Messrs. Hargrave, Hardy and Knott assure us that it is getting bigger and richer. The Vulture Co's mill now consists of 40 stamps, which are kept constantly at work. The other mill was running but five stamps. Rock was getting scarce at the mill, owing to the fact that the Indians stole mules from Ariola; but as Beach's train had just arrived, the mill will be kept running.

Big Bug.—On Sunday, the Co. purchased a large wagon and 10 mules. Next morning it was loaded with lumber and supplies for the mill, and started, escorted by several miners, who are by this time at work. The mill is running and paying.

Hassayampa.—Scarcely a day passes that a party of prospectors does not pass on their way to Hassayampa. The present is a good time to go to the bed-rock in the creeks and gulches. Lynk Creek, Big Bug, the Hassayampa, Black Cañon, and their tributaries, all contain gold.

Colorado.

Consolidated Gregory.—*Herald*, Oct. 20th: Work is progressing favorably. About four cords of ore is raised to the surface every 24 hours. The solid iron ore is saved for Hill's works. The mine is 420 feet deep, and most of the work is being done in the east end.

Coaley.—The lode seems to increase in richness as work progresses. The ore last week yielded from 25 to 30 ounces more of silver than any time previous.

More Silver Discovered.—In Grand Island District, George Lytle and William Martin made a discovery four weeks ago which has been worked for silver ever since, with first rate results. It is not named yet. Sixteen tons have been sold to Prof. Hill for $930. The whole ore vein, four feet wide, was taken without sorting. It took two men eight days to take the ore out.

Empire.—Mining is rather brisk. The Peck mill, 12 stamps, is crushing surface ore. On the discovery of the Conqueror lode they have reached a depth of 285 feet. Don C. Daily and R. W. Taylor are working the National, a new lode recently discovered. The crevice is wide and the quartz looks well, David Ball has started the Tennessee mill on National ore. Dr. Munson is repairing the Knickerbocker mill. He will run 12 stamps, and has rented eight to Dr. Roe, of Syracuse, New York, who proposes to introduce a lightning process. He says his process has been tested in California and in Canada, and has proved entirely successful. His machinery will be on the ground in a day or two.

Brigg's Mill.—This has been recently refitted throughout, and may now be considered a model mill. 25 new stamps are at work. The old stamps, 800 lbs., have been replaced with new ones, which are called 500 lbs.

Gold Dirt.—Boulder *News*, Nov. 2d: Capt. Austin informs us that he is operating on surface ores from the Austin lode. He employs six hands, and proposes working four more soon. He will work his ores next spring in the 50-stamp mill at Rollinsville.

Alph. Wright, of Boulder, saw a Mr. Beaver at Central recently wash $23 in gold from a single pan of dirt out of the Ben. Holliday lode.

Items.—Central City *Register*, Oct. 28th: We were shown yesterday by Alexander Cameron an assay of ore from Chicago Creek, which gave $495.82, coin....Albert Johnson is sinking on the Major Anderson lode, Georgetown. In going down 25 feet he took out 10 tons of ore, that yielded by amalgamation $121 per ton, silver....Mr. Bradley is tearing out the portable engine in his mill in Russell's Gulch, and is putting in a stationary one....Four bars of silver bullion, worth $10,000, passed through town yesterday, en route for the East by express. They are from the Georgetown Smelting Works....The present storm will put an end to gulch mining in Colorado for this season.

Lake County.—A couple of men have discovered a lode at the head of California Gulch, with a dirt crevice, from which they are taking out 50 ozs. of gold per week by buddling. Prospects from this discovery have panned as high as $125. Gulch mining stopped about the 1st, for lack of water, which froze up. The Five-Twenty lode is paying largely.

Conqueror.—Georgetown *Miner*, Oct. 28th: Jerry Haskins, one of the owners of the Conqueror mine at Empire, informe us that on Friday they got through the "cap," and now have a fine body of solid iron. The shaft is 290 feet in depth.

Bricks.—L. Huepedeu & Co. have shipped, since our last issue, three bricks of silver, two from Equator ore, one weighing 1,500.20 ozs., .795 fine, coin value $1,542.06, and the other 1.575 ozs., .837 fine, coin value $1,704.46, being of greater value than any one brick ever before produced here by amalgamation. The third one was from Cascade ore, and weighed 190.90 ozs., .937 fine, coin value $231.28. The total number of ounces is 3,266.10, coin value $3,477.80.

Baker Co.—Monday we saw a button of silver bullion, belonging to the Baker Co., refined at the Baker Co's works, weighing 1,815.08 troy ozs., coin value $2,178.09.

Equator.—The main shaft is now 265 feet in depth, and just coming into a fine body of ore. The engine, boiler and hoisting machinery for shaft No. 3, east, is soon expected.

The Brown Co. shipped, on Monday last, 517 lbs. troy, or 6,204 ozs., of silver bullion; coin value, $8,375.40; currency value, $10,888.02.

Park County.—Ypsilanti lode, Hall Gulch, shows in the cut a 12-foot fissure vein. Assays from this and several other lodes show well; the Madagascar as high as $400 to the ton.

Tunnel Enterprises.—This is the true method of mining in Clear Creek county, and it has fairly been inaugurated. Work is being vigorously prosecuted on no less than six tunnels. Dr. Kane, of Ohio, has organized the Helmick Tunnel Co., for the purpose of developing the great belt of silver-bearing lodes on Leavenworth Mountain. The depth from the surface to the floor of the tunnel is 1,240 feet, and its whole length 4,000 feet. Some 15 lodes will be cut on the north face of the mountain, and on the south as many as 18.

Idaho.

Flint.—*Avalanche*, Oct. 30th: This district continues dull, but some prospecting is being done, and we are firm in the belief that good mines will yet be developed. Fred. Warnkee has just returned from Chicago, in company with a gentleman who has come as the representative of some capitalists.

Keystone—First South.—This mine, in Long Gulch, has been prospected by a shaft seven feet deep. Several veins have been developed, which show rich rock. Messrs. Purdy, Sayres, and Hosea Eastman, the principal owners, intend to prosecute its development.

Mines.—We visited the Ida Elmore and Golden Chariot a few days ago. The above ground works of both these mine are in splendid working order, and everything looked lively.

Water Ditch.—The water ditch owned by Purdy, Angell, Stevens, Miles and others, is to be completed in about a week. It runs from the head of Long Gulch to the placer claime in Black Rock Gulch, on Florida Mountain. It will be, when completed, three miles long, two and a half feet at the bottom, and 14 inches deep at the lower side, with a grade of one-half inch to the rod. Capt. Tedford and others are running a ditch to the same placers, from the head of Jordan Creek.

Loon Creek.—Oro Grande cor. of *Statesman*, Oct. 30th: Our camp is getting dull. At a meeting last week, called for

the purpose of laying over claims, the committee which was appointed reported resolutions, requiring all bona-fide claim holders to come forward before the Recordor and have their claims filed within six days. But they were voted down, and a motion adopted by which all the ground in the district was laid over just as it stood on the record. Thus there is no chance for an outsider to possess himself of a mining claim unless he buys, and that at high figures. This action will be the means of retarding development of this part of Idaho.

Yellow Jacket is likely to prove worth something after all. A very rich quartz ledge, gold-bearing, is reported to have been discovered.

Reports are in circulation that a new discovery has been made within a distance of 10 or 15 miles of Ore Grande, and the evidences are such as to lead me to believe the truth thereof.

Nevada.

COPE DISTRICT.

MORE ORE.—Elko *Independent*, Nov. 3d: Eighteen hundred pounds of ore, from the Monntain City mine, was shipped to San Francisco yesterday. This lot is said to be a fair average, and was selected for a working test. Six tons from the Argenta reached this place on Monday for shipment.

MOUNTAIN CITY.—Cor. of same: The machinery for the Drew & Atchison mill has arrived in perfect order. The boiler and engine are in position; the building is covered in; all the lumber is on the ground; and every thing looks better than the most sanguine had anticipated. Uncle John Atchison informs me that in order to have all the machinery in perfect order he will not start up before the 1st of December. Messrs. Delbanco & Buneman, have shipped during the past 10 days, 14 tons of Argenta rock; of Hamilton, 2¼ tons; Belle of the West, 5 tons. Thos. Lynch has shipped 4 tons of selected rock from various ledges; making in all 25¼ tons. The Eudora, on Argenta Hill, have run a tunnel 53 feet already, and intend running it 1,200 this winter if possible. There is every indication of striking it very rich. The Argenta Company are taking out an average of three tons per day. As they go down, the ledge is getting wider and the rock is richer than heretofore. The Hamilton is improving greatly.

NEW DISCOVERY.—Same of 6th: Fred Hafford has shown us some ore from the Rainbow ledge, in Railroad district, that is astonishingly rich in bromide of silver. Several pieces were burned in a blacksmith's forge and became perfectly coated with silver. The ledge is said to be quite large.

NEW MILL.—Wm. S. Canty has returned from San Francisco, where he has been arranging for a mill, which will arrive in a few days.

BALD MOUNTAIN.—Advices are encouraging. John Foreman is taking out ore for shipment. Dr. Bailey is reported to have made two valuable discoveries within the last three weeks. One is an antimonial silver vein, of three feet in width, and the other a galena ledge, containing silver in paying quantities on the croppings. Wood is said to abound, and smelting furnaces can be erected with but little cost.

ESMERALDA.

WALKER RIVER.—Gold Hill *News*, Nov. 3d: Garrard's smelting works, half way between Fort Churchill and Pine Grove, are a perfect success, smelting at the rate of seven or eight tons of ore per day. It yields 20 per cent. of copper with $6 of silver to the ton. The mine has been worked to the depth of 100 feet, and the ledge averages six feet in width.

HUMBOLDT.

UNIONVILLE.—Cor. of *Independent*, Nov. 3d: I made a visit to the Arizona lode this week. Starting in on the main level, the first 250 feet is in the tunnel of Jno. C. Fall, at the south end of which we reach the Silver mining ground. The course of the ledge from this point is south, and the Silver has followed it 250 feet, taking out the ledge as they progressed, which will average the whole distance not less than seven feet in thickness, not a pound of which but will pay for working. The ore is sorted and the best sent to England. Mr. Steward shipped 30 tons this month, most of which was worth $800 per ton, while his mill is kept constantly at work on lower grades. The Silver Mining cleared in the month of September $12,000 over and above expenses, which paid off all the debts of the company, and this month will clear about $15,000, which will yield a dividend of about $12 per foot, The yield of Fall's mine is about the same. The developments of the Arizona have had a wonderful effect in stimulating others to persevere and have started an army of active prospectors over the mountains. The De Soto Company, in Star district, has levied an assessment of $2 a share, and intends going to work with renewed vigor in the spring. Gen. Weaver and Geo. Lovelock have made a famous discovery on the summit of the mountain. The ore is of a dark brown color, considerably decomposed. Several tests have been made by working process, yielding from $35 to $60 per ton. The lode is said to be 20 feet in width, cropping out for a long distance on the surface of the ground.

OREANA.—*Independent*, 6th: Mr. Davis, the Supt. of the Utica mill, has furnished it with all the latest improvements, and is now prepared for custom work on a large scale.

Oreana is again looking up. Several new companies are at work in the district. The Savannah and Galena ledges are turning out handsomely. The ore taken out is being shipped to San Francisco, and yields a good profit. The furnaces, which are the most extensive in the State, are idle, but there is a prospect that work will be resumed.

The Alpha mine, a few miles above Oreana, is regarded as a "big thing." It is owned by an English company, who have extensive reduction works at Reno, and are shipping large quantities of ore. An advance of $500 per ton is obtained for first class ore from shipping houses in San Francisco. The mine at present is yielding 10 tons of ore per day, about equally divided between first and second class ore.

G. W. Carmany & Co. are opening the first extension south, with flattering prospects. Work is being done on several other claims along the Alpha belt.

RAILROAD DISTRICT.—The Humboldt vein is a large one of gray copper ore, which assays in silver $40 to $70 per ton, and yields 40 per cent. of copper. A telegram of the 5th reports the Nevada mine as sold. The purchasers will ship ore to England.

PAHRANAGAT.

HIKO.—Cor. of *Reveille*, 6th: The Illinois and Indiana mines are both on the great Hiko lode. The thickness of the vein longitudinally, a distance of 10,000 feet, will average 20 feet. The company own 26,000 feet. The vein throws out spurs that in other districts would be called mines; many of them have large masses of high grade ores easily extracted.

A large quantity of ore is being taken from the mines, of which we are working about 12 tons daily, averaging $100 per ton. The whole vein matter would average from $50 to $70 per ton, and can be worked by wet process, arrangements for which are being made. The mill is at Hiko, 12 miles from the mines, and has a capacity of 10 stamps, five furnaces and eight pans. An artesian well is under construction at the end of the tramway, 1,500 feet from the main workings, where reduction works will be erected.

REESE RIVER.

ANOTHER MINE OPENED.—*Reveille*, Nov. 1st: The Isabella mine on Lander Hill, which has been closed for a long time, was opened on Saturday by a party that will work it under a lease. In the early days the Isabella produced remarkable rich chloride ore.

TO BE DEEPENED.—We understand a contract is to be let to sink the shaft of the Lane and Fuller Co. 50 feet.

TROJAN.—The shaft is to be sunk 100 ft. at $10 per foot, the mine to furnish the timbers, hoisting power, materials and tools. It will be observed that the contract price is extremely low, which may be put down to the score of single-handed drilling and giant powder.

BULLION FOR THE QUARTER.—The product of Lauder county for the quarter ending Sept. 30th, was 1,762 tons 973 pounds. The value amounts to $253,197.60, which is an average of $139.21 per ton.

WORKS COMPLETED.—Same of 4th: The hoisting works of the Toiyabe Co., on Lander Hill, were set in motion on Monday. They are estimated to be powerful enough to sink the shaft of the company 1,000 feet, unless the volume of water should largely increase.

WASHINGTON DISTRICT.—We heard this morning that an important strike of good ore had been made in the mines of the Utica and Herkimer Co.

MANHATTAN.—Same of 5th: The mill of the company will be opened for work next Monday. Its repairs will be complete and thorough.

MINERAL HILL.—*Enterprise*, 4th: Charley McWilliams has returned from Mineral Hill. He says the mines are the richest he has seen in the country. The Mineral Hill, the principal lead, is nearly 50 feet in width, and yields ore which by mill process pays from $300 to $1,000 per ton. There are many promising leads. The present population of the district is about 250. The deepest shaft is not down over 30 feet, but as depth is attained the leads show increase of metal. There is plenty of wood and water—wood selling at $4 per cord.

WASHOE.

SIERRA NEVADA.—Gold Hill *News*, Nov. 6th: The winze below the car track level is completed to the depth of 100 feet, and a drift from the bottom commenced, which will cut that rich lodge of white ore 50 feet deeper. The drift above continues to look well.

IMPERIAL-EMPIRE.—The shaft is 1,160 feet. Drifting south at the 1,080-foot level, towards the Holmes ground, resumed last Monday. The drift is 156 feet in length from the shaft, and has about 105 feet yet to run. The old upper workings are yielding 45 or 50 tons per day.

OPHIR.—Nothing new in the lower drifts, except water, of which a rush during the last forty-eight hours has drowned out all mining. Notwithstanding all efforts the water has raised in the shafts to the height of 300 feet. The prospect of progress in either of the drifts, during the next six weeks, is not good.

YELLOW JACKET.—The mine is yielding 165 tons per day, principally from the 900-foot level of the north mine. The connection between the 800 and 700-foot levels will probably be completed to-day.

OCCIDENTAL.—The face of the lower tunnel still promises well. The old mine never looked better. A general survey is being made for the first time.

VIRGINIA CONSOLIDATED.—The new shaft is 393 feet deep to-day. They are making over two feet a day; although the rock is considerably harder than it was, it blasts well.

SAVAGE.—Thirty feet above the track floor, in a winze, they have drifted north 15 feet in a body of excellent ore, over 10 feet in width, which will mill $33 per ton.

LADY BRYAN.—The station at the bottom of the shaft, 172 feet from the surface, is completed, and the sinking of the incline commenced. The main south drift at the 80-foot level shows plenty of excellent pay ore in the south end.

HALE & NORCROSS.—Drifting north and south is still progressing at the sixth. The average yield is 150 tons per day.

GOULD & CURRY.—A small stream of water in the south drift, at the 7th level. The old mine is yielding about the same.

CHOLLAR-POTOSI.—Yielding 160 tons of $40 ore per day. The breasts and stopes of the Blue Wing sections are looking a little better.

ALPHA.—The drift north, from the 1,080-foot level of the Imperial, is in 80 feet.

OVERMAN.—Yielding a little less than 100 tons of ore per day.

SUTRO TUNNEL.—*Enterprise*, 7th: The tunnel was in 88 feet last evening—that is, the "leader," which is being driven in advance of the main work. The ground is still a mixture of clay and boulders.

A Virginia telegram of the 9th says: Work has been resumed on the old Monte Christo mine, untouched four or five years.

WHITE PINE.

WEEKLY MINING REVIEW.—*Empire*, 7th: The situation has steadily improved, and our mines are shipping to mill a larger amount of ore than at any time since the discovery of the district. It is true, our bullion shipments are not quite as large as a few months ago, when nothing but first-class ore was worked. When, owing to the scarcity of stamps, miners could get but a few tons of ore milled, they selected it with great care, and as a rule, nothing was shipped that would not yield above $75 per ton. Now, however, we have more mills, the cost of reduction is less than formerly, and but little attention is paid to assorting ore. This of course reduces the general average of the yield, which, for all the mines of the district, will probably not exceed $65 or $70 per ton the present quarter, as against $99.98 per ton for the last. The supply of ore on dump at most of the mills, together with the shipment from the mines during the next month or six weeks, will be abundantly sufficient to keep all of the stamps in constant operation through the winter.

BULLION.—*Empire*: Our bullion shipments for the week amount to $64,119.45 against $53,687.20 last week, an increase of $10,432.25. The largest shipment ever made from the District in a single week occurred in July last, amounting to $76,538.17, or but $12,418.72 more than our shipment for the past week. The *News* of 6th says: Bullion shipments for the week ending yesterday, $51,770.15—an increase of $11,196.43 over the shipment for last week.

MILLS AND FURNACES.—*Empire*: Thirty new stamps have been set in motion during the week—the Dayton 20 stamps, and the Mineral City mill, Robinson District, 10. The little crusher at Patterson, having been provided with stamps, also steamed up anew on Friday. Two additional mills are to be completed before the holidays—the Chicago mill from Elko, and that of Barton & Co., to be built on Treasure Hill. They will carry ten stamps each.

The base metal interest continues to prosper, though a few of the smaller draft furnaces have been out of repair during the week, and in consequence idle. The Nevada Mining and Bullion Company, with a capital stock of $100,000, to operate chiefly in base metal ores and bullion, filed its article of incorporation here the first of the week.

BOREALIS.—*News:* One particularly important strike has been made during the week—that of the Borealis mine. It is important in showing that the large body of rich ore in the Earl is continuous from the Aurora South across the head of Chloride and Bromide Flats, more than 3,000 feet, and renders the theory plausible that the same body continues unbroken to the flat west of the Hidden Treasure mine—about half a mile.

ITEMS.—*News:* Aurora Consolidated yields 80 ton per day....Auburn is taking out good ore from the 60-foot level. Sixty tons on the dumps....Consolidated Chloride Flat mills 62 tons per day....Charles and Theresa sent 40 tons to mill yesterday. Very rich ore was struck on Thursday, and four sacks of horn silver selected from it. ....Doran has been sold in New York, with the Little Treasure mill, for $40,000 ....Eberhardt is working an increased number of men on the Keystone surface ....Ore in Hidden Treasure, south shaft, improves. Suit with Rathburn settled by consolidation....Mammoth has compromised with Republic....Noonday has 100 tons out, and is sending to mill....Pogonip & Othello vein is 67 feet wide....*Empire* says Tom Paine has a magnificent supply of ore in sight....Rip Van Winkle sent eight tons to Mosheimer's smelting works. ....Miners' Dream down 30 feet, and has large lot of ore on dump....Brooks vs. Merced case in District Court still on trial. ....Upton has sold to Chicago parties the Challenge and two other mines for $300,000. Several other sales are mentioned at the figures given.

THE EMERSLEY.—The Pure Metal mine, Hot Creek, which was bonded to J. D. Emersley for $10,000, was sold by him in Chicago, subject to the report of experts to go on immediately. They went; and saw; and paid. The Co. has leased the Old Dominion mill, and expect to roll out bullion in a few days.

OUTSIDE DISTRICTS.—*Empire* gives a list of about 40 districts in Eastern Nevada, and says there is not one which does not show well, all things considered. Silver Park, a new district, 100 miles east of Hamilton, promises to be a rival of Treasure Hill. Some of the ore is scarcely distinguishable from the best Eberhardt. A hundred claims have been taken up.

THE SMALLEST STEAM ENGINE YET.—The Newburyport *Herald* says that W. J. Trafton, who built the little steam engine "Fairy Queen," will, during the winter, complete another, which will be made from a silver half dollar, and with boiler and all complete will be placed under a glass case one inch and an eighth in height by three-quarters of an inch in diameter. The dimensions will be as follows: Diameter of cylinder, 1-16 of an inch; stroke 5-32; diameter of wheel, 5-16; steam pipe, 1-32 (about the size of a common knitting needle). The boiler will have two minute gauges, and will hold about eight drops of water; and it is expected that four drops generated into steam will be sufficient to run it several minutes. The parts being so small will be obliged to be made with a powerful magnifying glass.

ENGLISH MINERS' UNION.—There is a miners' union in Great Britain numbering 60,000 men. Its President, Alexander McDonald, is now, or was recently, in this State, for the purpose of examining into the opportunities it offers for English mining emigrants.

NITRO-GLYCERINE.—An average of 4,000 pounds of nitro-glycerine have been used during each month for the past three years at the Hoosac Tunnel.

San Francisco:
Saturday Morning, Nov. 13, 1869.

Tunneling in Alpine County.

Within a radius of half a mile around Mt. Bullion, Alpine County, there are three great mining undertakings in progress: the Monitor Consolidated, the Imperial Silver Quarries, and the Mt. Bullion Companies' Tunnels. The latter is on the west bank of Carson river, and is designed to cut the Union, Duke of Wellington, Washington, Rosecranz, Eastern Slope, Mt. Bullion, Star of the West, Red, White and Blue, and Highland Mary lodes; the company owning 1,800 feet of water front on the river, and a water-power of twenty-eight foot fall and 3,000 to 4,000 inches at low water. English capital is doing the work. Three shifts of men working by contract accomplish about sixty feet per month. The tunnel is nearly parallel to that of the Imperial Company, and cuts nearly the same lodes, both getting into the remarkable Tarshish ore formation. So much capital invested to open these lodes, by two separate companies, indicates that careful examination has resulted in giving promise of great rewards. The best specimens of silver-glance in this country hail from Alpine County.

WASHINGTON MINING COMPANY, FRENCH GULCH, SHASTA COUNTY.—From Superintendent John Souter we are in receipt of two specimens; one containing auriferous iron pyrites, galena and zinchlende, in quartz; the other, native gold associated with sulphate of baryta, or heavy spar, in quartz bands, that alternate with other black bands composed in a smaller degree of quartz, but in the main of a coal-black mineral, which in hardness, glance, structure, and probably in composition, resembles chlorite, containing also iron pyrites.

THE STANDISH STEAM PLOW.—An interesting notice of the late performance of this plow at Petaluma will be found under the agricultural head of the present issue. We have a sack full of the adobe soil in which it was operated, the lumps of which are so hard that a nail can be driven by them, as with a stone. There is no other plow in the world which could possibly be made to break up such a soil.

DRAWING.—Burgess' System of National Drawing embraces sets Nos. 1, 2, 3 and 4, of six cards each, with brief explanations, costing 40 cents per set. Set five contains eight cards and a pamphlet on perspective drawing, price 50 cents.

Fortieth Parallel Geological Survey.

From J. D. Hague, Esq., one of the members of Mr. King's party, who has been in San Francisco during the past week, we learn that the field work undertaken in behalf of this survey has been entirely completed, and the office work, which is to be carried on at Washington, will be brought to as speedy a completion as the nature of the work will permit; the appropriations made at the last session of Congress being sufficient to defray the necessary expenses, to the complete finishing of everything, including the publication of the three large octavo volumes proposed to contain the results, besides two large atlasses, of a size between that of the *Bulletin* and the Sacramento *Union*.

The first volume to be issued will probably appear early next spring. Owing to the lateness of the date of the appropriation last session, Mr. King was induced to defer publication until the several volumes could be brought under way together, and issued without further interference. The one first issued will be the most important—on Mining—embracing everything from Virginia City, Nevada, to Central City, Colorado, and will be accompanied by a large and fine atlas, very well executed and costly. The second volume to be issued will be on the Geology of the region surveyed, embracing its physical features and resources. The last volume will contain the Botanical and Zoölogical notes, and will also be accompanied by an atlas. Each of the volumes will be liberally illustrated, with a view to making the facts and generalizations presented the more comprehensible, popular, and generally useful to those for whose benefit the survey was intended.

So quiet and evasive of public notice has been the course of all connected with this survey, from its inception, that the circumstance has been the subject of remark. Yet from what we know of the working capacities and of the industry displayed by the gentleman in charge, we are very confident that the results will be highly appreciated. The field has been a splendid one, for the ambition of young men desirous of winning a good name and public favor, no less than for the real economical value of such a pointing out of the resources and features of the important domain in question, now opened up to the nation and to the world by the transcontinental railroad. The survey is in response to a real demand for fundamental facts and knowledge on the subject of our new national industry of mining and reducing the ores of silver in combination with gold. Mr. King's party has had the benefit of all the maps and results of the U. S. Pacific Railroad Exploration and Surveying Expeditions, in which there is an immense amount of information that could be made of practical account in the pursuits of mining; and they are all men practically and scientifically thorough in the several specialties assigned to them in the work. The names of the principal members, so far as we know them, are Messrs. King, the two Hagues, Simmons and Stretch. The survey is a national affair, as the matter is one of national importance. Touching the value of reports of this kind, we are frequently enlightened, by individuals who have no use for them; but amongst all well informed and well-read economists, themselves of the working school, the testimony in their favor is most enthusiastic. If we desire reliable information in regard to the resources, conditions, the physical geography and salient features of any new State, we inquire of the librarian for the Geological Survey; and thus it is the world over.

AN important article to millmen and mine owners generally will be found on our second page, giving facts, methods and figures touching milling and out-bringing in Colorado.

Agricultural Fairs—The Fair at Chico.

One of the most hopeful indications of progress and improvement in the agricultural industry of this coast is the increasing interest manifested in the local district Fairs, which are held every fall, in various sections of the State. It is very seldom that any special effort in improvement is made in any direction, except where something of a spirit of rivalry is introduced. No better plan to effect such a result has ever been devised than the institution of Fairs. It is mainly to these modern devices that the world is indebted for the wonderful progress which has been made, within the last sixty or seventy years, in the various branches of the mechanic arts, manufactures and agriculture. They cost time and money, it is true, and of themselves, directly, produce nothing; yet they are wonderful incentives to industry, enterprise and excellence. No money pays a better interest than that invested in Fairs. They should be encouraged by all classes of citizens, and legislative appropriations may always and with propriety be invoked in their aid.

The demand upon our columns by the late and long continued Mechanics' Fair in this city, has prevented us from doing anything like justice to the various local Fairs which took place during the continuance of the San Francisco Exhibition. We have before us some notes furnished by a correspondent from the Chico Fair, which should have been attended to at an earlier date, and at a time when the existing interest of that Exhibition would have warranted a more full mention of it. This Fair commenced on the 28th of September and closed October 2d. The district of country represented there was the entire Upper Sacramento Valley. The President of the Association is General John Bidwell, who delivered a very interesting and instructive address at the opening. The General takes a great interest in agriculture, and is a very energetic and public-spirited gentleman in all public matters. The Exhibition Hall stands upon a lot of land donated to the Society by him. The Fair was a grand success. The stock grounds were full, and made a fine show. The city was crowded with visitors, from Plumas and the adjoining counties. Many strangers from a distance were also present. In addition to the regular tickets of admission, $3,500 was taken in life memberships at $25 each.

The hall was finely decorated with flags, mottoes, etc. Upon the right were the words, "Arts, Science and Manufactures;" upon the left, "Agriculture, Horticulture and Commerce;" over the speaker's stand was emblazoned "Speed the Plow." There was a fine band of music in attendance, and the "Agricultural Choir" sang some beautiful and appropriate pieces, with great effect.

There was a fine display of fruits, vegetables, cereals, butter, cheese, bread, etc., within the Hall; also of various kinds of handiwork. The Marysville Carriage and Wagon Factory (Hill & Knaugh) made a fine show of their work. Mr. A. S. Warner, the architect and builder of the Hall, exhibited samples of flooring, doors, siding, molding, etc., from his steam mill. The Marysville and Sacramento Woolen Mills each made a full and fine display of their goods. Both of these mills are in a flourishing condition, and turning out most excellent work.

Outside of the Hall there was a fine show of agricultural implements—including Sweet's Patent Gang-Plow, also Hill's and others. Quite a spirited and well-contested plowing match was held, at which Hill's Plow, of Marysville manufacture, took the first premium. The regular Annual Address was delivered by G. Barstow, Esq.

THE Virginia and Truckee Railroad is finished to Gold Hill.

Irruption of Geologists.

Without warning, or mutual understanding, there arrived in San Francisco last week the heads of all the Western Geological surveys that are, or have been in progress recently, viz.: J. D. Whitney of the unfinished California Survey, Clarence King, and J. D. Hague of the Fortieth Parallel or Pacific Railroad Geological Survey, and F. V. Hayden, with his assistants, Messrs. Stevens and Persifor Frazer of the Colorado, Nebraska, New Mexico, and Wyoming Geological Survey. Report hath it that the heads met, quite unexpectedly to each other, somewhere near the corner of Montgomery and California streets, and, though old acquaintances, had not seen each other for so long a time and were so surprised that they did not recognize each other. Hayden is in the United States employ, and has just completed surveys of Colorado, Wyoming and New Mexico with special reference to coal, on which subject his reports and maps will undoubtedly prove highly valuable, and standards for reference. He has left the city for Mount Diablo, for the purpose of examining the coal deposits of that district.

Mr. Whitney has just completed a special survey that occupied some months in Colorado. Since the issuance of the second volume of California Paleontology and the Yosemite Book, he has brought to completion two volumes of Pacific Coast Ornithology uniform in size with the preceding volumes of the survey, and in connection with which an Eastern publishing house proposes to issue a third volume of Eastern Ornithology; so that the whole three volumes when completed will be the standard American work on Ornithology for a long time to come. A few advance sheets of this work which we have seen give token of a work of great value, as well as of superior mechanical and artistic excellence. One of the Pacific coast volumes will embrace all the known land birds, and the other the sea birds, from Alaska to Cape St. Lucas.

The second volume of California Geology which was to contain all the more important results of the Survey, was placed in abeyance by the failure of the Legislature to make an appropriation even for its publication. There is property in the shape of plates, maps, books, specimens etc., left on the hands of Prof. Whitney, remaining thus unavailable to those who would benefit from the results of the survey, amounting to a value of $20,000; while the State owes him for money expended from private resources on behalf of the survey $15,000. Prof. Whitney was cut off, two years ago, with a want of ceremony, and a depreciation in the remarks made regarding his labors by some of the members, entirely unmerited, and as unworthy of the intelligence of the speakers as unjust to Prof. Whitney,—language which would have been very differently pointed, perhaps, had there not been a better reason for stopping the survey than economy or the inefficiency of Prof. Whitney. Now that Whitney's grasp upon the embryo State University is disposed of, and the real opponents of the survey who "killed the appropriation" are safely ensconced in chairs of dignity in the Board of Regents, it is probable—certainly desirable and politic, as well as safe for the University—that so much consideration be at least given to the California Geological Survey as to finish it up, with the attention that the case demands.

PUMPELLY'S NARRATIVE "ACROSS AMERICA AND ASIA."—Leypoldt & Holt announce shortly to appear (royal 8vo, with maps and illustrations) Mr. Pumpelly's notes of a five years' journey round the world in the capacity of geologist and mining engineer, dwelling more especially upon Arizona, Japan and China.

Steamboat Building in San Francisco.

We made a brief allusion, a few weeks since, to the noticeable fact that the Risdon Iron Works, of this city, had, in the brief space of one month, constructed the machinery for no less than five steamers, having an aggregate power of 2,000 horses. A more full mention may not be out of place at this time.

The first of these steamers, the Neptune, was modeled and built by Middlemas & Boole, under the supervision of Mr. James Pollock, for use in towing vessels. She is 115 feet long, 22 feet 6 inches beam, and 9 feet 6 inches depth of hold; two engines, 22-inch cylinder and 24-inch stroke; two boilers with direct tubes four inches in diameter, containing 1,900 feet of heating surface, and capable of supplying steam of 90-pounds pressure with 100 revolutions per minute. The propeller is 9 feet 9 inches diameter, and 16 feet 6 inches pitch, giving a speed of 17 miles per hour, and a very high towing power.

Next came the Vallejo, modeled and built by D. Marcucci, under the superintendence of Mr. James Pollock, for the California Pacific Railroad Company, for the purpose of carrying freight to and from San Francisco to their terminus at Vallejo. Length, 130 feet; beam, 26 feet; depth of hold, 7 feet; built to run in shallow water. She has one engine 28-inch cylinder, 24-inch stroke, with propeller 8 feet diameter and 13 feet pitch. One boiler with 4-inch return tubes; containing 1,500 feet of heating surface, and capable of supplying 70 pounds of steam to 120 revolution of engine. This boat has run her distance of 25 miles, with a fair tide, in one hour and fifty minutes, without being pushed to her utmost; a very fair speed considering her dimensions.

Next in order is the Monterey, built by Messrs. Goodall & Nelson, for the Salinas trade, made purposely to draw little water and carry heavy cargo, and withal strong, to withstand frequent grounding on the shallow bars of the coast ports. Great credit is due her modeler and builder, Mr. Gates, in combining the qualities required, viz: great carrying capacity, strength, lightness and sea-going qualities, under the restrictions of shallow water, crooked channels and rough weather. Her length is 120 feet; breadth of beam, 27 feet 6 inches; depth of hold, 7 feet; draft of water, light. She is fitted up with one engine 24-inch cylinder, 24-inch stroke; upright engine boiler, return tubular, 5-inch tubes. Her heating surface is 1,200 feet, supplying steam of 70 pounds pressure to engines making 95 to 100 revolutions per minute. Speed, 11 miles per hour.

Fourth in order, comes the H. H. Buhne, built by Captain Kentfield, and under his supervision, for the purpose of towing on the bars on the northern coast. The length of this boat is 95 feet; beam, 22 feet 9 inches; depth of hold, 9 feet 6 inches. Engines similar to the cugines of the Neptune; but with return tubular boilers; and having 195 feet of heating surface. She is built in the strongest possible manner, to withstand the heaviest weather that may occur on this, the most stormy port of our coast, and looks as if no sea, however rough, could have any effect upon her. Her propeller and machinery have also been made, with a view to heavy towing in such situations; therefore, speed has been a secondary consideration, though so far, she has shown herself second to none of her class.

We come now to the fifth and last of the series built by the South San Francisco Ferry Company, which proved herself to be, as intended, very fast. This is the more satisfactory, considering that, in her construction, some novel ideas have been carried out.

She was built by John G. North, and engined by the Risdon Iron Works Co., under the superintendence of Capt. Tyler, who learned steamboating on the great Mississippi. The boat is 155 feet long, 25 feet 6 inches beam, 7 feet depth of hold, and of remarkable fine lines. Her saloon occupies the whole length and width of the boat, with state-rooms and smoking room on the upper deck, with pilot house forward of this. The engines are placed well aft, and rest immediately over the side of the boat, being the place of greatest strength, and are fastened through to the bottom of the boat. The boilers—two in number for each engine—are placed on the guards, and are entirely separated, and worked from the outside, so that no dust or noise is experienced in the bottom of the boat. The boilers are of the tubular description, each 48 inches diameter, 12 feet long, with 50 tubes 3 inches diameter, built in fire brick, and fitted with all the modern appliances for safety; are inspected, and allowed 115 pounds of steam. The engines are two, cylinder 22 inches diameter, 5 feet stroke—and are intended to make 40 revolutions with a 21-foot wheel, by this means developing 500-horse power. The engines do not stand, as is usual, in a line with the keel, but at an angle of one inch to the foot—wider forward than aft—while the buckets of the wheel are put on to bring them at right angles with the keel, thereby lessening the shock of the boards on the water; a very necessary precaution, considering the great velocity of the wheel and large amount of slip. Her speed is intended to reach 18 miles per hour; and from that made on her trial trip, there is no doubt but that this can be made.

We have thus briefly described what one of our workshops has done in a short time; and if compared with work of the same class done in New York, in the same space of time, will be found equal in quantity and quality with what are considered large works there. And, comparing the cost, we are assured that it is money saved to encourage home manufacture, as work of this class could not be put down here for less money to give equal results.

With the view of drawing the attention of our citizens to our capacity of supplying our own wants, we would invite the builders of all such machinery to furnish us with reliable information on the subject, in order that we may give publicity to the world of our resources and capabilities of doing anything our trade may require.

Nothing connected with the foregoing vessels has been imported except the raw material. All the lumber, knees, etc., are of our own growth; all the shafts are of our own forging; all the castings, iron and brass, of our own manufacture; even cocks and gauges (things of importation) were manufactured in California, and many of the castings were made from Oregon iron. The day, we are convinced, is not far distant when California will be able to furnish iron in quantities, and at rates sufficiently low, to supply her own wants.

In connection with the present subject, we may mention the fact that the United States Government, a month or two ago, called for bids upon two steamers—one side-wheel and one propeller—upon specifications made to suit the Eastern market, all the timber in their construction being of Eastern growth, thereby placing them beyond the reach of California yards. This fact ought to be sufficient to call our attention to our own products, and cause some steps to be taken to bring the qualities of our timber directly before the authorities at Washington; as we feel assured, upon good authority, that timber of first rate quality can be had in our own markets.

GOLD-BEARING ASBESTUS.—We were shown on Tuesday last two specimens of gold-bearing asbestus, by Mr. Maddux, of Georgetown. The specimens were taken from a seam in the rock, in his claim near the above place, and are of the ligniform variety of asbestus, with gold diffused all through. This is the first gold-bearing asbestus we have ever seen, and we do not remember of ever hearing of anything of the kind.—*Placerville Democrat.*

The only instance of the kind we ever met with was in a specimen of hornblendic asbestus brought to this city, some two years ago, by Governor Goodwin of Arizona, and noticed in the columns of the PRESS at that time. The Governor had but a single specimen, and was unwilling to part with it, as it was intended for a friend at the East, although he assured us, gold, so associated, was frequently found in the mines in Arizona from which the specimen in question was taken.

Metallurgical Notes.

Decomposition of Metalliferous Silicates in Steam Under Pressure.

From a notice in the London *Mining Journal* of August 7th, we observe that Mr. A. L. Fleury, of Boston, has taken out patents for the treatment of gold and silver ores found in quartz, or of silicious substances generally, by a chemical separation of their constituents by agitating them in a steam-boiler under pressure, with fluor-spar, or any other fluorine salt or acid, and carbonic acid, as reagents. Whether this process is entirely original with Mr. Fleury, or borrowed from a caveat in the Patent Office, is a matter of little consequence at present; but the fact is to be recorded that a similar process was originated, and to some extent tested, years ago, by a well known mechanical engineer of this city, who was led to that method of dealing with ores of the precious metals by analogies from nature. Warm circulating waters under greater pressure of depth in the bowels of the earth, were looked upon as the agencies of decomposition, re-distribution and concentration of the metals in veins. Such is the *modus operandi* of vein formation now generally recognized by geologists and chemists as the leading agency of nature.

In Mr. Fleury's artificial imitation, the pulverized gold or silver ore is mixed with from 5 to 25 per cent. (according to the more or less silicious nature of the ore) or fluor-spar, cryolite, or refuse from the working of the cryolite, or any other suitable fluorine salt or acid, and when thoroughly mixed together the mixture is placed in a strong boiler, which should have a stirrer arranged inside in such a manner as to permit the agitation of the mass, in order to prevent the material from adhering to the bottom. About one gallon of water is then added to the mixture for every pound. The said boiler is so arranged that a pressure of about 60 lbs. can be kept up for about two or three hours, the escape being so regulated that the vapor can be condensed in a cistern of water. When the boiler is closed and the valve fixed, as above stated, he introduces into and among the agitated mixture steam and carbonic acid, until the whole is dissolved into an opalescent milky liquid. The carbonic acid can be produced by any of the known processes, and either injected alone by its own pressure, or by a Giffard's injector introduced with the steam. The quantity of carbonic acid should be about one-quarter of the quantity of the steam injected. After the solution is complete the steam and carbonic acid are shut off, and the whole is allowed to cool down to about 200° Fahr. The liquid is then to be passed through a properly constructed amalgamating bath, where every particle of suspended metal is absorbed by the mercury, and the gold is taken up, and can be obtained in the usual way.

The liquid obtained is separately valuable as an article of commerce; making with lime, oxides of iron, zinc or lead, an excellent fire and water-proof paint; with sand or clay, cement for roofs; with paper pulp or sawdust, etc., a molding substance for useful articles resembling papier-mache; and with white quartz sand, slightly compressed, white flint marble for statuary.

Whether nature's chemistry can ever be imitated economically, in the reduction of special gold and silver ores, in large boilers with nature's own cheap reagents, appears to be a question worthy of inquiry and examination by practical chemists. The road once opened and made plain, there might be little more difficulty in it than in the very simple practice of amalgamation.

DEETKIN'S METHOD OF GOLD CHLORINATION, as practiced at the Eureka mine, Grass Valley, is thus described by the *National:* The sulphurets are thrown into one end of a long furnace and are gradually worked down to the lower end where the heat is most intense. When thoroughly roasted, they drop through a flue into a second furnace, are mixed with salt, which is scattered over them by the shovelful, heated again, and then removed and cooled. The sulphurets are now placed in vats holding from three to six tons, and treated with chlorine gas. The oxygen of the manganese combines with the sodium of salt and forms soda; the soda then unites with the sulphuric acid forming sulphate soda; the protoxide of manganese also combines with the sulphuric acid forming proto-sulphate of manganese; the chlorine contained in the salt having no affinity with any of the other substances, is set free. The precipitate is washed, collected in a filter, dried, mixed with a little borax and saltpeter, and melted, and comes out of the crucible in the shape of chemically pure gold, worth $20.67 per ounce, while the gold obtained from the quartz nets only about $17.25.

Estimation of Losses in Milling.

Prof. Partz, of Oakland, remarking upon the "strange indifference existing amongst mine owners and millmen," says:

Generally persons engaged in gold mining seem to hold to the maxim that in certain things ignorance is bliss, and prefer to "go it blind" rather than see that the material, from which handsome dividends might be paid, is running to waste. Sometimes, however, and particularly when the losing part of the business assumes serious proportions, and "to be or not to be" becomes the question, the mill doings *are* investigated; but even then the manner in which trials are made is, with rare exceptions, based upon erroneous premises, and the results obtained are far from being conclusive. In at least nine cases out of ten, the course pursued is: to catch a pan full of tailings, or to take samples from deposits near the mill, and have them assayed to see how much gold has run off with them. If the ore has been coarsely pulverized, or if a portion of the gold it contains is enclosed in sulphurets, such trials merely show that more gold might have been obtained had the ore been reduced to a finer state, or had the sulphurets been collected by concentration. As regards all that gold which has escaped in a free condition, they show nothing, because particles of gold that have once become suspended in flowing water are not apt to settle so readily as to be found near the mill, but may rather be looked for about the slimy deposits far down the creek or gulch along which the mill water takes its course. The only reliable mode of ascertaining the amount of gold or silver lost in milling, consists in having a considerable quantity of average ore pulverized without the use of water, and a sample, taken from the whole mass, subjected to a fire assay. In the absence of more convenient means for the reduction of say half a ton of ore to dry powder, any old arastra will answer the purpose. If the ore to be tried contains gold in coarse grains or threads, the matter becomes a little more complicated. In that case, from the sample taken for assaying all coarse particles of gold (such as are not likely to float in water) are removed, whereupon a current of water is turned on the ore which furnished the sample, until, under constant stirring, most of it is washed away. The remainder is still further reduced in bulk by "panning," until only coarse gold is left, from the amount which, together with the result of the assay, the value of the ore is determined. Results thus obtained are not absolutely correct, but sufficiently so for all practical ends, provided the trials are made by men expert in the kind of manipulations referred to.

In fine gold the losses are shown to be often as high as seventy per cent. In silver ore, the losses are also great; but as all silver ores must first be decomposed before amalgamation takes place, the results depend so much upon chemical reactions that no general estimate of probable losses can be arrived at. In mixed ores of gold and silver, Mr. Stretch's table of results on Hale & Norcross ore, in J. Ross Browne's Report, show a loss of 14¼ per cent. of the gold and of 48½ of the silver contained in the ore; a circumstance of proportion not easily accounted for.

AWARD OF PREMIUMS.—The full list of premiums awarded at the recent Mechanics' Fair is not yet ready for the press; but will undoubtedly be completed in season for our next issue.

WE acknowledge the receipt from the Secretary of the State of Oregon and from A. Roman & Co., of a batch of new books, which will be noticed in our next issue.

The San Joaquin Valley.

[Written for the Mining and Scientific Press.]

EDITORS PRESS:—As one travels through a section of country he must necessarily form some kind of an idea of it; and as every one receives impressions through the channel of his own thoughts, they must be moulded either in visionary or in real forms, in poetical or practical shapes, as suits the capacity and personality of the observer. Happy indeed is he who is endowed with the vision and wisdom to see and understand the material value and to enjoy the ethereal beauty and charming grandeur of nature. But as it is the province of your paper to deal only with the practical, I will endeavor to give a condensed idea of what I saw and think of the great San Joaquin Valley.

EXTENT AND CHARACTER OF THE VALLEY.

Alighting in the midst of grain fields from the cars of the W. P. R. R. at Corral Hollow Station, I proceeded in a southeast course up the valley on the west side of the San Joaquin river. This strip of valley between the river and the Mount Diablo Range, and running parallel with it, is about twelve miles wide for a distance of about fifty miles, when it widens to about twenty-five miles, and extends over a hundred miles in the same direction to Tulare Lake. This magnificent reach of valley is fringed on the left with the living green of river foliage and with the grass-covered mountains to the right—wriukled as with age and scarred with gorges, the scars of combat with hidden forces—mountains that have deposited the rich alluvial soil of light friable adobe at their feet; soil that two years of culture has proved to be equal to the very best wheat land in the world. This land, which three years ago was occupied only by roving bands of cattle and Mexicans, and two years ago was selling at $2.50 per acre, is now held worth $10 to $30 per acre, and much of it is occupied by an industrious and thriving population.

LAND GRANTS AND SPECULATORS.

The land immediately along the river is covered by grants for a hundred miles—grants that have never invited settlers, but supported immense herds of cattle. Railroad and other speculators have monopolized the balance, so that the poor man must go begging. These speculators and their advocates will tell you that but for them the land would have never been considered worth tilling; and that it is their energy and foresight that is the making of the country. While we grant that railroads are necessary and some capital is indispensable, we must insist that it is better for the toiling settler to occupy the land at Goverumeut rates of $1.25 per acre than to have to pay a tax of $5 to $50 per acre to some enterprising speculator.

But, smothering all "contempt" of capital, it is certainly pleasing to see the valley become settled by intelligent producers, who will strive to make the most of their labor toward the development of the country. Buildings going up, orchards and vineyards and gardens in contemplation, the making of home with its ennobliug joys, is the aim of the earnest settler.

The machinery that farmers are using, and the improved machinery that they still demand, is a marvel, and must occupy the minds and muscles of your worthy mechanics in devising and making. Indeed, the farmer himself, surrounded by his cultivators, his harvesters, etc., must either consider himself a mechanic or feel the need of being one. At all the landings along the river I noticed towns springing up aud exhibiting substantial evidence of present prosperity and a hopeful condition of things in the future.

THE EAST SIDE OF THE VALLEY—SOIL, ETC.

Crossing the San Joaquin to its east side, we seem to be in a different country. We find the soil generally sand; the sun seems hotter and the air dryer. The coast breezes that gently filter over the Diablo Mountains and bathe the plaiu we have just left in soft delicious breath, here seem lost in the feverish radiatiou of scalding sands.

The soil on the east side of the San Joaquin is the sediment of the Sierra Nevada waters. Well-diggers find adobe a few feet through the light surface alluvium. Although so much wheat to the acre can not be produced here as on the adobe soil, yet for many purposes this grand country —fifty miles wide by two hundred miles long, watered by numerous rivers aud creeks, and dotted with farms and clustering villages—may excel the world. Such trees, vines, plants, etc., as will reach with their roots the underlying strata of adobe —a mine of inexhaustible wealth to the farmers—must certainly attain the maximum of growth and productiveness. Every nurseryman knows that the fig, grape and walnut send roots deep into the soil. So does alfalfa, and many other plants. When once this subsoil is reached no drouth can ever affect the growth or vigor of the plant. I fearlessly predict for this immense tract of country the best raisin vineyards, the fiuest fig aud nut orchards and alfalfa meadows that the world can produce. This rich adobe crops out, or rather is not covered with saudy soil, in some localities. Such places are magnificent wheat fields.

Do not understand me as insinuating that the sandy soil is itself poor. On the contrary, it is rich in earthy salts and in vegetable mold. With irrigation it will produce anything, as can be seeu along the river bottoms. But as it has not the attractive capacity for water, nor the capillary power of drawing from beneath, it soon dries out on high land. Where this light soil covers adobe thinly, as it does over large tracts of country here, it insures whatever reaches the subsoil against any drouth.

SPECIAL IMPROVEMENTS.

If space allowed, I would like to mention many permauent improvements that I noted. I will give one item, viz: Perkins, Cressey & Co's flouring mill, built last year at Paradise, a thriving village ou the Tuolumue river, at a cost of $40,000. Two run of stone, 4½ feet burrs; power, one of Goss & Lambard's 50-horse power engines. They do grist work for thirty miles around, and find a ready market for all the flour they make. S. H. H.

COÖPERATION IN NEW YORK.—A carriage manufacturing firm in New York City has adopted a plan, to go into operation next January, whereby each of the employés is to share the responsibilities and the profits of the establishment, as follows: In each of the departments of the business local trades-unions are to be organized, and from these three members are to be chosen as a Board of Control. In addition, a Board of Governors, to consist of the Presidents of the Unions and the members of the firm, is to be organized. This Board, of which a member of the firm is to be President, is to have the supreme management of the business. The profits at the end of the year are to be divided among the employés according to their earnings, after allowing a reasonable percentage to the capital invested in the business.

THE number of threshing-machines in the United States is estimated to be about 229,000.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See fellowing extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

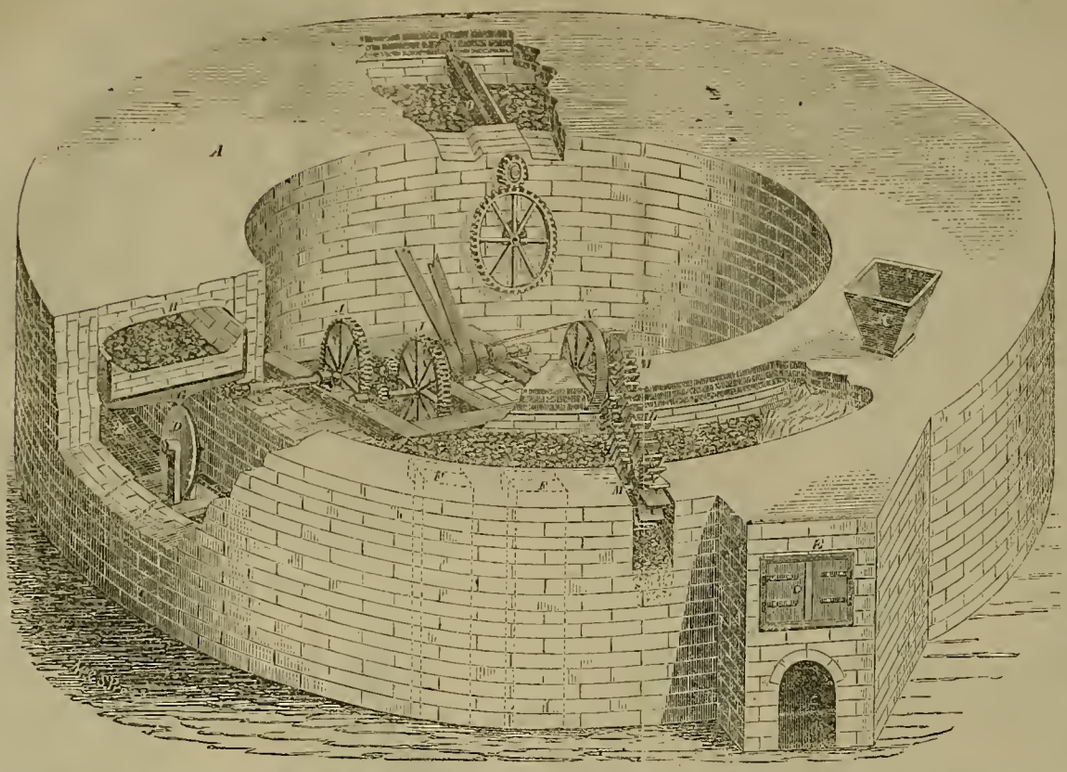
THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec.* 19.

Fred. Ernst's Patent Rotary Roasting Furnace.



This is a mechanical furnace, which does away entirely with manual labor, excepting a fireman. It charges, roasts, stirs, and discharges the ore by a very simple mechanical contrivance,—in fact performs all the operation required in the oxidation or chlorination process of roasting gold or silver ores.

The ore is taken by means of an elevator from the battery, and is discharged constantly and regularly into the hopper, *K*, from whence it reaches the rotating hearth, *G*. This hearth consists of a cast iron orbicular ring paved or lined with bricks, and revolves on a series of iron rollers, *D*, and is kept continually in motion by means of the gearing, *J*. This gearing has two gear wheels, three feet in diameter, and pinions to regulate the speed from the cone pulley, increasing or diminishing it to conform to the required slow motion of the hearth, *G*. The hearth so charged and running constantly carries the ore into the first heat, which is next to the flues, and so passes all the different temperatures of the furnace, thus effecting a very uniform heating and chemical action on the ore; at the same time it has also to pass the stirrers, of which there are different kinds,—stationary and movable ones,—the number and speed of the latter varying according as the ore contains more or less sulphur. The movable paddle stirrers are shown at *O*. These movable stirrers are connected with the gearing under the iron bed of the hearth, *G*, as shown at different points, until it passes the fire-bridge, where it receives its ultimate and highest heat, and is then discharged by the disebarging apparatus. This discharging apparatus consists of two chain or rag wheels, *M*, *M*. These two chain-wheels drive a double endless chain with inserted plates of iron (scrapers). The chain hanging loose underneath between the wheels draws these iron plates through the cavity of the hearth, and so discharges constantly the roasted ore. To keep the current of air constant throughout the whole length of the furnace, the arch over the hearth decreases slightly from the fire-bridge toward the flues. For concentrated sulphurets it may be advantageous to increase the circumference of the hearth. The advantages claimed as attainable from the use of this machine are—the doing away with a large portion of the costly hand labor ordinarily required, and the better and more thorough accomplishment of the same by machinery. A great saving of fuel, not only through the length of the hearth, but also for the reason that all the gases which are lost by other furnaces are economically employed in this as a substitute for other fuel.

The furnace is so constructed that the large access of air required for the oxidation of the ore, in addition to that demanded for the consumption of these gases, does not operate for materially lower the temperature in the furnace. When the ore in this furnace is once desulphurized, the gases cannot form any new combination with the ores or metals therein, for the reason that while the currents of air and gases are moving to the rear, the furnace hearth is constantly advancing in an opposite direction.

The construction of this furnace is of the simplest kind, and all the necessary castings can be easily transported even on mule-back. The loss of the silver by sublimation in present furnaces, it is claimed, is avoided in this, as the silver condenses before reaching the flues; the distance being great, and the heat diminishing gradually until the gases reach the point of final exit. Liberal terms are offered to parties who desire to use this furnace. Further information can be had by addressing the Inventor and Patentee,

F. ERNST, San Antonio, Lower California, Mexico,

Or by calling upon H. W. SCHMIDT, Druggist, Kearny street, corner of Sacramento, or at this office.

WALTHAM WATCHES.

Let every one who wants a Watch, read this carefully.

Especially if in some remote out-of-the-way place.

Now that the railroad is open, we propose to give the residents of CALIFORNIA the opportunity of getting single genuine Waltham Watches at the

Lowest New York Wholesale Prices.

We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or

REFUND THE MONEY.

As an indication of the Prices, we will quote one Watch from our list. The P. S. BARTLETT, *Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,*

$28 in Greenbacks, or about $20 in Coin;

All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,

HOWARD & CO.,

Meetings, Elections, Etc.

S. F. Dock Co.—Nov. 8. President, H. F. Williams; Vice President, A. G. Abell; Treasurer, Thos. Anderson; Secretary, E. C. Lovell. Trustees: H. Rosekranz, H. B. Brooks, W. W. Neal, H. O. Howard, D. W. Grant, Thos. Anderson, W. H. Bryan, W. H. Ladd and S. S. Piper.

Glenwood M. Co.—Oct. 29. President, A. H. Jordan; Secretary aud Treasurer, O. D. Squier.

Rationale of Losses in Float Gold.

To ascertain how long and under what conditious miuute particles of gold would remain suspended in water, and to ohtain, if possible, a clew to the cause of their suspension, Prof. Partz uudertook, while engaged in gold mining in North Carolina, in 1854, a series of experiments; and, although they were carried on, he says, without proper facilities aud hy the aid of makeshifts, their results were neverthcless sufficiently conclusive to convince him—1st, that fine particles of gold would remain afloat in water of common temperature for over 24 hours; and, 2d, that when the temperature of the water was raised to, or near to, its hoiling point, the suspended particles of gold would subside. Reflecting on these results, he was reminded of the well known property possessed by platinum of coudeusing gases upou its surface, and it seemed no far-fetched hypothesis to assume that gold, and probahly most other metals, possessed the same property, though in a lesser degree. Upon this supposition the fact that particles of gold did not sink in water in accordance with their specific gravity was readily explained, because the buoyancy of a film of air or other gas adhering to them would more or less conuteract their weight; and as the surface of hodies relatively increases as their hulk diminishes, it was plain that the smaller the particle of gold, the more apt it must be to be kept afloat by a film of gas upon its surface. It also became ohvious that when the water was heated to a certain degree, the particles of gold suspended therein must subside, hecause the film of gas sustaining them would be expanded and removed.

He says of his experiences that led to these tests: I observed that ores worth hy assay abont one dollar per hushel (100 pounds) were amalgamated in Tyrolean bowls, stirring tubs, rockers or other apparatus through which the pulverized material with the water from the stamps was passed, they would yield only from 25 to 30 cents worth of gold, while the same ores, ground and amalgamated in arastras or Chilean mills, with no more water than was necessary to form an easy flowing pulp, would yield fully douhle that amount. I also observed that by letting steam into the pulp the yield would be still further augmeuted. The great loss in working with a coutinnous current from the stamps could only he accounted for on the supposition that most of the gold escaped with the water, despite its high specific gravity.

On this peculiar characteristic of metals to condense gases, Overman is cited (Metallurgy, p. 282) as follows: Iron is hy far specifically heavier than quartz, still fine iron filings will float on water, while fine sand sinks directly. Carhon has not the weight of clay, yet fine carbon siuks sooner in water than clay; hut not so in air. Gold is hy far heavier than silex; hut we may ohserve by means of a microscope a multitude of fine particles of gold suspended in water, while we cannot detect the slightest particle of silicious matter, however fine it may be; the latter will suhside more quickly than visihle particles of heavy gold. All the metals appear to have a tendency to float in water when in fine particles, some more than others. This is caused hy a particle of gas, either air or water gas, adhering to the particles of metal, which causes it to be light and float, or hecome suspended. Precious metals appear to possess more of this quality than others. Sulphurets of metal, oxides, salts, and in fact all componud matter, do not manifest it. The size of a particle, and its form, have also some influenco in causing heavy matter to subside in water; a large grain will in all instances sink faster than a small one.

The last spike of the V. & T. R. R., of silver, is to be driven on the 15th inst.

An Established Remedy."—"Brown's Bronchial Troches" are widely known as an established remedy for *Coughs, Colds, Bronchitis, Hoarseness*, and other troubles of the *Throat and Lungs*. Their good reputation and extensive use has brought out imitations, represented to be the same. Obtain only "*Brown's Bronchial Troches.*"

The Pain Killer is hotb an internal and external remedy.

The Pain Killer should be used at the first manifestation of cold or cough.

The Pain Killer.—Don't fail to keep it in the house ready for use.

The Pain Killer is an almost certain remedy for Cholera, and has, without doubt, been more successful in curing this terrible disease than any other known remedy, or oven the most eminent and skillful physicians. In India, Africa and China, where this dreadful disease is ever more or less prevalent, the Pain Killer is considered by the natives, as well as by European residents in those climates a sure remedy.

The Pain Killer.—Each bottle is wrapped with full directions for its use.

The Pain Killer is sold hy all druggists and dealers in family medicines.

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. no6

Returned.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

Wanted.—To rent a house of about six rooms, in a healthy location, near the business center of the city, for a gentleman, wife and baby. Will purchase or rent the furniture. Address X, box 17, P. O. San Francisco

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18 3m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

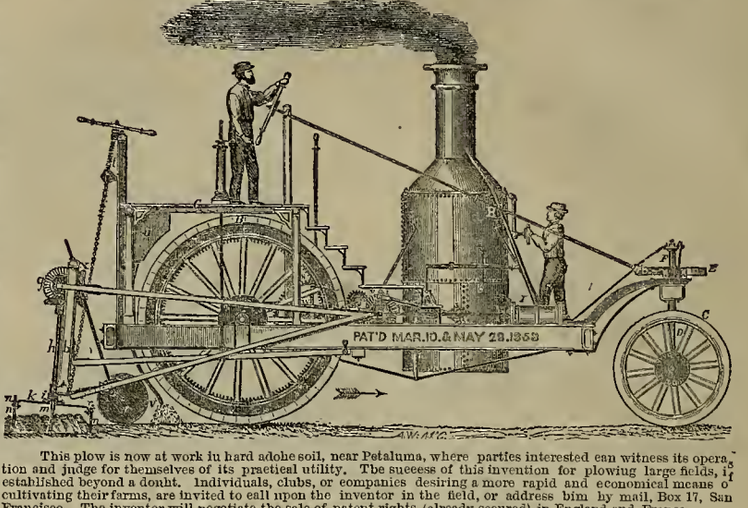
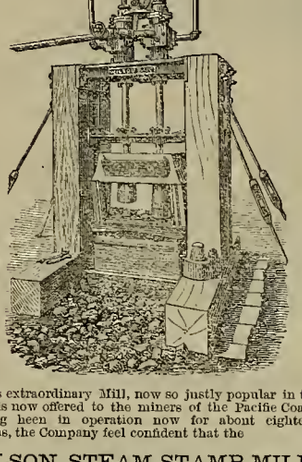
The Standish Patent California Steam Plow.



This plow is now at work in hard adobe soil, near Petaluma, where parties interested can witness its operation and judge for themselves of its practical utility. The success of this invention for plowing large fields, if established beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of cultivating their farms, are invited to call upon the inventor in the field, or address him by mail, Box 17, San Francisco. The inventor will negotiate the sale of patent rights (already secured) in England and France.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to he readily understood hy the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

Oil Cake Meal.

THE BEST FEED KNOWN

For Live Stock.

We desire to call attention to OIL CAKE MEAL, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal; and in the U. S. Government Report of the Department of Agriculture for 1865 it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz.: Indian Corn Meal, 11 pr. ct.; Barley Meal, 13 pr. ct.; Oat Meal, 18 pr. et.; Oil Cake Meal, 22 2-100 pr. ct. For life-sustaining properties for all stock exposed to sudden changes of weather or overdriving it has no equal,

FOR MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any other feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other feed; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It will improve it to soak it for six or eight hours, the effect being to increase its hulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot he found in any other feed—the beef always being more tender and juicy and of much finer quality than when fattened on any other feed; and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness, evenness and glossiness of the hair.

FOR SHEEP there is no article of feed known that produces such fine mutton or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price ($28 per ton) it is the cheapest feed in market. It is now selling in New York at $42 per ton, gold; at $50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this meal from those on this coast hy whom it has been thoroughly tested has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale hy the Grain and Feed dealers, and at the manufactory, King street, near Third. All orders will receive prompt attention. Address—

The Mining and Scientific Press commenced a new volume with the new year. It is a credit to the State, and to the mechanic or miner, is a great source of valuable information. It has every appearance of prosperity, and we hope it may continue growing in wealth and influence.—*Pajaronian.*

Wilson's Steam Stamp Mill.

[Written for the Mining and Scientific Press.]

EDITORS PRESS:—On my arrival here, I found the quartz community considerably interested on the probable revival of quartz mining, and business in general, by the introduction of the Wilson patent steam stamp mill, which is now being erected on the Vigilance quartz mine, near this city, and in a few days will be in operation. The results stated to be attained by this mill in the older States and Territories is truly remarkable; and if the two being erected in this State produce the same results as in other States, it is fair to presume a great impetus will be given to quartz and cement mining, as well as such other business as follow in their train.

Being desirous of knowing all the particulars of the Wilson mill, and learning the inventor was in this place—having arrived from Philadelphia to superintend the erection of the first mill in California—I sought him out, and found him to be a gentleman posted in the manipulations of quartz from his large experience in this State (dating his pilgrimage hither from the palmy days of '49), and of decided mechanical abilities, the proof of which is the steam stamp mill that bears his name.

Together with a small party and the inventor, I visited the mine where the mill is being erected; and after listening to an explanation of the merits and peculiarities of the mill, one is impressed with its extreme simplicity, compactness and strength, seeming to justify one in believing that it is all, in point of durability, efficiency and economy, that is claimed for it. I regret very much I could not see the mill running; as, owing to the amalgamating works not being finished, the mill will not be able to run for several days. [An illustrated advertisement in another column will give the practical millman or mechanic an idea of its construction.—EDS. PRESS.]

The company now owning the Wilson patent very wisely concluded to perfect and thoroughly test their mill before bringing it to this coast. They have manufactured and sent out nine mills, seven of which are stated to be in active operation, producing results which, if the two being erected in this State carry out, will certainly entitle the inventor to the rank of a public benefactor. Several attempts have been made to make a steam stamp mill that will stand the severe test of practical work on mines; and I am assured that, with the exception of the Wilson mill, they have all been failures when put to large working tests. But Mr. Wilson's practical mining experience and mechanical skill, it would seem, has enabled him to surmount all difficulties and place his mill at the head of all crushing machinery. He has had his mill now in operation for about eighteen months, and demonstrated it to be all that is claimed for it; the first cost of which is considerably less than one-half that of its equivalent of any stamp mill, and doing its work fifty per cent. less cost than any known mill.

I predict for this mill a brilliant future; and think that all miners that have the future of this country at heart will join me in wishing the inventor a rich reward for the three years spent in perfecting an invention that will cause hundreds of mines to be worked by this cheap and apparently durable and economical mill; thereby benefitting the State immensely. I shall watch the progress of the mill, and keep you posted. TRAVELER.

[With our correspondent we hope Mr. Wilson's mill will realize the success anticipated for it. The more improved steam stamp (or other economical) quartz mills introduced, the better for our coast.—EDS. PRESS.]

Metallurgy.

MOSHEIMER'S Pioneer Mining School —AND— METALLURGIC WORKS.

ESTABLISHED.....1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to work any kind of ore, or mineral substances.

Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.

I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.

For terms, apply to JOS. MOSHEIMER, Practical Chemist and Metallurgist.

Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

G. W. STRONG,

ASSAYER AND WORKER OF ORES,

Effect of Hot Steam on Mortar.

The chimney of a flouring mill at Fairfield, Iowa, recently fell, causing the destruction of the entire mill. The catastrophe was caused by turning the escape steam into the brick flue near its base, and at this point the bricks could be crushed between the fingers, while the balance of the chimney was perfectly solid. This action of hot steam on mortar is a very important matter to be borne in mind. The *Architectural Review* thus comments: "Now it is strange that such errors can be committed by thinking men as to let in such a subtile agent as steam upon such an absorbent material as brick. With the exception of oil, there is no more searching power than that possessed by steam. And when we consider how liberally brick admits water into its pores, we cannot be surprised to see what the effect of the injection of steam must be on it. It is not impossible that common lime mortar was used in the brickwork, and that there was a total absence of 'pargeting.' We should, under these circumstances, be very much surprised indeed if such a chimney, under such a destructive influence, could stand for any length of time."

FIFTY-SEVEN CHURCHES in New England are said to have been either blown down or seriously injured by the late severe gale. The injuries were mostly confined to the towns. Some of the papers have taken them to task for not building their churches in a more substantial manner.

FOREIGN SHIPPING.—Of our last year's exports more than two-thirds went abroad in foreign vessels. Reason: laws which render it impossible for American merchants to build ships for themselves, or to buy ships built abroad.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever:* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Valuable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 90-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 60 or 60-horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

H. J. BOOTH & CO.

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, oetween Fremont and Beale, San Francisco.

Flue or Tubular **Boilers**, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their Inventions. 1v16tf

To Quartz Mining Companies.

To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—

One Steam Engine, 60-horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift Pump, 6 inches, of superior make and finish.
280 feet of 5-inch Iron Suction Pipe.
One large Water Tank.

And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.

The Company having ceased operations intend selling off their effects as speedily as possible.

For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or R. W. HASKELL, Pacific Fruit Market, San Francisco 24v18-1m

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the office, 220 Fremont street,

1v1 San Francisco.

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,

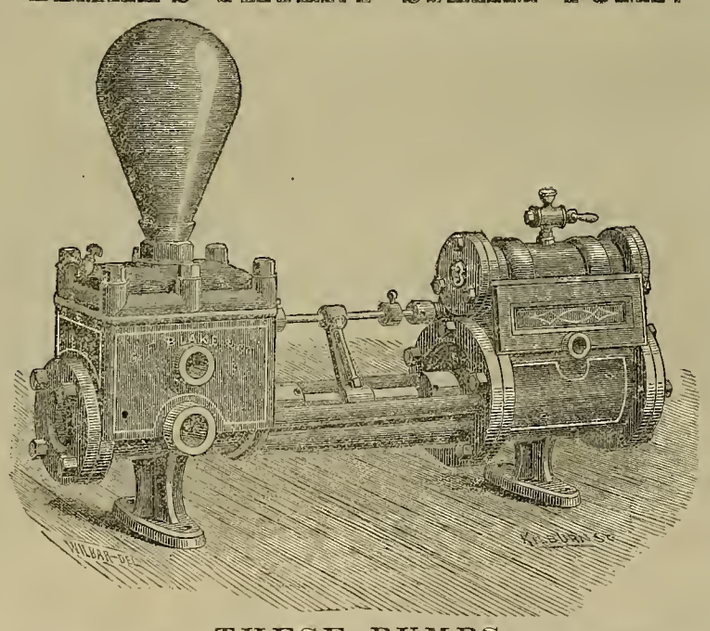
BLAKE'S PATENT STEAM PUMP.



THESE PUMPS

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—specially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

It is POSITIVE UNDER ANY PRESSURE. *May be run as slow or fast as may be desired.* Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility. Will start at ANY point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having NO DEAD POINTS, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever.

The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes;

IN BREWERIES, TANNERIES, SUGAR HOUSES, FACTORIES, MILLS, LAUNDRIES,

And as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. TWELVE DIFFERENT SIZES are made, capable of throwing from 1,000 to 180,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,
112 and 114 California Street, San Francisco.

☞ Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded, 17v19

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All claims of patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveies, throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13 1y Stove Store, No. 1 Clay Street, below Davis.

[SPECIAL NOTICE.]

Winn's Patent Shampooing Apparatus!

By the use of the apparatus here shown, the unpleasant mode in which the operation of shampooing is usually performed, is converted into a neat and tidy process, very effective and decidedly agreeable. By the aid of this apparatus, the head is washed and scrubbed in a bath of water, of any desirable quantity or temperatnre, and the employment of which, upon the top of the head, is productive of the most delightfully agreeable sensations, such as impart an entirely new feature to the process of shampooing. The apparatns is tasteful as well as substantial in its construction; and its use is equally as effective when applied to the long, flowing hair, as worn by the ladies, as to the shorter hair of gentlemen's wear.

To form this apparatus, a rim or bottomless pan is first coustructed, with a gutta percha lining so devised and provided with an elastic strap, as to fit tightly around the head, helow the principal part of the hair. The drapery or curtain, which is seen to fall below the rim, is both for ornament and use; it serves to conceal from view the somewhat unsightly straps, lining, etc., which form the water-tight joint hetween

the head and apparatus thereto applied, and a subsequent elastic gutter, which is strapped tightly abont the head, at the extreme lower part of the hair, to catch any water which may possibly escape from the main apparatns. As seen in the engraving, each has a flexible tube appended, by which the water may be carried off to a sink or other suitahle receiving vessel, so that the person will have no occasion to leave his seat during the entire operatiou, or even to remove his neck-tie.

The soap-suds or any other shampooing fluid which may be employed, is poured upon the top of the head, within the rim, after it has been properly adjnsted, and a brush or mop, or sponge, or any other snitahle instrument, is then employed within the body of the liquid to clean the head and hair. The liquid is readily discharged through a stop-cock and the tube shown in the rear, and fresh water for rinsing applied, as often as may be desirable. Standards, with curved rests or supports, placed upon the shoulders, and adjusted hy screws upon the top, all shown in the engraving, are affixed for the purpose of taking the weight of the apparatus and a portion of the weight of the water from the head. The flexible rim which adjusts the apparatus to the head makes this device practicable.

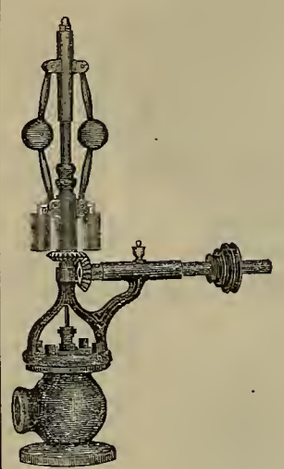
Previons to pntting on the rim an elastic strap is placed around the head to hold up the hair intended to be included within the rim, when it may he properly washed and cleansed. This arrangement is particularly useful and iudispensable in fact, in shampooing the head of a lady with flowing hair. This combined apparatus renders the process of shampooing as easily and as readily performed for a lady as for a gentleman. Mr. M.L. Winn, of this city, the inventor and patentee, exhibited his apparatus and the practical employment of the process, in the Mechanics' Fair, and will soon open a saloon in this city. The patent was obtained by the M. & S. Press Patent Agency.

GEORGE T. PRACY'S

MACHINE WORKS,

109 and 111 Mission Street, between Main and Spear,

SAN FRANCISCO.



MANUFACTURER OF

PRACY'S IMPROVED

Patent Steam Engine Governor,

The Simplest and Most Sensitive Governor Built.

This Governor is made of the best material, the shafts being of cast steel and the bearings small, thereby avoiding the use of heavy balls and springs, running at a high velocity and maintaining a uniform speed. All sizes of these Governors are kept constantly on hand, and can be seen in operation at my works.

I also take pleasure in informing the public that during my recent visit to the East I became Sole Agent for

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger, heats more rapidly than any other; change of temperature has no effect on them, stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

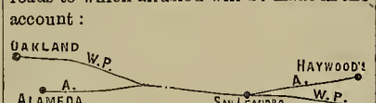
The Western Pacific and Alameda Railroad Disaster.

The present has been a year most prominently marked for the number and magnitude of its disasters. Explosions and fires in mines, disasters upon rivers and railways, have fallen thick and heavy upon us, in every direction. Scarce had the sound of rejoicing at the completion of the last link of the Pacific Railroad died away in our neighboring city, and while the emblems of joy were still to be seen in her streets, the entire State was horrified at the announcement of a most terrible railway accident, almost at our very doors. The painful, horrible story of Sunday morning last is already familiar to our readers—indeed, borne abroad on the wings of lightning, it has been read in almost every civilized country on the globe.

Desiring to place upon record, minutely and accurately, the particulars of this calamity, the proprietors of the MINING AND SCIENTIFIC PRESS promptly dispatched a faithful artist and a competent reporter to collect every important fact and to secure accurate drawings of the appearance presented at the scene of the collision. The correctness of the pictorial representation herewith given, will be indorsed by every individual who was present immediately after the dead and wounded had been removed from the wreck. The cars not seriously injured, on both trains, have been omitted by our artist, for the reason that their presence is unimportant, and would add too much to the length of the representation, to give the more striking portions of it in sufficient detail. The omitted cars are as follows: On the Western Pacific train, which occupies the left of the picture, a passenger and two silver palace cars on the extreme left of the train, and a baggage car between the telescoped cars and the wreck of the engines. On the Alameda train, the cars not shown, are two passenger cars on the extreme right. The representation not being designed to produce a sensational effect, all human figures, either dead or alive, have been purposely omitted; our aim being merely to show the effect of the colision on the train.

In order that our readers may more fully understand the circumstances under which the collision took place, we give the following diagram, showing the different roads to which allusion will be made in the account:



An inspection of this diagram reveals the fact that both the Hayward and the Western Pacific trains pass over a short section of road in common, on their way—the one to Oakland, and the other to Alameda. The testimony before the Coroner shows that the Western Pacific and the Alameda trains both left their respective stations on time, and ran upon time to the moment of colision, about 9 A. M., which occurred at the small break in the diagram, and about six miles from Oakland Point. The collision occurred in a wheat field, at a very low place, over which hang a dense bank of fog, about two miles wide, where it crossed the track. Had it not been for this fog, the trains would have seen each other and avoided the collision. The engine of the Western Pacific train had just passed a low culvert beneath which stands a small pool of water.

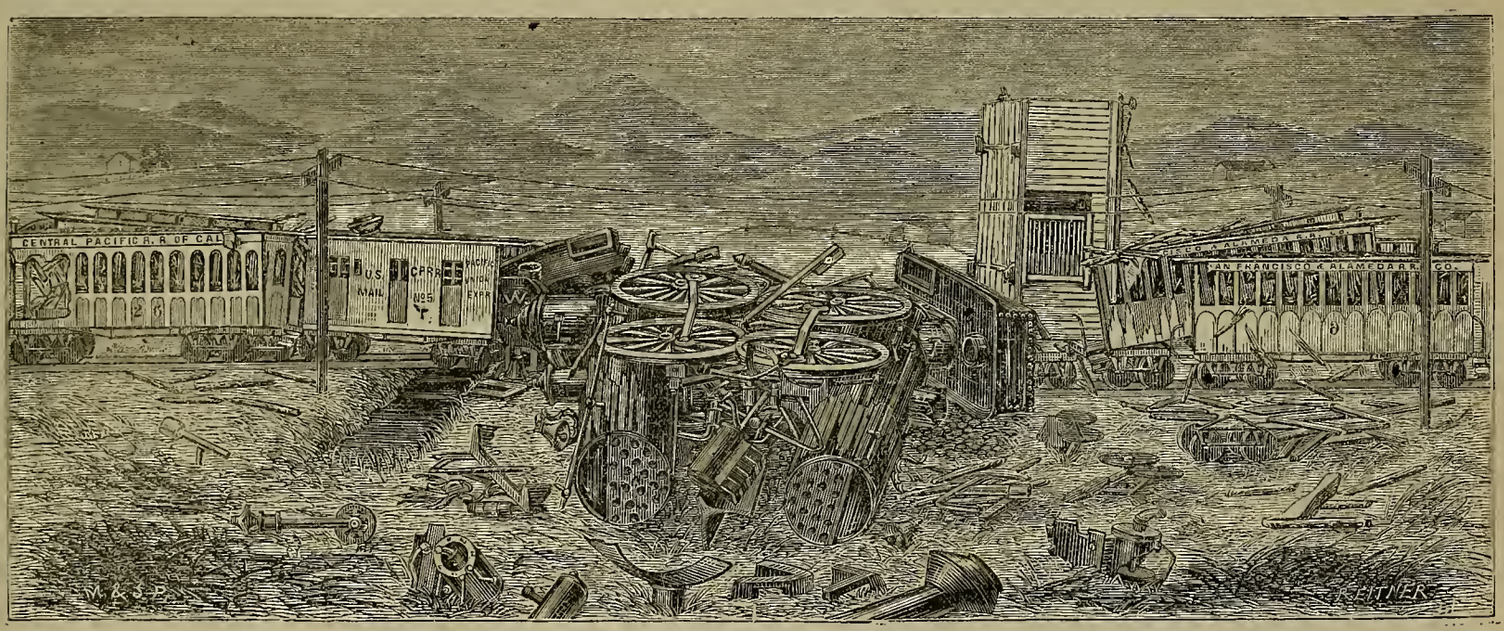
CAUSE OF THE COLLISION.

From the testimony taken before the Coroner, it appears that the time-table for Sunday, which differs from that of week days, brings the two trains at the junction nearest Oakland at very near the same moment; but requires the Western Pacific, in case it reaches there first, to wait until the Alameda train has passed. A switchman is stationed there, whose business it is to notify the Western Pacific, on its arrival, whether the Alameda train has passed. When that is not the case, and it is therefore known that the Alameda train is liable to be on the track, it is the business of the switchman to display a red flag, as a sign of danger, at sight of which the Western train stops. On Sunday last the Western train approached, as usual, and as no flag was shown, it did not stop, but slowed down, as though the engineer fearing that there might be a mistake, desired to learn verbally from the switchman whether the track was clear. The testimony clearly shows that the engineer received from the switchman both signal and word to "go ahead." He did "go ahead," and to swift and terrible destruction to himself and near a score of others. It appears that neither saw the other until they had approached within four or five hundred feet, when both whistles were sounded simultaneously, and the two trains, each moving rapidly, came together with a terrible crash.

THE COLLISION.

We would again refer the reader to the representation which we give above, of the appearance presented by the cars after the dead and wounded had been removed. From the position of the locomotives it is evident that they must have met like two huge monsters in deadly conflict, grappled, leaped high into the air, interlocking their forward or driving wheels, and resting upon their rear groups of bearing wheels; after standing thus poised for an instant, both fell over on the westerly side of the track, towards the point where the observer is supposed to stand. The ornamental brass work, wood work, railing, etc., of the locomotives, was stripped from both, and scattered here and there over the ground. A massive cylinder weighing 500 pounds is seen in the engraving where it fell, hurled twenty feet from its seat. The fancy brass cover of the sand box of the Alameda locomotive was thrown twenty yards forward and lodged on top of the express car of the Western train, as shown. The mass of broken iron, ruptured tubes, fractured wheels, crushed wood work, steam chests, cylinders, etc., immediately about these two locomotives, cannot all be shown in detail, but enough is seen to show in a most frightfully vivid manner the tremendous power and force which had produced all this ruin. The ornamental work of both tenders, with their contents, was scattered about, or piled upon the track. As the two trains crashed together, the lifting and overthrowing of the locomotives was attended with such a powerful recoil upon the track as to force the timbers of the road bed down six or eight inches into the gravel, bending the heavy iron rail to a corresponding deflection. The force of the collision was felt half a mile distant, producing an effect similar to that of the vibrations of a slight

[Concluded on Page 324.]



FEARFUL COLLISION BETWEEN THE SAN FRANCISCO & ALAMEDA AND WESTERN PACIFIC RAILROAD TRAINS.

Farming and Gardening.

The Peculiarity of Alderney and Jersey Cows.

These cows take their name from two islands situated near together in the British Channel. There is but little difference between the two breeds—in fact many consider that they differ only in name. The great value of these cows consists in the peculiarity of the butter made from their milk. The difference between such butter and that made from any other breed is most easily recognisable, and its superiority undoubted. Its texture is more firm, almost like wax. It does not oil like other butter. The warmest weather we have on this coast would scarcely produce any perceptible softening effect upon it; no ice is required to keep it moderately hard when served upon the table in the hottest weather of the Eastern States.

It is said six quarts of cream from these cows will produce seven pounds of butter, while a pound of butter from a quart of cream from the best of other breeds is considered a large average. With the generally acknowledged superiority of this breed of cows, it is singular that they are not introduced in greater numbers into the dairies of the Eastern—especially in those of the New England States. Californians, who are just beginning to look seriously into the dairy business, should have a special care in the selection of their stock; as much depends upon that as upon almost any other one thing connected with the business. A poor selection of stock will almost assuredly be attended with failure.

Difference in the Quality of Eggs.—Though many farmers keep fowls and raise eggs for their own use and for market, there are but few who are aware that there is any difference in the richness and flavor of eggs produced by well-fed hens, and those from birds who have been half starved or poorly fed. The difference in size has been always recognized, and should be taken into account in sales; but for some reason or other never has been; still the difference in quality is even greater than that. The yolk of a well-fed bird is large, fine colored and of good substance, and the albumen or white, clear and pure; while the contents of one ill-fed is watery and meagre, showing that the parent fowl has been unable to properly carry out and complete the work nature had sketched. In order, therefore, to have good eggs, the fowl should be well fed, and provided with an abundance of fine gravel, that they may be able to grind and prepare their food for digestion. Of eggs, those from the domestic hen are decidedly the best, but those of ducks and geese may be used for some of the purposes of domestic cookery.

Acre Values of Crops.—The National Agricultural Report for the present year, now in the binders' hands at Washington, gives the average value per acre of crops for 1869 as follows: Tobacco, $93; potatoes, $74; cotton, $32; barley, $31; buckwheat, $18; wheat, $17; corn and hay, each $16. The average yield of wheat in California is set down at 20 bushels per acre; oats at 30, and corn at 45. The per acre yield of wheat and corn exceeds that of any other State in the Union—the general average being 12 of wheat and 25 of corn.

Damp Wheat Lighter than Dry.—If we subject one measure of dry wheat to the action of a damp atmosphere, and keep another equal measure in a very dry atmosphere, the former will of course give a weight to the exact amount of water absorbed; but when we measure out one bushel of dry wheat, and another of moist, we shall find, on weighing the two, that the moist wheat is the lightest.

Wounds on Cattle.

The treatment of wounds on cattle generally is quite simple, nature being much kinder to these animals than she is to us; as instances, wounds that would in the human being puzzle the surgeon, heal readily in cattle, almost without any application. After removing any dirt or gravel which would cause irritation, or prevent it from healing, the first thing to be considered is the state of the wound. Is it a punctured or lacerated one? If a punctured one, it is necessary to ascertain its direction and depth, which having been discovered, should have injected into it the tincture of aloes and myrrh, and fomentation applied to abate inflammation. In cases where a wound runs downward and the matter, unable to escape, collects at the bottom and seems to be spreading, a seaton passed in at the original orifice and brought out at the lowest part of the pipe or sinues will do well. In the case of a lacerated wound, neatness in bringing the divided parts together is essential in promoting a speedy and perfect cure with the remedy applied; any portion so torn as to prevent this from being done completely, should be removed with a sharp pair of scissors or a knife; bringing the edges well together, retain them by passing a needle and strong waxed twine deeply through them, making the stitches half an inch from each other, then place a little clean dry tow over the wound, and cover the whole by a bandage, closely, but not tightly drawn. Do not if possible disturb this for a couple of days; then, if upon examination it looks well and is doing as desired, dress it with the myrrh and aloes spoken of above by soaking a pledget of tow in the tincture; should there be any indications of proud flesh bathe the wound before placing any tow upon it with a strong solution of blue vitriol. Many persons are frightened with the profuse bleeding which sometimes takes place from deep or lacerated wounds; unless some large arterial trunk is divided, there is little if any danger of the animal bleeding to death. Sufficient blood, however, may be lost, to very materially interfere with the condition of the beast and leave lasting weakness; anxiety therefore, to stop the blood as soon as possible is not misdirected.—*American Stock Journal.*

Strawberries Grafted in Roses.—Among the late curious experiments of a Parisian florist has been the production of the very pretty novelty of roses blooming, and strawberries growing, on the same stem. This object is accomplished as follows:

In the autumn, a few common roses of good kinds on their own roots are planted in pots, at the same time a well-rooted strawberry vine, in good bearing condition, is placed with each rose and planted just beneath the stem of the rose. In the spring, when the runners push out, two or three of them are tied up to the stem of the rose. It is well known that the runners of the strawberry soon make their own roots, and in due time these roots are cut off, making the cuts as for a scion, and then grafting them into the rose-stem without cutting away the runners from the parent plant in the ground. They should be cultivated with great care to induce the sap upwards to the scions, cutting off all blossoms and many leaves from the parent plant. Thus treated, the strawberries will blossom and bear perfect fruit upon the rose-tree for some time, and present a most attractive appearance.

Diversified Agriculture.—The Los Angeles *News* says that a gentleman in that neighborhood has recently procured a tract of land to be devoted to the culture of small fruits for the home market, the supply of which has heretofore been quite too limited. Diversified agriculture is one of the wants of the State generally; and every step in that direction is one taken in the path toward general and permanent prosperity.

California Potatoes for Europe.—The Danish Consul of this city, Mr. Taaffe, has sent several boxes of selected California potatoes to Denmark, to be used as seed, with the hope that they will escape the rot, from which the north of Europe potato crop has suffered greatly for a number of years past. A similar shipment was made some ten years since to Scotland for the same purpose, and with most excellent success.

Stockton Correspondence.

[Written for the Mining and Scientific Press.]

Editors Press:—Stockton is most advantageously situated in the center of an immense agricultural region. I was expecting to find prosperity here; but was not prepared to see so much solid growth and activity. It is already in steamboat and railroad communication with San Francisco and the upper country, with a speedy prospect of a railroad the whole length of the great San Joaquin Valley south. Stockton is a lively, bustling "town," steadily and rapidly increasing in population, wealth and business; now the third city in California, it is a "candidate for second." It is already

A Manufacturing Town

Of no small importance; not of the finer fabrics of the loom, which must soon add its woof, but of the equally useful products of skilled labor applied to wood and iron. Iron works, machine shops, foundries, wagon and carriage factories, lumber-dressing mills, steamboat building, flouring mills, windmills, blacksmith and harness shops, large agricultural works, etc., attract attention, and many things demand special notice.

The Globe Iron Works

Of Messrs. Keep & Bargion, we of course visited. Supplied with the best of machinery, and employing the best of workmen, this establishment is not behind the times in usefulness. Here we found high and low pressure steam engines in progress of construction. The portable engines turned out at this establishment are nowhere excelled. Their boilers are especially adapted to the kind of fuel to be used—an important desideratum. They justly claim that their machinery is, in many respects, superior to any imported. Their horse-powers and the pumps of their own invention and patent, are certainly very superior. Messrs. Keep & Bargion also manufacture all kinds of mining and milling machinery, and cast house fronts and iron and brass mouldings of every description. They are the sole agents of Root's patent force blast blower, one of which afforded so much amusement at the late Mechanics' Institute Fair. I saw several in process of manufacture to fill orders. As the demand for mining machinery decreases, more attention is being given to the manufacture of farming implements.

The Stockton Iron Works,

Farrington, Hyatt & Co., proprietors, also form a creditable establishment, which appears to be full of business. These works are connected with the establishment of Matterson & Williamson, manufacturers of agricultural machinery, much of whose work is done by the Stockton Iron Works Company. A general view of

Matterson & Williamson's Agricultural Works

Is attended with much interest. Agricultural machines crowd the streets and sidewalks in the vicinity of the works, including plows, single and double, in three, four, five and six gang; plows for breaking and for stubble, for light soil and adobe; small and large plows, iron and steel cultivators, chisel and shovel teeth, harrows, seed sowers, horse-shoes, wagons, combined headers and thrashers, etc. It is a treat to visit such a shop as this, where the large buildings and sheds are all occupied by busy workmen, half hid in the whirling maze of humming machinery. In the midst of seeming chaos and confusion of fire and smoke and unearthly din, order reigns, and cheerful Labor asserts her peaceful power.

Matterson & Williamson have been farmers, and know what farmers need. They have obtained seven patents for useful inventions, and have invented many improvements not yet patented. Their first patent was as early as June, 1858, for a gang-plow; and I was assured by them that it is to-day a better gang-plow than many late patents. They also invented an improvement in double-edge reversible mould-boards and curved standards for plows. This is a very valuable plow, in an economical view. All of their gang for broken soil are of this description. Of simple construction, light, cheap and durable, they give universal satisfaction; and when any part gives way, it can be replaced from the manufactory. They have also patented an improvement in gang-plows, consisting of superior draft bar and castor wheel attached to single arbor. Also, an improvement in horse hoes, by making a straight, reversible self sharpening hoe; an improvement in horse hay forks, and an improvement in elevators, and table for feeding grain separators. They are the first inventors and patentees of the celebrated chisel cultivators; and they declare all other such cultivators to be infringements of their patents; but that, like many other patentees, they have been injured by parties using their invention for the same purpose, and involving the same principles claimed by them.

Mr. B. J. Marvin, the inventor of

Marvin's Patent Combined Header and Thrasher,

We found hard at work at this establishment, as he has been for the last ten years, and still inventing improvement upon improvement towards the perfection of his machines. Already a success—saving more than one-half of the expenses of harvesting and thrashing over the old headers and stationary thrashers—it must eventually supersede other harvesters. I have the assurance of Mr. John Fisher, a farmer near Stockton, who owns and has tested one of these machines thoroughly, that Mr. Marvin's patent combined header and thrasher will save three-fourths the expense, including wastage, of harvesting and thrashing, over the best single header and thrasher in use. It is claimed that with this machine three men and twelve horses will cut, thrash and sack twenty acres a day on an average. One thousand dollars or more saved on every 500 acres of grain harvested is too solid an argument to be resisted.

There were five of these machines sold last season, and several more are now being made for the coming season. Mr. Marvin showed me two very valuable improvements which he has recently made in his machines, and which will add greatly to its ease of motion and effectiveness in separating and saving the grain. These will be patented; and when applied, must recommend themselves to every practical farmer.

S. H. H.

[concluded in our next.]

Saving Seed Potatoes.—In saving potatoes for seed it is recommended that the tubes of such plants only should be selected as come to perfection earliest. Select the healthiest hills and avoid every plant for seeding purposes which displays any tendency to disease or departure from the characteristics of its own variety. If as much care was exercised in the selection of seed potatoes as there is in the selection of almost all other seeds, far better results would be met with than is now generally the case. Potatoes when designed for seed should be stored in a cool, dry, dark place and kept separate from the bins where the other lots are stored.

Sugar from Sweet Potatoes.—Recent experiments, it is said, have shown that by a powerful pressure ninety per cent. of the weight of sweet potatoes can be obtained in the form of a fluid, which will yield from ten to eleven per cent. of sugar. Careful cultivation might, no doubt, increase the sugar. Further experiments are to be made with the view of testing the value of the potato as a substitute for the sugar beet.

Preserving Potatoes.—We have mentioned in another item the shipment of small quantities of potatoes to Europe, for seed. One of these shipments was made some years ago, by the way of Cape Horn, and arrived in most excellent condition, although they were twice exposed to the passage of the tropics. They were packed in charcoal dust, which may hence be considered a most excellent medium for preserving potatoes.

Agriculture in Arizona.—Flour is selling in Prescott at $36 a barrel; butter at $2 per pound, and eggs at $2 per dozen.

Mechanical Progress.

The Velocimeter.

This is a new and ingenious apparatus for registering the rate of speed in running machinery, lately patented by a Missourian. It may be described as follows: There are two dials; an upper one, which is that of an ordinary clock, and a lower one figured from 0 to 60 or higher, which shows the number of revolutions per minute which the wheel attached is making. The index of this second dial is carried by a pinion moved by an upright rack-bar, in which is a pin resting upon a volute cam, or eccentric. This cam is so connected with the running machinery, the speed of which is to be recorded, that it rotates from left to right,—but is so connected also with the clock-work above, that it continues to rotate only three seconds at a time; that is, if that be the period taken as a unit in the construction of the apparatus. Now the faster the machinery is running, the more of a complete revolution will the cam make, and of course the higher will rise the rack-bar, and the farther round the dial will the index sweep. At the end of the three seconds, the cam stops and falls back to its starting position, and goes again through the same movement. The rack and pinion retain their position by means of a ratchet arrangement, unless the speed changes; so that the index remains stationary as long as the speed last indicated remains the same.

Attached to a locomotive, the index may note the number of miles per hour at which the engine is running.

The *Scientific American* of Nov. 13th illustrates and describes this apparatus, and says: "But the performances of this ingenious instrument do not stop with the mere indications of speed. It also records it; so that one may know at any time afterward the exact speed that was being made at any previous minute. A cylinder, by connection with the clock movement, is caused to revolve once per hour, winding upon itself a strip of paper from a spool. This paper is ruled with horizontal and perpendicular lines, similarly to that used on the steam indicator. A pencil fixed in the rack-bar marks the passing paper higher or lower as the speed is greater or less for the time being. The perpendicular lines indicate the minutes of time, while the horizontal ones represent the velocity. When the locomotive stops, the pencil will descend to the lowest horizontal line, and will there make its continuous mark, reporting the exact duration of the stoppage."

This registering apparatus is so arranged that it may be locked up within the instrument, and made inaccessible to any one but the keyholder. The paper may be replaced daily or oftener. Railroad officers may thus have in their possession an exact history, as to speed and stoppages, of the movements of every train upon their road; and an engineer will always have an indisputable witness, in his favor or otherwise as the case may be, to the speed at which he was running at the moment of an accident.

The Root Boiler.—This is made of wrought iron tubes, connected at their ends by cast iron heads and cast iron three-way elbows. Each tube is connected in this way at each end with three others, viz.: one above and two below, or two above and one below—these connections being alternately reversed. In this way a perfect circulation is obtained, and the steam enabled to rise freely through the water. This circulation is facilitated by the inclined arrangement of the tubes, which makes a number of the upper ones, which are only partly filled with water, serve as steam-drying tubes. The steam is collected in a transverse drum above."

Broom Sewing Machine.—The *Artisan* illustrates and describes a machine for this purpose, which has been on exhibition at the Fair of the American Institute, and which is the first ever devised. It is spoken of as being a perfect success, and as destined to work a revolution in broom-making. It attracted much attention and received a special premium. G. Stackpole, of New York, is the inventor.

Annealing Large Castings.

The *Practical Mechanics' Journal*, in an article upon the Palliser chilled shot, says the great drawback to the success in practice of the hardened cast iron projectiles has arisen from a tendency to burst before leaving the gun, the angular fragments scoring and wearing the rifling, so that the piece is soon rendered worthless. The reason of this is plain. The metal, when cast, hardening first at the surface, has its internal portions held under permanent tension—a tension so great that in some cases the shot have been known to split without any apparent cause while piled in heaps in the arsenal. Large iron castings have been known to burst on the removal in the lathe of the tough outer skin. In the chilled shot the exciting cause is the sudden heating and expansion of the shot by the surrounding gases. The remedy lies in providing for homogeneity in the structure of the projectile. This may be accomplished by the use in the first instance of white iron, in which case no chilling would be necessary; but with ordinary metal cast in chills, the hardening, however perfect at the outer portions, cannot reach the core of a ten-inch casting, and the desired uniformity is wanting. The plan suggested is to move the cast projectiles from the chills as soon as the metal has "set" nearly or quite to the core; place them in an oven heated to from seven to eight hundred degrees, and suffer them to remain, guarded from oxydation by influx of air or gases, until the gradual lowering of the temperature has brought them to the requisite cool condition. The time required for annealing in this manner a ten-inch solid shot is estimated at from ten to fifteen days. The method is worthy of testing by manufacturers who may have occasion to turn out chilled castings of any considerable size.

New Mode of Sharpening Files.—M. Wedermann's plan is as follows: Well-worn files are first carefully cleaned by means of hot water and soda; they are then placed in connection with the positive pole of a battery, in a bath composed of forty parts of sulphuric acid, eighty parts of nitric acid, and a thousand parts of water. The negative pole is formed of a copper spiral surrounding the files, but not touching them; the coil terminates in a wire which rises toward the surface. When the files have been ten minutes in the bath they are taken out, washed, and dried, when the whole of the hollows will be found to have been attacked in a very sensible manner; but should the effect not be sufficient, they are replaced for the same period as before. Two operations are sometimes necessary, but rarely more. The files thus acted upon are to all appearance like new ones, and are said to be good for sixty hours' work. M. Wedermann employs twelve medium Bunsen elements for his batteries.

New Method of Setting Tires.—A late English patent is for contracting the wheel,—instead of expanding the tire,—while the setting is being accomplished. This is done by hydraulic pressure. "As the pressure is applied and the wheel contracts, it is made to descend into a funnel-shaped support, so that when the external pressure is taken off of the rim, the pressure upon the hub, giving dish to the wheel, being still maintained, the contraction of the rim is kept up till the tire is placed around it. The hub being next released from pressure, the elasticity of the woodwork carries the hub back to its normal position with refereuce to the other parts of the wheel, a general expansion takes place, and the tire becomes permanently set."

Frictional Gearing.—A compressed elastic frictional gearing has been devised by Mr. Henry Hall, of Burton, which is likely to be extensively adopted. The invention consists in facing the wheels with hardened and compressed india-rubber. It is pointed out that among the advantages which the improved gearing possesses, especial prominence should be given to the facility and safety with which the gearing may be thrown in and out of action at the highest velocities. Its noiseless, smooth, and steady action, together with its cleanliness, are great recommendations, whilst its value as an economizer of power, cost and maintenance to all who employ extensive machinery is incalculable. With the improved gearing a greatly increased number of revolutions may be made without fear of injury or breakage.—*London Mining Journal, Oct.* 16.

Scientific Progress.

Gutta Percha and Caoutchouc.

Prof. Wurtz proposes to give, from time to time, notes of Berthelot's progress in his new general method of synthesis by *Hydrogenation*. This method is destined,—Prof. Wurtz thinks,—to exert an extraordinary influence in building up "the grand edifice" of Carbon-Chemistry. It is founded upon the idea of employing some hydrogen-compound of simple constitution and unstable nature, containing hydrogen in a *quasi* nascent form. Hydrosulphuric and hydrochloric acids have had applications of this kind; but to both there are objections. Berthelot's invention consists in the general application of *hydriodic* acid in this way. The fecundity of this new method of investigation is already astonishing. The first of those notes given in the *Chemical Excerpta* are upon the properties of the substances named in our heading.

"To throw some light on the question of the hypothesis often entertained that these hydrocarbons are derivatives of the *camphenic* series, or of very elevated polymeres of this group, Berthelot has submitted them to his method of treatment with a known amount of concentrated hydriodic acid. Pure hydrogen was evolved, whose measured volume indicated a residue of hydrogen left in combination, in the proportion of 0.0142 gramme of H for half a gramme of gutta percha, corresponding, as Berthelot inclines to think, to the formation of a saturated carbon of a very high equivalent, $C^{80}H^{82}$. The product, contrary to his expectation, contained no carburet volatile at low temperatures, or even below 360° C. It is *viscous*, and similar to melted caoutchouc. When heated, it puffs up greatly, through vaporization of intermixed water, to get rid of which is a slow and troublesome process. After this, it distils above 350° C. to an almost colorless thick and viscous mass. This product has the general reactions of the formenic hydrocarbons, resists bromine, cold fuming nitric and warm fuming sulphuric acids, etc. Caoutchouc behaves exactly like gutta percha, the product seeming probably a little more solid and less volatile, of which nevertheless he is not sure. The products, freed from water, did not solidify in eighteen months; but the mass offered, notwithstanding, some indications of crystals. These facts, he remarks, tend to remove caoutchouc and gutta percha from the camphenic group."

Although this product is made up of saturated hydrocarbons, as is *paraffine*, still its lack of tendency to crystallization inclines Berthelot to the belief that it does not belong to the same series as do the hydrocarbons of petroleum.

Prof. W. remarks in this connection that his *viscosine*,—noted in the abstract of his paper on Grahamite, which we gave in our issue of Oct. 30th,—should have been spoken of as the first *native* viscous hydrocarbon as yet distinctly isolated:—that having been his idea at the time of writing. To call it the *first* would not be correct, Berthelot having previously observed several.

The new Anæsthetic.—Dr. Richardson read a paper on chloral hydrate before the British Association in August at Exeter. From numerous experiments he concludes as follows: (1) Chloral hydrate administered by the mouth or by hypodermic injection, produces as Liebreich states, prolonged sleep; (2) the sleep it induces, as Liebreich also shows, is not preceded by the stage of excitement, so well known when chloroform is administered by inhalation; (3) the narcotic condition is due to the chloroform liberated from the hydrate in the organism, and all the narcotic effects are identical with those caused by chloroform; (4) in birds the hydrate produces vomiting in the same manner, and to as full a degree, as does chloroform itself; (5) the sleep produced by chloral hydrate is prolonged, and during the sleep there is a period of perfect anæsthesia; but this stage is comparatively of short duration; (6) the action of the hydrate is (as Liebreich assumes) first on the volitional centers of the cerebrum; next on the cord; and lastly, on the heart.

Dissociation.

In the November number of the *Journal of Applied Chemistry*, Prof. Chas. A. Joy has an article, in which he gives an analysis of the pricipal papers published upon this subject, from 1857 to the present time. The original articles amount, he says, to scarcely more than twelve; and these are scattered through journals in four languages.

The theory was enunciated by Deville in 1857 before the French Institute. It was that compound bodies could be separated by heat into their elements, and that the temperature of this "dissociation" for each body could be measured. From time to time since that date, he has published experiments in this direction. M. Cazin in 1868 says that the discovery establishes a remarkable connection between the molecular attraction of physics and the elementary attraction of chemistry. Dumas says it is one of the most scientific steps in modern times. Naquet thus states the doctrine: "M. Deville has been led to conclude, from his experiments, that in the decomposition of bodies by heat the phenomena are the same as in the vaporization of liquids. As the change of a liquid to the gaseous state requires a certain quantity of heat, which is entirely absorbed (becomes latent), in the same manner a compound body in order to be reduced to its elements, absorbs a quantity of heat equal to that which it disengages when it is re-combined."

Several recent geological writers have had recourse to dissociation to explain the origin of rocks. Sterry Hunt is one of these. Prof. Joy says: "It is somewhat remarkable that so important a discovery should not have been more generally discussed, and that the doctrines should not have found place in more of our best text books on chemistry. The technical applications of dissociation are of sufficient importance to attract the attention of engineers and inventors in all departments of chemical and metallurgical industry. If by an ingenious device we can dissociate water and appropriate its elements to our use; if we can change the form of our blast furnaces so as to use the dissociated gases before they re-combine on cooling; if we can as definitely fix the law of the tension of dissociation as we have determined it for the tension of vapors; if we can destroy and build up at pleasure by the application of the principle of dissociation, we shall be prepared to accord to Henry St. Claire Deville, for his grand discovery, a place in the front rank of the benefactors of his race."

A New Method of Demonstrating the Form of Flames.—The flame of a candle is a hollow cone, luminous on the outside only. To demonstrate this, M. Dufour cuts the flame by means of a sheet of water. The *Chemical News* thus describes the arrangement: A caoutchouc tube has, at one of its extremities, a gas jet; this jet has an almost semicircular slit of 0·4 m.m. in depth. The other end of the tube communicates with a reservoir of water placed at a convenient height. Upon a suitable pressure, the water flows out by the slit in the jet, producing a clear sheet, capable of preserving, for a sufficient length of time, an invariable form and size. The slit is placed in such a manner that the sheet presents a horizontal surface; and this will easily cut the flame of a candle, showing a perfect section. The hot gases and carbonaceous particles are carried off by the water. On placing the eye above the hollow cone, the luminous wall, etc., can be distinctly seen. Sections may easily be made near the wick or near the point.

M. L. Dufour suggests that this might be of service in the chemical analysis of flames. When a flame is cut by a sheet of water, the water draws off the gases. If the section be made with a sheet of air, it will be easy, by placing suction pipes throughout the length, and ending at fixed points in the interior of the cone, to collect the gases whose composition is desired to be ascertained.

Test for Prussian Blue.—Jerome Nicklés found that Prussian blue might be distinguished from the blue of indigo, or aniline, by means of fluoride of potassium, which bleaches it, while it does not so affect the other two.

[Continued from Page 321.]

earthquake. The first car upon the right, a baggage car, was driven upward and endwise with such force and in such a manner as to separate the body from its running gear and plant its lower end in the rear of the adjoining passenger car, while its entire body was thrown aloft and upon end, where our artist has correctly pictured it, standing, as it were, a monument of the surrounding ruin and destruction. The two first passenger cars of the Alameda train "telescoped," as shown, but not as completely as those of the Western Pacific, thus leaving more room for escape; moreover, there was also a less number of passengers on that train. Mr. S. P. Dunn, a passenger on the train, states, that he was sitting in the first passenger car, on the second seat from the door. When the crash came, his car was "telescoped" into the one adjoining, and the seats, furniture and *debris* of both cars thrown together in great confusion. Mr. D. was thrown with great violence, from his seat and badly injured. Mr. Presley Dunlap was standing in the center of the other car, talking with a friend. The car seemed to be driven back with great velocity. Mrs. Hoff and sister, of San Leandro, were sitting in this car, in front of Prof. Boulett, who was instantly killed. The telescoping car passed in and over the heads of these ladies, knocking them both to the floor, yet neither was injured beyond a few slight bruises.

Passing now toward the other end of the wreck, a baggage car (which is omitted for reasons already given) intervened between the express and the telescoped cars shown on the left. The scenes connected with this part of the tragedy at the moment of its occurrence we give substantially, as narrated by one of the passengers, Mr. Joseph L. Beard, to the reporters of the *Chronicle* of this city:

"At the instant of collision, Mr. Beard, who was seated in the smoking car which immediately succeeded the baggage car, felt that he was in the midst of a fearful accident. The car stopped with a jerk and the seats came piling up towards him, one on top of another, with fearful violence. The car next to the one in which he was, had "telescoped" into the one he occupied, and almost in a second the whole car was a wreck. Mr. Beard was seated near the front door of the car, and on the outside or passageway end of the seat. When he experienced the shock, Mr. Beard instinctively pressed his hands down upon the seat, endeavoring to raise himself, under the impression that the danger would come from beneath rather than from above; but although his effort was made immediately, it was too late to entirely save him from injury. Seats and passengers were crowded together and crushed by the death-dealing mass of wood and iron. The side of the penetrating car crushed Ehrman, who sat by Mr. Beard's side. On the opposite side, and just behind him, another unfortunate met his death, from a great beam of wood, which was hurled at him like a battering-ram of ancient time. Immediately in front of him and on a level with his head was the platform of the protruding car, bearing the horribly mutilated remains of the unfortunate brakesman, who hung upon its iron railing with disfigured countenance, both legs torn off and bowels protruding. Splinters, hats, iron bolts, pieces of cushion, clothing, torn flesh and great jets of warm blood flew over such of the survivors as were in the forward end of the car. The dying groaned and shrieked; those whose wounds were severe but not necessarily dangerous implored assistance, blasphemed or prayed forgiveness for their sins in their fright. Mr. Beard endeavored to extricate himself, but without success. His legs were tightly jammed among the *debris* of the wrecked cars, and for over an hour he was forced to remain in the company of the dead and dying, covered with the blood and brains of the mangled victims, before relieved. Strange to say, Mr. B. suffered no injury other than some severe bruises and contusion of the legs and a wrenching of the right foot.

The description given by this gentleman is vivid, and yet evidently the result of a calm and fair view of the situation. He speaks of the fearfully sudden transition from a sense of security and comfort to one of the wildest, most helpless confusion and devastation, as something beyond the power of man to describe with anything like distinctness. Death stared all in the face. No time was allowed for thought. When the accident occured, an instinctive, spasmodic effort at self-preservation was made by all; but, the immediate shock being over, the reality—in all its sober, sad, bloody details—forced itself upon the survivors. They were so hemmed in and confused by the ruins that they could know nothing of what more might be in store for them. The cars might take fire; another train might come in upon them through the fog and destroy the lives which had thus far been spared, and yet the survivors were powerless to aid themselves."

During the act of "telescoping" on this train, splinters of wood work, fragments of chains, iron and wood, filled the open space, and brought death or injury to several, who would otherwise have escaped. The appearance of this portion of the wreck, immediately after the collision, beggars description. Irregular fragments of iron and wood were thrown together in a confused mass, penning and holding in its midst human bodies, dead, dying, wounded and unhurt; while the cries of anguish, begging for help, which of necessity was slow to come, was a scene never to be forgotten by the eye-witnesses present. The scene here alluded to was confined to the open portion of the telescoped cars on the left. The end and extreme sides of the car were then unbroken, forming with the telescoped car a close room some six by eight feet in size, in which some twenty bodies, dead and alive, as above described, and the *debris*, as shown in the engraving, were jammed together in a confused and tightly-wedged mass. Against the rear wall, and near the corner next the observer, was the body of Judge Baldwin, pinned in nearly erect; from out the first window shown, hung a human head nearly severed from its trunk; across the hand rail of the platform of the emoking car which was telescoped into the passenger car, hung the dead body of the brakeman, who evidently died at his post, and was caught upon the rail before which he was standing, and in that position forced back through the partition of the car, and thus carried to near the farther end. The other bodies, living and dead, were wedged in as already described. There were no ladies in either of these cars.

Getting out the Dead and Wounded.

Of course, the first effort after the collision was to relieve the dying and wounded. Everything, animate and inanimate, was so firmly wedged and fastened in the mass, by the force of the shock, that the greatest efforts were required to liberate them; axes, hatchets, crowbars, levers, and jack-screws were required to perform that work, and it was fully an hour and a half before the last living body was removed. It is a marvel that any one in this car escaped with their lives. One fireman on each train was killed; also the engineer of the Western Pacific. The engineer of the Alameda train saved his life by jumping. Neither of the conductors were very seriously injured. With one or two exceptions, the deaths were all instantaneous, and but one, we believe, has died of wounds who was taken alive from the wreck. Immediately after the collision, the passengers and employés who escaped unhurt, proceeded to render every possible assistance in extricating the wounded. The ranchmen of the neighborhood, who heard the crash to the distance of full half a mile, also rushed to the scene, and did all they could to assist in extricating, and to relieve the sufferings of the wounded and mangled, after their liberation. Noble women were also there, who heroically or tenderly lent their aid, as the circumstances required.

The first thing done was to cut away the end and sides within which the mass of humanity already described was crowded. This was a very difficult and dangerous position and required much time. It seemed terribly slow to the sympathizing laborers, and doubly so to the poor sufferers within, to whom minutes seemed hours. The first person was not relieved until thirty-six minutes after the collision had occurred, care being first taken to put out the fires, so that the scenes of burning and roasting, as in a similar disaster in the Eastern States, might not be re-enacted here. Those last released remained in the wreck an hour and a half. As fast as the living were released they were taken to the uninjured cars and tenderly cared for. Medical assistance soon arrived from the neighboring towns and from this city. The dead were laid out in a ghastly row upon the wheat stubble, with paper or cloths covering their faces, and their heads resting upon cushions taken from the cars, until time and opportunity was had to more properly dispose of them.

The Killed.

Judge Alexander Baldwin, U. S. District Judge of Nevada; J. B. McDonald, Roadmaster of the Sacramento Valley Railroad; Prof. A. Boulet, Principal of Young Ladies' Seminary, Oakland; Chas. Martin, Fireman of Hayward train; Frank B. Milliken, Head Brakesman W. P. Railroad; Edward Anderson, Engineer of the W.P.R.R.; Geo. Thompson, Fireman W. P. Railroad; David Wand, dry goods dealer, San Francisco; James Conly, Corral station; Max Ehrman, Mission San José, Agent Bamber & Co.'s Express; B. H. Fox; H. Peterson, Corral Hollow; Thomas F. Sandoz, of this city. J. P. Lowell, of Sacramento, has since died of his wounds.

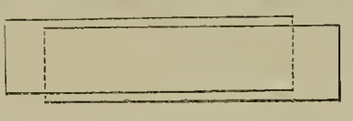
The Wounded.

Seth Bromley, Stockton Pilot; J. R. Heleus, San Francisco; James F. Capp, Amador Valley; Simon Meloche, San Francisco; Thomas McNulty, San Francisco; M. L. Taylor, DeKalb county, Ill.; G. Loighton, Rocklin, Placer county; Philip Ruly, Stockton; Noel Langton, employé; Patrick Mehon, San Francisco; E. F. Fitch, Consumnes; Joseph L. Perkins, employé; C. E. Needham, Banta Station; S. M. B. Haly, San Francisco. All the above were taken to Dr. Trenor's private hospital, near where the accident occurred. Judge William Campbell, of Nevada; Robert McLaughlin, brakesman; Robert Owens, conductor; J. L. Beard, Oakland; T. W. Finlayson, Washington Corners; Mr. Adams, Wells, Fargo & Co.'s Messenger; George Cadwalader, Sacramento; G. H. Downer, Sacramento; S. Buckley, Snelling's; two Chinamen were badly bruised.

A recapitulation of the above gives 14 dead and 25 wounded. The latter will probably reach to 30, as several were taken away by friends, whose names were not reported.

Telescoping.

In order to enable our readers to more fully understand the singular manner in which these cars were shoved in together or "telescoped," we append, in addition to the pictorial illustration, the following diagram, supposed to present the condition of the cars when seen from either end.



This diagram relates more particularly to those on the Western Pacific road. The underneath car, as shown in the engraving, sat firmly upon the track, while the roof of the upper car, torn from its flooring, shot over the roof of the lower one; the floor of the upper car, broken away from its truck, shot into the lower car, sweeping along for forty-two feet of its entire length of fifty feet, driving before it the passengers, seats, furniture, end walls, etc. The seats of both cars were dashed into confused heaps, and the wonder is that every person in them was not torn into shreds. As it was, but twelve men out of about thirty or more in the two cars were killed, although every one was more or less seriously hurt. The intruding ends of the cars were nearly all broken away, while the opposite ends of each remained nearly intact. The relative position of the sides of the cars is seen in the diagram. The roofs and the floors occupied the same relative positions to each other. Both trucks of the upper car were broken from their fastenings, and but for the force required to effect that, the telescoping would probably have been complete, in which case probably not a living body would have been taken from the under car. The telescoping in this case is said to have been the most complete of any occurrence of the kind known. The larger effect was probably due to the great weight of the silver palace cars, whose impetus could not be taken up, short of an almost complete demolition of the telescoping cars.

It has been a wonder with many, that the baggage and express cars, between those telescoped and the tender (the express car only being shown), were not crushed, rather than the passenger cars, as they had a greater weight in their rear, by the amount of that in the telescoped cars. An examination of the floor timbers of those cars affords an ample solution of the mystery—greater strength (for carrying heavy loads) and equal heights, which brought the timber heads directly against each other, endwise. These cars were, in all probability, also, heavier loaded than the passenger cars, which still further tended to prevent either from leaving the track, so as to "telescope." The great weight, heavy timbers, and general strength of a Pullman car, is said to be proof against telescoping; so also, we presume, of the new silver palace cars; while the light, frail-constructed, ordinary passenger car, yields readily to such action. A seat in such a car should always be avoided, when it is possible to secure the same in one more strongly constructed.

This was probably the squarest and most nearly matched railroad collision on record. The track was perfectly straight, so that the engines struck and "locked horns" squarely. The greater weight of the Western Pacific locomotive was about equally offset by the greater speed of the Alameda engine. The greater telescoping effect on the Western Pacific, as has already been stated, was due to the heavy palace cars in the rear of that train.

The Coroner's Verdict.

The verdict of the Coroner's jury, which was rendered on Thursday, attaches the entire blame to the "ignorance and incompetence" of the switch-tender at the "junction," who said to the engineer, "all right—go ahead." They further find that he deceived the officer of the company who employed him, with regard to his ability to read. As no warrant has been issued for his arrest, we presume the jury is of the opinion that "ignorance and incompetence" is no crime, even when a man deceives those from whom he seeks a position, involving the safety of human life; and even after it has been shown that such "ignorance and incompetence" has led to the destruction of more than half a score of human beings. It is certainly a little singular that, in the very face of a calamity, which has carried sorrow and mourning into so many families, and which has been caused by confessed incompetency, previously concealed, not even a word of condemnation is uttered against either the party himself or his employer. If "ignorance and incompetency" are not criminal of themselves, they certainly ought to be considered so, when thrust into positions, where life is endangered by their presence. There is no help for the past; but duty to the living seems to require that *something* should be done to prevent the recurrence of similar disasters.

Hose Test.—At a test of hose, by the officers of the Fire Department, on Saturday last, Mr. Fulton produced 2,400 feet, which was subjected to a test of 180 lbs—1,200 feet stood the test and 1,200 feet failed. Subsequently Messrs. Cook & Co. produced 1,100 feet, all of which stood the test. In general the tests and results were as follows: Five lengths, making 250 feet, were attached to the steamer and a "blind cap" was put on at the other end of the section. The first length burst at 121 lbs. pressure. The succeeding ones tried in its place burst at 80, 75, 125, 120, 125, 127½, 100, 122, 93, 112, 110, 125, 120, 125, 128, 120, 95, 110, 125, 120, 110, 120, 125, 120, 125, 105, 120, making in all twenty-seven lengths, measuring 1,350 feet.

Afterwards a section of five lengths, which stood the pressure of 130 pounds with a cap on was tried with a nozzle, one length burst at 180 pounds, another at 140 pounds, and a third at 160 pounds.

Arsenic in Carbonate and Sulphate of Soda.—Fresenius finds that arsenic is often present in carbonate of soda. A sample purchased as chemically pure, on being mixed with cyanide of potassium and heated in a stream of carbonic acid gas, gave distinct traces of an arsenic mirror. Five grammes dissolved in water and saturated with hydrochloric acid heated to 70° C. gave clear yellow flocculi with sulphuretted hydrogen. He traces the origin of this arsenic to the sulphuric acid employed in its manufacture, the greater portion of which is now made from arsenical iron pyrites. Specimens of sulphate of soda in the form of crude salt cake also showed traces of arsenic.

Dr. Hagan himself has started up and is engaged in operating one of his roasting furnaces in Colorado.

Nine ton of California slate, of excellent quality, were shipped through Stockton to San Francisco on Thursday, Nov. 4th.

A ledge of coal has been discovered on Pitt river, some distance from Fort Crook.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, November 19, 1869.

Financial.

Money is not scarce in San Francisco, but it is difficult of access to all but first class borrowers. Those who fail to offer the best securities are apt to receive the "cold shoulder;" but for legitimate business transactions, merchants in good standing find ample accommodation at 1¼ per cent. per month. The drafts upon our savings and loan institutions are heavier than the deposits, and their ability to furnish the needful is correspondingly restricted, but we learn of no stringency or distress in any quarter. The Mint is actively engaged, and will probably furnish about $2,000,000 to the market during the current month. The removal of the Mexican export duties on treasure has already eventuated in a remittance of 70 tons of silver from that country, and is likely to bring us large additions. Bullion has been in fair supply during the week, and as our exports of treasure have been small, there is reason to believe that the money market will experience increased relief. An active and growing trade with the interior has been carried on with profit, and early returns may be reasonably expected. Grain bills must also soon add their influence to materially improve our financial status. The mines are yielding handsomely, and no more propitious weather than the State has been blessed with so far could have been desired. We find no cause to retract the opinion expressed in our last issue relative to the alleged scarcity of money. The lack of confidence, rather than the lack of means, was, in our opinion, the leading feature of our late stringency. It is gratifying to know that this is gradually disappearing. Gold bars range from 869 to 870, and silver bars sell at par. Currency bills on Atlantic cities pay a premium on gold of 25 per cent.; sight drafts, payable in coin, are effected at 1@1¼ per cent. premium; telegraphic transfers, 1½@1¾ per cent. premium; sterling exchange, 48¾d; commercial exchange 49½d; Mexican dollars command 5 per cent. premium; legal tenders, 78⅝@79¼.

The duties paid at the Custom House in this city from November 11th to date have been as follows:

November 11	$99,321 12
November 12	41,164 35
November 13	15,459 29
November 15	19,223 07
November 16	26,632 88
November 17	23,094 36
Previously in November	216,918 98
In November to date	$371,813 99
In October	830,257 95
In September	887,823 95
In August	769,589 56
In July	942,814 71
In June	674,051 81
In May	595,030 24
In April	554,882 05
In March	730,447 40
In February	692,340 00
In January	532,987 97
Total since January 1st, 1869	$7,543,049 63
Corresponding period, 1868	7,672,939 80
Decrease this year	$129,890 17

The exports of Treasure from Nov. 1st to date have been as follows:

Nov. 4—Per America—		
To China	$1,164,338 35	
To Japan	2,000 00	
		$1,166,338 85
Nov. 1 to 4—Overland to New York		22,000 00
Nov. 5 to 11—Overland to New York		209,815 08
Nov. 17—Per Golden City—		
To England	$350,514 41	
To France	55,559 82	
To Central America	10,000 00	
To Panama	20,000 00	
		536,074 23
Nov. 12 to 18—Overland to New York		45,000 00
Total since November 1st, 1869		$1,977,268 16
Previously this year		32,531,657 85
Total since January 1st, 1869		$34,508,886 01
Corresponding period, 1868		31,948,657 03
Increase this year		$2,560,228 98

The feasibility of resuming specie payments, or placing our financial dealings on a specie basis, is just now occupying a very large share of public attention, as it is the key to the elucidation of a thousand embarrassing questions of national importance. At no time since 1861 has the condition of the country been so favorable for getting rid of the yoke which binds all classes, unsettles all values, disturbs all business transactions, and plays with our national credit as if it were a fit subject for gambling. At the close of October the Government Treasury contained $62,000,000 surplus gold. The November sales of gold will be returned for customs almost as fast as got rid of, while the New York city banks held, at the date specified, $21,926,946 in coin, being much larger than the average hold of the same banks during the hard-money times before the war. In the meantime, the South has been accumulating large hoards of specie, paid for their domestic produce, and retained from want of banking accommodations.

The amount realized from sales of cotton in 1868 was $153,000,000, and it is estimated that the cotton exports for 1870 will reach $200,000,000. Planters have determined to receive nothing but gold for their products, having suffered too much from the fluctuations of paper currency. One never knows how much he may expect per pound for cotton sold to northern purchasers. A sudden freak of gold gamblers may depreciate the price two or three cents the pound; but for all that he sells abroad payment is had in coin. The system of advances upon crops, formerly in vogue between Northern capitalists and southern planters, exists no more. The crops of 1869 have been produced without extraneous aid, and planters are out of debt. It is clear that the South is in a better condition to place its business on a specie basis than is the North. Not so with the West, where many farmers are considerably involved. Were Wall Street operators deprived of the possibility of speculating in gold, which would be the legitimate result of resuming specie payments, millions of dollars in coin would flow into regular business channels, and gold would lose its fictitious value because paper would then be the true representative of gold, instead of the lever by which it is now depressed or raised, at the option of a clique. There can be no doubt that resumption is the one great need of the country, and is eagerly desired by all classes of the community, except financial speculators, whose chief wish is to procure inflation of the currency. Of course, nothing tangible can be done without Congress. Mr. Boutwell can make preliminary arrangements for resumption—can pave the way, and enter into an understanding with foreign capitalists for the loan of certain sums, but his views must be laid before the National Legislature for its consideration and approval, or rejection. Our financial status is far better now than it has been for nearly ten years; the productive capacity of the country is larger, more flourishing than ever, and shows a steadily increasing volume in home and foreign transactions. We are persuaded that many of the objections urged against resumption are either mere bug-bears, or are advanced in the interest of speculators. The policy pursued by Mr. Boutwell does not warrant the belief that he would take any important step with precipitate haste, without mature consideration, and on minute information as he can procure. Should the Government determine to rid the nation of its most galling yoke, we feel satisfied that it will be done with suitable precaution. Sufficient time and wide-spread notification will enable any one to prepare for the change. When the announcement shall come that Government will resume specie payments at a given date, it will be found that very few will demand coin for their paper, simply because that paper will be as valuable as coin. It will be found that there has been a great tempest in a tea-pot—a vast mountain struggling to produce a mouse. That the Government meditates an early resumption is scarcely subject for doubt. The thing can be done, and the country is in the best condition to accept the change. Every interest will receive a beneficent impulse, and all values will be definitely settled, involving the clearing away of much that is now dark and tangled.

City Stocks.

The public dealings in miscellaneous securities have been quite restricted for some time past.——During the past week we note the sale of a few shares of Spring Valley Water Company's stock at $62 87½@62 50.——The Black Diamond Coal Company has declared its first dividend of ⅝ per cent. on their capital stock of $5,000,000, amounting to $25,000 in the aggregate.

Mining Share Market.

During the period under review the mining share market has shown considerable activity, the recent advance of leading stocks continuing to be well maintained. The large sales of these stocks indicate a firm condition of the market, and with the important developments in the Hale & Norcross claim, as detailed below, the market is likely to continue firm for some time to come. The benefits to be derived from the Truckee railroad, now completed, will also greatly enhance the value of the Comstock claims.

HALE & NORCROSS—took a rapid upward stride upon the late rich discoveries on the sixth level. Mail dates to the 15th inst., state that cross-cut No. 2 had been carried through the deposit, showing a body of ore 27 feet wide, and that cross-cut No. 3 had already penetrated the ledge upward of 40 feet, without reaching the west wall—all in good ore, the face of the latter drift at this date—says the Superintendent—showing better ore than he had ever seen in the mine. Cross-cut No. 1 is in the vein some 12 feet, the face of the drift exhibiting excellent ore. Now the distance from cross-cut No. 1 to No. 3 is 115 feet, which gives a deposit of ore of that length that is 12 feet wide immediately beyond the shaft, and gradually expanding until it has gained a width of more than 40 feet without reaching the other wall. This, certainly, is one of the most important developments made within a long period. For the week ending November 13th the following ore statement is made: Upper mine—175 level, 124 tons; 300 level, 251½; 500 level, 321. Lower mine—3d station, 322¾; 5th station, 299¾, showing a total yield of 1030½ tons. They have on hand 2860 tons.

CHOLLAR-POTOSI—sold to a much less extent than last week. The ore extracted during the week ending Nov. 12th amounted to 874 tons, against 845 tons the previous week. We learn of no change of great importance since our last report. The quality of ore recently extracted is somewhat better. On the 16th inst., $21,526 in bullion was sent forward to the office of the company in this city.

KENTUCK—has again attained a high position in the stock market, sales having been more numerous at greatly improved prices. A dividend of $10 per share is payable since the 19th inst. The annual meeting takes place on the 24th inst. We expect to present a very interesting report of this company for the past fiscal year in our next issue.——IMPERIAL has declined. An assessment of $10 per share was levied on the 15th inst.

SIERRA NEVADA—sold to a larger extent than usual, but at a recession from prices obtained during last week. Work in the winze from the lower drift, at a depth of 43 feet, was retarded on account of the flow of water. They have started a drift from the old tunnel to intersect this winze, which will drain the water and allow them to prospect in virgin ground.——OVERMAN is inactive. "The sill floor of the 226 level continues to widen as we go south. The quality of the ore is much better than last week. The cross-cut west from the fourth floor, after passing through three feet of clay, is in ore 15 feet, and not through it yet. Amount of ore extracted during the week, 910 tons; average ear assays, $47 60; amount of ore shipped to mills, 859 tons. The raise in the 500 east is up 26 feet in more than average ore."

LUCK.—The Duke of Edinburg, while in Australia, was induced to invest in a claim which he visited, and which has since proved wonderfully rich, having turned out in one day 2,093 ounces of gold from 550 pounds of quartz, and on another day 2,036 ounces from 460 pounds; the appearance of the rock being described as "a perfect wall of gold."

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Nov. 19, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton.
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

These prices, corrected by W. T. Atwood, we believe will be found substantially correct, and can be realized at this date.

SPORTS OF VULCAN AND PLUTO.—A lava flow just reported by telegraph, near Papayan, New Grenada, has buried two or three villages and destroyed many lives. Soon after the eruption, the river rose to quite a height, and quantities of lava were floated by, thickly strewn with dead bodies. The next day the river was quite dry.

THE death of Judge Baldwin in the railroad massacre of Alameda elicits an expression of sorrow which is universal. Railroad men concerned will not flee the country; but our judges are backed by a public opinion to do justice to the switchman.

FOUNDRYMEN will notice in advertising columns reduction in price of coke at the Gas Works.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Lively Times.—*Miner*, Nov. 6th: The late strike in the M. C. Tunnel No. 3 and proof positive that it is a continuation of the Tarshish ore deposit, together with the forward movement by the Tarsbish Co. on their mine, has given an impetus to business in Monitor, and all goes lively.

Globe.—Another cave occurred in this tunnel some days since, and the Supt. is cutting a drift to the left to penetrate the lode at right angles. Water is coming in, and it is thought the long sought is at hand.

Ore from the M. C. M. Tunnel No. 3 is to be crushed and sent to Dall's mill, in order to determine the best mode of reduction.

AMADOR COUNTY.

Keystone.—*Ledger*, 13th: The American Co. at Amador City are enlarging their mill by adding 20 stamps, which will give them 40 in all. New boilers and other machinery will also be added. At present, with 20 stamps, they are taking from $25,000 to $30,000 per month.

Summit Mine.—We are informed by Mr. Tibbits, Supt., that they have struck in the 400-foot level, ore that will pay $100 to the ton. The ledge is one foot wide, and increasing.

Chlorination.—The newly-erected chlorination works at Sutter Creek, are in full operation, and work successfully. We saw a gold brick Sunday, from sulphurets taken from the Eureka mine.

BUTTE COUNTY.

Mining.—*Record*, 13th: The storm has compelled river operations to close.

CALAVERAS COUNTY.

Railroad Flat.—Cor. of *Chronicle*, 13th: Glencoe District.—Barney & Co. have just finished crushing their last lot of rock with a gross yield of $43 per ton; expenses of mining, hauling and crushing, $10 per ton. The Hilaria Co. have worked a lot of 40 tons, at the Vance mill, yielding $30 per ton, with an abundance of the same ore in sight. The Lewis Bros. are working what they call the "little vein." The only crushing made from this mine was a lot of 40 tons, in two parcels, first and second class, nearly equal in quantities. The first yielded $214 per ton, and the second $46! Since working the first lot they have been constantly taking out ore equally rich. The large vein alluded to as Lewis' first discovery, has been sold to Mr. Gasbwiler for $30,000. The main shaft, 64 feet in depth, with a 40-foot level at the bottom, shows a 3-foot vein of first-class rock, some of it rivaling the Palomo specimens. The south extension is owned by Sheldon, Folsom & Co., who are sinking a shaft. At the time of my visit they were down 30 feet, vein large, and prospects good.

Railroad District.—In placer mining, W. V. Clark, with a ditch 26 miles long, and miles of hydraulic pipe, is doing more to enrich the State than any other individual I know of. The quartz mines rank second to none. The Petticoat has, by actual measurement, 300 feet of quartz in the level on the vein from the bottom of the 200-ft. shaft. The level in one of its swells reaches a width of 14 feet; its average is three. In the head of the level the vein is solid five feet, and prospects $20 a ton. A heavier engine is to be purchased.

LOS ANGELES COUNTY.

Gold Discovered.—A Los Angeles telegram of the 10th is as follows: Gold-bearing quartz has been discovered at the head of the Placerito, 40 miles northeast of Los Angeles, by a Spaniard named Dolores Cordosa. The surface rock abounds with free gold. The region has never been worked. An assay will soon be made. Our entire lower country is being prospected by old miners, and rumors of great discoveries fill the air.

NEVADA COUNTY.

Eureka Mine.—Grass Valley *Union*, 10th: Yesterday the shaft was completed, and the miners celebrated the event. There was plenty of music, speaking and beer. To-morrow the Eureka will have its full complement of bands in all departments.

Empire.—We were favored yesterday with a sight of some of the specimens from the Rush & Laton ground, south of the main shaft. These were literally covered with gold, the heavy sheets of which ran through the rock from one side to the other. The ledge is about fifteen inches in thickness and shows well in gold and sulphurets wherever it has been uncovered. In the main shaft, in the 8th and 9th levels, the ledge is three feet, and gives out splendid rock.

Joe Perrin's Mine.—Same of 11th: The yield for the last month was $11,200 and the total expense was $2,058, making a dividend of $9,143. The ledge looks better the deeper it is worked. The rock can now be taken out much more rapidly than it can be crushed, and the miners are some six hundred loads ahead of the mill.

Good Ledge.—The Idaho Co. have three feet of a ledge between the fifth and sixth levels.

Hydraulics.—Same of 14th: The Brown Brothers, on Squirrel Creek, who own the best hydraulic diggings in the township, are preparing to make an extensive run as soon as the water comes. They have a large extent of untouched ground.

Omega and Diamond Creek.—*Transcript*, 10th: At both places, in quartz and gravel, the claims are being fitted up for extensive operations. A new boiler is being put in the Salatbiel mill, and the battery is increased to ten stamps. In this mine they have a large ledge, which is very rich. The hydraulic claims are being made ready for water.

Purchase of Claims.—*Gazette*, 11th: The Little York Water & Mining Co. have purchased the claims of Timmons and Pattinson, of Little York, and the balance of the Pattinson ditch for $14,000. This will give the company nearly all the mining ground around Little York and Liberty Hill. They have just finished enlarging the Pattinson and Maguire ditch at a cost of $5,000, They will use 2,000 inches of water the coming season. They have 10,000 feet of iron pipe carrying water to five sets of claims. The company have five of Craig's globe nozzles with a capacity of 400 inches each. They employ 20 men. The gross receipts last season from three sets of claims were $70,000.

New Quartz Mill.—The mortar for the new mill of the Vigilant Co. arrived on Tuesday, and has been put in place. The works will probably be started up to-day, but the machinery will not be ready for regular work before Monday. The mill is constructed on a new principle, the steam acting directly on the stamps, of which there are but two. The company have out a considerable quantity of rock, and the ledge being of good size, the mill can be kept supplied.

Big Blast.—On Tuesday, 175 pounds of powder were exploded at a single blast in the claims of Marselus & Maltman. The shock was felt a mile from the claims. The earthquake was the common talk the next morning, as it was not generally known that a big blast was to be exploded. From appearances the blast did better execution than usual—the surface of the ground being cracked in every direction, and for some distance.

Note.—"Rambler" sends some notes to the *Gazette*, among which are these: In the Grass Valley Consolidated, during the past six weeks, men working on shares, took out 60 loads of rock, which paid over $20 a ton. The Greenhorn mine is in a remarkable state of activity. The house is finished, and the mill will be ready to start the 1st of December. Union Hill is looking well. The lode in the shaft and in the drifts east, has greatly improved. The machinery and shaft work are in excellent order. George Batters Co. has commenced operations. The mine is one-fourth of a mile west of Union Hill. The property consists of 2,500 feet, divided into 25 shares, owned principally by working men.

Meadow Lake.—A Sierra Valley correspondent of the mines of the Downieville *Messenger* writes, Nov. 6th: "The rose-colored account of the mines at Meadow Lake, proves a baseless story. Parties have arrived in the Valley, bringing doors, windows and house-furniture, and declaring that all the processes have failed to get any gold in paying quantities from the rock. After four years' time and the expenditure of many thousands of dollars, the most tenacious prospector now is satisfied that there is no gold there, The once populous town of Meadow Lake will be entirely deserted this winter. S. P. Whipple, for some time owner of Fordycc Valley near the Lake, has sold to a stock man, and starts soon for his early home in Michigan."

PLUMAS COUNTY.

Snake Lake.—Cor. of Quincy *National*. Nov. 6th: W. H. Smith, prospecting in the Wahponsee creek, struck pay grit that has shelled out an ounce per day. It had been prospected all around, but the spot with the good pay in it was left for a stranger. Richards & Jenkins, below Smith, are bringing up an open cut to their claims, with good prospects as they go along—heavy gold. Jenkins & Co., on the hill, are drifting to the back channel, with excellent prospects. Metcalf & Haycock have their large reservoir finished, and filling for a test of their gravel bank. Lile Jacks is cleaning bedrock, with good results. John Colman, on the head of Pine Leaf, is ready, and waiting for water. He has excellent prospects. McCarger & Sharkley have good prospects of striking the blue gravel deposit on Quiou Sabe Ravine. They have sunk a shaft 25 feet deep, and struck blue gravel; but it pitched so fast into the water that they had to abandon it until they can reorganize with a larger force, to work night and day. Better prospects for lasting diggings I have not seen. All the miners are ready and waiting for the rains.

SAN DIEGO COUNTY.

Strike.—A telegram of the 10th says: San Diego is excited over the reported discovery of rich gold mines 60 miles from that town. Quantities of dust and lumps of gold worth $10 are brought in. The precise location is kept as secret as possible. Parties are leaving here for the new diggings.

SHASTA COUNTY.

Sold.—*Courier*, 13th: The Clear Creek ditch was sold at Sheriff's sale a few days ago for $3,000. The same property, in times past, figured on the assessment roll of the county at a valuation of $75,000.

SIERRA COUNTY.

Quartz.—*Messenger*, 13th: Ned Leonard has been running his quartz mill for a week, and the prospects are very flattering, considerable gold having been taken from the plates in front of the battery.

TUOLUMNE COUNTY.

Confidence Mine.—Sonora *Democrat*, 13th: The clean-up last week yielded $3,000. The owners are so well satisfied with the prospects that they are adding ten stamps to the mill, which will increase its capacity to thirty.

Half Gold.—We were shown this week some specimens of gold-bearing quartz out of a claim near Jamestown, which were fully half gold. The claim belongs to Lewis Male, who works it by himself.

Columbia.—Cor. Stockton *Independent*, 13th: Lew Alvison and J. B. Bacon, of Sonora, have struck rich pay dirt in their claim, in the mountains across the Stanislaus, half way between Columbia and Vallecito. They have been nearly a year running a tunnel. The pay dirt is four feet deep. Out of five cart loads (30 buckets each) they realized $160. They have found several coarse pieces of gold; one weighed $45.

The Haynes Bros. struck it very rich in their claim at Parson's Ranch, just as the water in the ditch failed. When the water comes they will take out large sums.

Arizona.

Wickenburg.—Prescott *Miner*, Oct. 30: D. Henderson returned from Wickenburg on the 28th. From him we learn that the Vulture Co's 40-stamp mill was crushing 80 tons of ore every 24 hours. The ore was paying nearly $40 per ton in free gold.

Big Bug.—The mill is now idle. It will be started up some time next week. Nearly 30 men are taking out ore, chopping wood, etc.

Sterling.—Mr. Garretsee yesterday informed us that he is ready to start the mill whenever water comes.

R. W. Groom and Geo. Monroe left for Wickenburg last week, to start work on the White Picacho mine.

Another Ditch.—Jos. W. Knott and a Mr. O'Toole are making a ditch to convey water from Granite creek to the creek banks on Dr. Moeller's ranch, where, from prospects already found, they hope to get good pay.

Colorado.

Montezuma.—Central City *Register*, Nov. 4th: The St. Lawrence Co. has its mill and smelting works completed. Mr. Collom has been running his new patent roasting furnace, with its mechanical rakes for stirring the ore. It worked satisfactorily. Taylor & Allen have drifted 25 feet on the Register lode. As a whole, mining has a cheerful look.

Struck It.—Reed & Morse, who have been working the Sanderson claim on the Bates-Hunter, have struck a body of splendid ore two feet in width, in the west drift.

Krom.—Jacob's Krom concentrator is reported to be doing well on silver ores. Twelve tons, yielding an average of $54 per ton, were so concentrated as to yield from $200 to $500.

Lake District.—*Herald:* The Williams lode, the surface quartz from which was very rich in gold, is now yielding very rich ore. The vein of solid mineral is about six inches wide, and assays 150 ounces silver and 1½ ounces gold per ton. It is a gray copper. Mr. Jones is working his claim on this lode.

Henry Paul has discovered a vein of silver ore, which proves to be very rich. He has named it the Bonanza.

Clear Creek.—Bennett, Wright & Co. have been working on Grass Valley Bar since the latter part of August without raising a color until a few days ago. Since the late storms they have been taking out $10 a day to the man.

The Terrific lode, Virginia Cañon, promises big. The ore vein is two feet wide, and assays $35 in gold and $53 in silver. The shaft is 15 feet deep.

Nevada District.—Potter & Hawley are running 15 stamps for Sabin, on ore from the Forks lode, which yields from seven to eight ounces of gold to the cord. Whitcomb's mill is also at work on rock from this lead.....Beverly keeps 15 stamps on Missouri ore. The Prize lode supplies Clayton's 12-stamper, and furnishes ore for George Kimball's mill in Black Hawk. B. C. Waterman is running his mill near Eureka gulch, on rock from the Gardner mine, and is getting the Kansas-Colorado mill in order.....The lease of Andrews & Sullivan, on the Jones lode, having expired, Phillips has taken possession and is working it. The yield at one time reached 32 ounces per cord.....Winders & Martin are working claim No. 6 on the Missouri lode. They have reached a depth of 180 feet, and have a fine crevice of five to six feet. Eighteen stamps of Woodbury & Norton's mill are crushing ore from their claim. Douglas & Dougberty are working claims 7 and 8 on the same lead. We are told that 80 stamps in Black Hawk are running on California quartz. The Ophir claim, Burroughs lode, is being worked by the men lately employed by the company. They are taking out ore which runs seven ounces.....The Hardy brothers are putting up a mill....The Chicago mill, which had been running on quartz from the Prize lode, starts up again to-day on ore from the same lead.

Mining Items.—Georgetown *Miner*, Nov. 4th: Specimens from the new strike in the Baker mine assay $960 in silver to the ton.....Conqueror is yielding $200 to the cord in gold....Last week at the Morris tunnel, Columbia Mountain, they passed through a lode four feet in width, carrying a narrow vein of sulphuret of silver....Whale lode at Spanish Bar yields largely....Wide Awake, Bruno Mountain, has a vein from four to twelve inches in width, of fine grained galena, carrying $130 in silver to the ton....Peter Smith says the Comet has a crevice 60 feet wide.....Highland lode is yielding first-class ore....On Monday we saw a mass of brittle silver from the Equator 1¼ inch long and ditto thick....Anglo-Norman lode on Columbia Mountain, assays $250 per ton.....L. Huepeden & Co. will commence crushing with their new machinery in a day or two....The dressing works of the Wilson & Cass Co. will commence operations soon....Rich strike in the Caledonia.....Baltimore tunnel stopped sinking to lay track. The vein is 18 inches....."Monster," on Republican Mountain, near the Par lode, promises to be first class.

Rich Strike in the Brown.—An assay of the selected ore made by Professor Cheever, gave a yield of $13,197.92 in coin per ton of 2,000 pounds. The rich ore is pronounced by our best judges and experts to be a new mineral. We acknowledge the receipt of a specimen weighing 15 pounds.

Bullion.—The total for the month is 17,163.26 ounces, coin value, $20,583.43, against $24,358.32 for September, a decrease of $3,774.89, owing to Stewart's being shut down for the past three weeks, and delays for necessary repairs at L. Huepeden & Co's works.

Republican Mountain.—Snowdrift is yielding large quantities of very rich ore, and depth is being rapidly gained in several shafts. At Sterling we saw 13 sacks of ore that will yield $1,000 per ton. The Sunburst has a 5-foot crevice and shaft 25 feet deep.

Cascade Lode.—This is on Sherman Mountain. The shaft is 45 feet deep; crevice four feet wide. Twenty-two hundred pounds of well-selected ore have been treated by Huepeden & Co., which gave a yield of $200 coin value per ton.

Idaho.

The Poorman.—*Wave*, 11th: Further developments confirm the opinion that this is a true fissure ledge, with solid wall casings and a sound vein of rich mineral. The transition from a broken up mass of rich quartz, mingled with granite found in bunches at intervals, to a solid, well-defined ledge, takes place at a depth of 450 feet, at which point there appears to have been at some period a breaking off and slipping

past each other of the two edges of the vein for a distance of nearly 70 feet, north and south, along the course of the vein.

KEYSTONE.—Capt. Myrick, of Portland, has purchased the interest of Mr. Firebaugh in the Keystone in Long Gulch. It now belongs to Myrick and Sayre, who have let a contract to sink a certain depth.

BAXTER.—Billy Hammond showed us a square block of ore from the Baxter mine on Thursday, taken that day from the bottom of the shaft, 260 feet from the surface. The piece is about a foot in length by four or five inches broad and say three in thickness. One side is completely covered with the brightest ruby and native silver—the other plastered over with chlorides just as it was taken from the mine.

LOON CREEK.—The *New Northwest* says: "Mr. John Perry, of Pioneer, just returned from the Loon Creek mines, reports great disgust, and says many are leaving the camp; houses are left half-finished, and crammed full of goods at low figures. Oregon flour was selling at $18 per hundred, having fallen $4 during the time he was there. The weather was extremely cold, and little work was doing."

Montana.

A DITCH ENTERPRISE.—Helena *Gazette*, Oct. 28th: Mr. Griffith is engaged by Mr. Marshall to survey a ditch from Trout Creek to the foothills. It will be 20 miles long, and will cost $35,000 or $40,000.

DIAMOND CITY.—Editorial correspondence of same: I saw in Confederate, last week, 22 ozs. of fine gold, from one and one half set of timbers in the main gulch. The prospects all along the gulch are satisfactory, and ou Boulder bar, opposite Diamond City, first rate. The gold is coarse. Some interest is taken in Gravelly Range, which is being prospected with energy.

RADERSBURG.—I found the Keating lode developed 1,600 feet in length, with a crevice all the way of from three to five feet; one shaft 96 feet deep, and the lode only ten feet from a perpendicular in that depth. I found Mr. Keating retorting a clean up of rock promiscuously taken, which resulted in a fraction of over $35 to the ton. $41, $45, and as high as $200, have been taken from the ton of rock out of this lode.

The Robert Lee is considered even richer than the Keating. It has a crevice three and a half feet thick; is well defined, and has been penetrated to the depth of 40 feet.

The Bully Boy is a rich lode, with a crevice four feet thick, and prospects satisfactorily.

The Leviathan has a crevice four feet thick; has a shaft 90 feet deep, and prospects average $60 to the ton.

The Ohio lode is rich, but owing to a want of scientific knowledge cannot now be worked. $60 to the ton has been procured from this rock.

They know the value of the quartz here, and will work it on arastras until able to build mills. I saw a retort of 80 oz. of beautiful gold cleaned up from Mr. Blacker's arastras from 20 tons. The quartz in the Keating is so much decomposed that it washes almost as easily as earth, and it is very profitably worked in arastras.

DIAMOND CITY.—Same of Nov. 4th: Prospects are improving. Several claims are taking out good pay.

PHILIPSBURGH.—Correspondence of the *New Northwest*, Nov. 5th: Progress has been reported in the matter of leasing the St. Louis & Mountain Mining Co's mill. We believe terms have been agreed upon and the mill is to be put in running order immediately. A competent amalgamator has arrived.

The Cole, Sanders & How Co., are progressing with the erection of their new separator, rapidly. Professor New assures us that if successful with the experiment, the machinery will be increased to one hundred tons capacity per day. Their mine, the Speckled Trout, shows a heavy body of quartz, rich in mineral. A shaft is now being sunk on No. 3. Work has been resumed on the Mountain Queen shaft, one hundred feet from the surface in the first level. The tunnel upon No. 3, Comanche extension, will soon be reopened, and discovery claims also worked for ores to supply the demand upon the commencement of operations in the mill. Nearly one thousand tons already await the whistle call.

IN PROGRESS.—Work is commenced on the Race Track ditch, leading to Prairie gulch. Thirty men will be at work next Monday. In thirty days of moderate weather, the flume bed—2¼ miles long—can be built.

Nevada.

COPE DISTRICT.

SUNNY HILL MINE.—Elko *Independent*, 10th: Reports have reached us that the Sunny Hill mine is developing beyond all expectation in richness. The shaft is disclosing large bodies of ore of the very choicest character.

ARGENTA.—An Elko telegram of Nov. 10th says: Another shipment of 12,000 pounds of ore from the Argenta mine was received here yesterday, to be shipped to San Francisco to-day.

Another of 12th: The new mill for Cope arrived here to-day from San Francisco.

The *Enterprise* of 12th has seen a letter from Carl York, the musician, now at Cope, who says it is the richest mining district on the coast. The letter contained a specimen of placer gold.

HUMBOLDT.

ALASKA MINE.—*Register*, 6th: In 1863 the Croesus was a rich specimen gold ledge. Much money was spent to no purpose in running tunnels and sinking shafts. Messrs. White & Wentworth still, however, had faith, and recently sunk a shaft in the place where they thought there ought to be a mine, not far from the old Croesus location. The result was a 20-inch vein near the surface. They are now 30 ft. down, and the ore assays $150 in silver and $750 in gold. It is called the Alaska mine.

REESE RIVER.

FINE YIELD.—*Reveille*, 11th: We saw this afternoon a certificate of assay of the pulp of 20 tons of ore from the dump of the El Dorado South, in the district of Silver Bend, the yield of which was at the rate of $192.47 per ton. The El Dorado is a true fissure vein of immense size, and is loaded with ore of a superior grade.

RAILROAD ORES.—The ores of the Railroad district are mainly copper of a high grade; but we saw a lot to-day in which silver existed, as shown by assay, all the way from $30 to $50 a ton.

EUREKA DISTRICT.—Carlin telegram of 12th: W. W. Coy shipped yesterday, from the Eureka district, 128 bars of bullion, weighing 15,000 pounds, valued at $5,000. The bullion was consigned to T. H. Selby & Co., of San Francisco.

THE STETEFELDT FURNACE.—The chloridizing works at Reno are a success. The *Reveille* says: "We predict that this furnace will produce a revolution in the silver-producing regions. The short campaign at the mill at Reno has given a value to hundreds of mines in this State alone. In such districts as Bunker Hill, Silver Bend, Cortez, Columbus and others, where there are large bodies of ore of a low grade, the advantage of the Stetefeldt furnace is simply inestimable. By its use, worthless ores, by thousands of tons, may be utilized and their precious metals reclaimed."

WASHOE.

OPHIR.—*Enterprise*, 14th: The water stands some 250 or 300 feet high in the main shaft and no attempt is at present being made to drain it. Machinists are at work upon the new engine, which will be in running order this week, when a new hoisting tank will be set in motion. The water will doubtless soon be drained and drifting resumed.

HALE & NORCROSS are cross-cutting on their sixth level, 50 feet north of their shaft, also at a point 65 feet further north. Both cuts are in the ore vein, and neither has yet reached the west wall. The ore in both is very rich.

YELLOW JACKET.—The connection between the old and new works was completed Wednesday. To-morrow they will hoist from the south shaft 200 tons, and expect to continue to hoist that amount daily. About 90 tons per day will be taken from the north shaft, and that amount will be shipped on Tuesday next and daily thereafter by railroad to the mill on Carson river.

OCCIDENTAL.—This mine is looking fine. The body of ore in the north end continues to improve. The usual amount of ore is being taken out for milling.

SEGREGATED BELCHER.—Good bodies of ore are being found on the 400 and 500-foot levels. A winze is being sunk on the 230-foot level.

IMPERIAL-EMPIRE.—Drifting is going on from the 1,000-ft. level. They are still sinking upon their main shaft, which is down 80 feet below the 1,100-foot level.

VIRGINIA CONSOLIDATED.—The shaft is down 410 feet. The rock is becoming softer. The water gives but little trouble.

SUTRO TUNNEL.—The small tunnel, or heading, six feet square, was yesterday in 131 feet, and the main tunnel 43 feet, substantially timbered as work advances.

TWIN.—The mine is yielding 15 tons of ore per day, which pays from $25 to $30 per ton, nearly all gold. A good body of ore has been developed on the 400-foot level.

CALEDONIA.—The new shaft is down 100 feet, is timbered, and a drift has been started for the purpose of opening the first level. The railroad runs within a few rods of the shaft.

MONTE-CHRISTO.—This mine has been reopened, and ore is being crushed from it at Adam's 5-stamp water mill on Six-mile Cañon.

KENTUCK.—The company are taking out 150 tons of ore per day from the 700, the 800 and the 900-foot levels, and from the old west ledge.

CROWN POINT.—The east drift from the 1,100-foot level is in 400 feet, and is in a hard black porphyry.

OVERMAN.—The company are taking out 140 tons per day of good milling ore, with good prospects ahead.

BELCHER.—We understand that pay ore is being hoisted from this mine. Drifting for new deposits is still going on.

SAVAGE.—About the usual amount per day is being taken out. Drifting still going on.

LADY BRYAN.—The mine is looking well, and the mill is kept in constant operation upon fine ore.

SIERRA NEVADA.—The surface has been extensively drifted upon and proves to be immense.

WORK TO BE RESUMED.—We are informed that work is to be resumed on the old ground, high up on the mountain west of the city, known as La Miner de L'Alto.

SIERRA NEVADA.—Gold Hill *News*, 13th: The rich vein of white ore ten feet wide, has been drifted out 65 feet. Water was encountered night before last which may perhaps give trouble. The mill is constantly at work.

WHITE PINE.

WEEKLY MINING REVIEW.—*Empire*, 14th: "We have no important changes to note in the condition of our mines. All of them continue to yield well, and the supply of ore at the mills has steadily increased. With another month's fair weather, most of the mills will be stocked with an abundance of ore to keep them in constant operation, even though we should be visited with protracted storms during the winter. One or two sales have been consummated at the East during the week, and negotiations for several others are pending. The feeling in White Pine stocks in all quarters appears more favorable than for months past."

The *News* says: "No better inducement has ever occurred for investment in our mines than this winter offers. Men who are unable, financially, to open mines, are willing to sell at reasonable figures, and capital, directed by intelligent minds, is taking advantage of circumstances."

QUARTERLY RETURNS TO SEPT 30.—*Empire* gives a list of mines which have bad ore milled during the quarter, with the amount and value of each. The totals are: Tons, 10,323; value, $605,192.

BULLION FOR THE WEEK.—*Empire* of 19th says: Several circumstances have conspired to reduce our bullion shipments for the week. The Nevada mill (McCone & Dunn's) has been out of service pending the change from dry to wet crushing, and the bullion robbery at the Stanford mill has prevented returns from that quarter. A larger amount of silver than usual is also lying in pulp. Hence our exports of bullion for the week aggregate only $46,825.58. The *News* of 12th makes it $32,632.

MILLS AND FURNACES IN EMPIRE.—The capacity of the Smelting Works at Shermantown is to be increased at an early day. ....Hall's new furnace will fire up next week....Thirty thousand pounds of amalgamating machinery, for the Stanford mill, is en route from Elko....Mr. Brown, who left six weeks since for Chicago to procure a mill, informed us yesterday that it would be ready to put in place by the 1st of January....The Vreeland & Bartlett mill, at Swansea, will be ready for work in a few days. It will have ten stamps of 650 pounds each, with six Wheeler pans and setters. A Blake's breaker is to be added, and two more pans....*News:* We visited the Freiberg Smelting Works yesterday. We found 238 bars of bullion on hand—the result of six days' run. The bars average 55 pounds each, and the assay value is $100 the ton. The ore is chiefly from the Bismuth mine. It is carbonate, very soft, and easily smelted. The supply seems to be unlimited. The works and mines are owned by Mr. Osborn, of Treasure City.

ITEMS.—*News:* Consolidated Chloride has housed the shafts preparatory for winter. Average daily yield of ore 59 tons. ...Constitution has again started up.... El Dorado (Chloride Flat) is running 10 hand-drills (with rifle powder) in the north ore chamber, 45-foot level, which tear down about 25 tons of ore per day ...Pogonip & Othello 35-foot level has moved steadily through ore 40 feet from the Center shaft, and the ore now increases in quantity....Tom Paine shows an immense amount of good ore, and is probably the nearest approach to a true fissure vein of any yet developed....Treasure Hill Mill & Mining Company is sending 44 tons to mill daily. A large body of very rich ore is being broken into east of the Posthole ... Domingo shows a large body of fine ore, that will work from $100 to $200.... The Truckee mine on Blue Hill had 15 tons worked that yielded $136. They have exposed an immense body of fine ore, which will work from $300 to $400. Some of the ore is exceedingly rich, being filled with chloride and chunks of horn silver ....*Empire*, 9th: About 3 o'clock Sunday morning the Stanford mill was robbed of 2,300 ounces of crude bullion, valued at $3,000. It was taken from a chest in the retort room, at the rear of the building. The same of the next day says the bullion was all recovered through the confession of one of the parties concerned....The tax on the proceeds of the mines of White Pine, for the quarter ending September 30, amounts to $13,917.81.....The Golden mine recently purchased by Eastern capitalists, was paid for a few days ago, and work on it will be started up on Monday. ....The Blackfoot mine, Blue Hill, has been sold to R. M. Cole, of Chicago, for $75,000. The vein is between six and seven feet wide, with regularly defined walls. The ore is rich in chloride and horn silver. Developments have been made to a depth of 60 feet.

New Mexico.

MINING ITEMS.—Elizabethtown *Telegraph*, Nov. 6th: The Aztec mill has turned out $2,000 in the last two days....The Central Co., on Moreno creek, are doing well.... The Montezuma mill, 30 stamps, commenced its run three days since, and is doing as well as even the Aztec. These two mills are chiefly owned by Mr. Maxwell, as are also the lodes....The Ayroa Honda quartz mill, 20 stamps, run by a double turbine wheel, commenced running four weeks since, on 30 tons of ore. The result was very small. There has been something wrong in the management. The rock contains visible free gold.

Oregon.

NUGGET.—*Sentinel*, Nov. 6th: We learn that a Mr. Turnbull took out of a claim on Althouse creek, a few days since, a nugget valued at $107. The mining prospects at that place are quite flattering, and the price of claims has gone up. The miners are working back into the bills.

Wyoming.

SWEETWATER.—A Mr. Cramer informed the Omaha *Republican*, of November 5, that Robert's mill commenced running the previous week, and 200 tons of ore were expected to be crushed in one run. The mills are being run day and night, and will continue all winter.

STREET GAS-LIGHTS MANAGED BY ELECTRICITY.—Gardner's patent apparatus is upon this plan: At each station-house is a key-board, and in connection with each key is an indicator, which corresponds with the indicators of electro-magnetic stop-cocks, placed in each lamp-post. When the operator wishes to light any street or district he presses the key, which moves the indicator in the office; at the same moment all the stop-cocks in that district or street move according to the indicator at the office. This apparatus has been placed in the U. S. Capitol at Washington, lighting over 3,000 gas-burners. The dome, rotunda, Hall of Representatives and other portions of the Capitol have been successfully lighted for over four years by this apparatus; also, A. T. Stewart's new store, where over 2,500 gas-burners are lighted; also, his new residence, Fifth avenue, and several other places of note.—*Artisan.*

GREAT STORMS.—The great storms of the past far exceed anything heard of within the present century. Probably the most destructive, of which we have any record, occurred in England, November 26 and 27, 1703; which caused the death by drowning of about 8,000 people on the rivers and coasts of that country. Twelve men-of-war were lost, besides an innumerable number of smaller vessels; 1,700 trees were torn up by the roots in the single county of Kent. It was during this gale that the Eddystone lighthouse was carried away with its unfortunate and confiding architect.

San Francisco:
Saturday Morning, Nov. 20, 1869.

Notices to Correspondents.

J. P., Railroad Flat, Calaveras County.—If your ore in Kern county be antimony, it is the sulphuret of antimony, which is so easily fusible as to melt in the flame of a candle. The color should be lead gray, except where tarnished blackish. Anything melting would in one sense "tin" the shovel. But it is not tin, for that on the shovel would be infusible, or, mixed with charcoal, reducible only with great difficulty.

"W. H. M.," from Placer county, will appear next week.

Representative Visitors.—Interior items state that P. Denny, Edward W. Kinsley and Henry W. French, Committee of the Board of Trade of Boston, escorted Charles Wolcott Brooks, representing the San Francisco merchants, have been making the tour of the entire State of California, inspecting the mines, visiting the principal agricultural sections, and in every possible manner investigating the fountains of our mineral and cereal wealth, and collecting, for the information of those they represent, full and reliable statistics respecting the present condition and future prospects of this State. Also, that the President of an English miners' society, representing 40,000 miners, "is now or has been" in this State with a view to collecting facts and affording facilities to members of his society for systematic emigration to the mines of the west.

Singular—if True.—A correspondent of the *Scientific American* says for two summers, since railroad work has been in progress on the Plains, rain has fallen freely during the summer, for some 25 miles on either side of the track; while outside of that strip of 50 miles the ground has remained during the season as dry and parched as ever. If this statement is reliable, it furnishes the most striking example yet noticed of the effect of civilization upon climatic changes.

A Fall.—George Jeffreys, a miner in the Hale & Norcross, on the 11th inst. fell with the cage 230 feet, from the third to the fifth level, without breaking a bone.

Hayden's Geological Surveys of the Rocky Mountains.

Probably as early as December of the present year, the results of Hayden's surveys on the eastern slopes of the Rocky Mountains will be published at the Government Printing Office, Washington, in the style and form of the documents of the Interior Department. With the maps, geological as well as topographical, and the geological sections, of which Hayden has made great numbers through the Rocky Mountains, and one across the entire continent, there will be presented for the general information all the striking physical features of the heart of our continent. This section across the continent, if it appears before the one made by the King survey, will be the first complete representation of the rocks from ocean to ocean that is given to the world, excepting those of Marcou and Hitchcock, which were mere sketches.

Hayden's particular work is specially calculated to throw light upon the extent, age, and mineral character, of our western coal formations. The merging of the Cretaceous into the Tertiary on the slopes of the Rocky Mountains is, precisely as we find to be the fact west of the Sierra Nevada, so gradual as to make any line of separation indefinable. Mr. Hayden, on the one hand, considers all the coal in the Rocky Mountains, and even westwardly to the Pacific Ocean as Tertiary, while Newberry and Le Conte say it is Cretaceous; the Diablo region being, according to Whitney, in transition strata between the Tertiary and Cretaceous formations. In order to make some demarcation between the distinctly Cretacous and the distinctly Tertiary, Hayden adopts the plan of constructing a formation of transition strata, into which the troublesome fossils that make such doubts, are referred. Some notes of interest on these coal formations along the backbone of the continent, are given in another column, by Persifor Frazer, one of the members of Hayden's party, who is further pursuing the subject of coal on Union Pacific Railroad account, at Laramie.

The Rocky Mountain Geological Survey embraces not coal merely, but everything belonging to the subject; the party under Hayden (consisting of thirteen persons) having been subdivided into three departments, whose reports, to correspond, will be as follows: On general Structural Geology, ages, formations, coal, etc., by Hayden, there will appear between 300 and 400 foolscap pages; on Mining and Minerals, by Mr. Frazer, about 78 pages; on Zoölogy and Botany, by Mr. Thomas, 50 pages. The leading object of the survey was to discover and point out the resources of the country, especially the agricultural, on which subject Mr. Thomas' report will contain an account of all the lands capable of cultivation or adapted to grazing, including a complete description of the Parks,—the San Luis, South and Middle Parks.

The scope of country was, in the main, from Cheyenne to Santa Fé, going south along the eastern flank; and returning on a meridian 150 miles farther west, within the Rocky Mountain range, and through the Parks; coming out at Puntia Pass, thence through the San Luis, and South Parks to the Salt Works, to Fair Play, Middle Park, and so on to Denver. The work done was necessarily little more than a reconnoisance,—a fixing of geological landmarks, similar to the fixing of points in a triangulation survey.

The maps, drawings and geological sections, were made by Mr. Elliott, a young San Francisco artist, formerly a telegraphic operator in this city, who has developed a special talent for work of the kind. He has made about 450 drawings, which are exquisite, not as mere fancy sketches of scenery, but works of a geological value.

The geological formations on the eastern flank of the Rocky Mountains are as regular as they can be. The Tertiary forms a kind of hog's back, or outer rim, at the eastern foot; then there are exposed, going towards the mountains, in the cuts made by rivers, next in order, the Jurassic, and the Triassic, which latter always abuts immediately upon the granite and gneiss of the Rocky Mountains. A ride of about ten miles from the Tertiary into the granite, was all that was necessary by Hayden and Elliott, to make most of these sections of the formations on the eastern slope as far down as Santa Fé, as they will appear in the report.

Stetefeldt's Roasting at Reno.

Sixty tons of ore are reported to have been roasted and chloridized with perfect success—up to Nov. 9th, and since then how much more we are not advised—in the new furnace of Mr. Stetefeldt now in operation in the English Company's reduction works at Reno. This furnace was fully described in the Austin *Reveille* and in the Mining and Scientific Press a year or more ago, when the principle was first tested in Eastern Nevada on a working scale, with favorable results. The furnace is a combination of the idea of the Gerstenhoefer with chloridxiation. Practically, Gerstenhoefer's operation is nothing more nor less than the dropping of sulphuretted ores down a chimney. By the time that the sulphurets reach the bottom, they are roasted very nearly as effectually as in a reverberatory furnace after eight hours of exposure. This may seem incredible, but is true—a fact well established by years of successful practice, at Freiberg, at Mansfeld, and at Swansea, and a dozen other places in Europe and in South America. The furnace is extensively in use as a means of manufacturing sulphuric acid cheaply, by way of by-product; and for that purpose it has completely swept the field.

Mr. Stetefeldt added salt to the ore; altered the furnace somewhat to adapt it to the manipulation of the pasty and volatile chlorides thereby produced, and that is all. Precisely what ores are worked with success, is a matter of vital moment; but there can be little doubt of any of the simple or compound sulphurets of the important metals, excepting, perhaps, that of lead. The cost of roasting must fall, then—if the furnace *continues* to be a success—from $16 or $20 to about $6 per ton, or less. This should enable entire districts producing roasting ores, worth only $30 per ton, to be worked to a profit.

The Gerstenhoefer, or the Stetefeldt furnace either, will roast large quantities in a day. The costs for a week's work are estimated as follows by the *Reveille*:

Wood, 18 cords, at $10 per cord	$180 00
Salt, at $45 per ton, say	100 00
Labor, three men, each $4 per day	72 00
	$352 00

The succeeding amalgamation, according to a telegram from Mr. Stetefeldt himself to Mr. Burns, given in the *Reveille*, is 90 per cent. of the assay.

Sale of Ores.—For the information of miners in the interior and in answer to frequent inquiries, we learn that all ores assaying $150, and upwards per ton can be disposed of in this city, or shipped to Europe on account with fair profits. For further particulars our readers are referred to Rogers, Meyer & Co., and others who make cash advances on ores, to Mr. W. T. Atwood, purchaser of copper ores assaying as low as 10 per cent., or to Mr. S. W. Howland, ore sampler,—all of this city.

A box containing a variety of apples (choice enough for the best of New England thanksgivings) reached this office Wednesday, from San José. They come without the name of the sender—express paid.

Chemical Manufacturing and Chemistry as a Business.

In a new country like the vast domain of the Pacific slope, whose resources are not half explored, and where new things of great commercial value besides gold and silver are constantly being discovered, a chemical laboratory can be the means of grounding many a new industry upon the most favorable footing, as compared with like manufactories in other parts of the world. Chemistry is almost as much the basis in fact of general manufacturing, as assaying is of mining. Dr. Veatch's discovery of borax at Borax Lake, and the utilization of so many of our manganese deposits, were suggestions of the laboratory. We know from like tests that we have inexhaustible deposits of very pure carbonates of magnesia, soda, and potash, within reach of communications. We know of deposits of nitrates, the most valuable of the natural salts of the alkalies, but not in sufficient quantity, nor permeating the soil to a high percentage as at Iquique, in Chili, the nitre mine of the world. Yet we do not know, for people do not always understand to what good uses a chemical analysis can be put; and we *may* have as extensive nitrate deposits at Mono Lake, as there are in Chili, or as rich phosphates at our door as those that have recently made such handsome fortunes in South Carolina.

Chemical manufacturing under our peculiar conditions touching raw products and local markets, is an established business in our midst, followed to a considerable range of production, but in a general way by only one establishment,—the Pacific Chemical Works of Messrs. Falkenau & Hanks. A visit to their new location at No. 215 First street, adjoining Selby's Shot and Lead Pipe Works, is full of suggestions of new and highly important though yet undeveloped resources. Our eye falls first upon a row of half a dozen specimens of coal, from different parts of Eastern Nevada, and we are astonished at the superior appearance of one of these samples from near Elko, which the assayer informs us has been determined to be in every respect a first-class article. The conclusion is that Nevada has all the coal she wants, already on the other side of the Sierra Nevada.

The pharmaceutical market and local demands for fine special chemicals, such as nitrate of silver, are supplied in many articles to advantage by local manufacture. This kind of work merits every encouragement, since it builds up industries doubly, by keeping at the same time in our midst for expenditure in other industries, the money that would otherwise be carried out of the country by the importers. There are manufactured here, besides, cyanide of potassium, acids of various kinds, aqua-ammonia, spirits of nitre, and chemicals of nearly all kinds, the display of which in the salesroom is creditable to the coast. The particular attention given to the analysis of ores, minerals, metallurgical products, mineral waters, soils, commercial articles, etc., is fully evidenced in the working rooms and laboratory occupying the rear of the grounds and basement. On account of the necessarily close connection of this branch of the business with the moving public, the former fine location of the works on 16th street, near the Mission, being disadvantageous to the patrons of the firm on account of the distance "out of town," were abandoned a few months ago, and the present excellent location and favorable grounds for the business, fitted up with all the conveniences and facilities of the former place. There is steam led to all parts of the works for drying, digesting, distilling, etc.; a large Bunsen burner, and another burner on the principle of the Davy safety lamp; a very ingenious water blow-pipe for glass melting, etc.; drying furnaces, muffles, amalgamating pans; and a hundred other contrivances too numerous to mention or to describe, fill the works, and add to the substantial usefulness of an establishment of the kind to the Pacific Coast.

New Books.

THE METALLURGY OF IRON AND STEEL, Theoretical and Practical; in all its Branches. With Special Reference to American Materials and processes. By H. S. Osborn LL.D. Prof. of Mining and Metallurgy in Lafayette College, Easton, Pa. 8 vo. pp. 972; 230 Engravings and 6 Folding Plates. Published by Henry Carey Baird, Philadelphia.

This is one of the most complete works on iron that has been published in any of the civilized languages of the "Iron Age." It takes the position in the present, certainly, as the best extant. To say this much of an American work, on a subject like that of iron making, is a striking comment upon the growth of the iron industry in America, as well as upon the enterprise and substantial character of industrial publishing, that has developed itself in so remarkable a manner in the Philadelphia publishing house of Henry C. Baird, whose catalogue of practical and scientific books actually written and printed under the auspices of the concern, constitutes a library in itself such as we scarcely dreamed that our industries were yet capable of bringing into existence.

"This work," says the author, "treats largely upon American practice, plans, and modifications, through the whole range of iron manufacture, beginning with a review of all the commercial ores used in America, and treating of American furnace-plans, methods of reduction, inventions, opinions, difficulties, and economies, from the mining of ore and the preparation of fuel, to the formation of steel in all its varieties."

It was begun with the intention of re-editing Overman's treatise on Iron, but the plan was too narrow to fit the times; and we have therefore a new standard work, to which there have contributed (besides Overman, by way of quotation), through the author, a body of our most practical men, located in works at Scranton, Pittsburg, Fort Henry, Lake Champlain, Jefferson Co., New York, etc. Prof. Osborn has very sensibly and even studiously avoided technical terms where popular ones would answer, with a view to taking the unread and the uneducated iron worker along with him into the fields of more intricate practice, so vitally governed by the principles of metallurgical science. To any metallurgist, even of the precious metals, the work must prove of interest and practical value where the method of reduction is by fire; since the principles of the blast, of mechanical preparation, of roasting, of reduction with coal, and of slagging are the same; and this is a kind of bringing home to us of the practicability of such a thing as successful smelting when the circumstances warrant, and the smelter understands himself. Smelting of iron surely pays, in the Alleghanies and their foot hills. In view of what has been tried, and said, and done on the subject of iron manufacture on the Pacific coast, of the field that is open here, and that is soon to be filled by more than the single Oregon Iron Works, this work will be welcomed by many of our readers. So extensive and entirely special, however, is it, that a brief review cannot do justice to it, nor convey even an idea of the matter of its contents.

As to method, the author gives as Part I, five chapters on the theoretical Metallurgy of Iron—the Chemistry, Ores, Special Properties of Iron, Fluxes, and Fuel; as Part II, twelve chapters on Practical Metallurgy—Roasting, Reviving or Reduction, and special manipulations, including all about the building materials, and blasts; and as Part III, four more chapters, covering the ground where iron production verges into the manufacture of malleable iron and steel.

It is wholesome, indeed, to be confronted with this evidence of the financial importance and value of mining and metallurgy in any shape, as a business, and as an industry that is at the foundation of all other manufacturing industries,—just as gold and silver mining are at the root of the world's doings and dealings in values.

This work comes opportunely for the Pacific coast. We are getting well over our dull "spell," that followed the opening of the Pacific Railroad; over our provincialisms, our unreasonableness in hoping to profit cent. per cent. or nothing, upon all ventures; our impractical habits that militate against thriftiness in business; our extravagances of generosity, that by common consent have continued to the present to make us regard the value of ten cents to be exactly equal to fifteen cents, on the "hit" theory—not a bad illustration, by the bye, of the shiftlessness of the majority of our community in regard to property. And iron manufacturing on the Pacific coast is destined to pay, as certainly as it is a fact that heavy goods cannot go to market 20,000 miles as cheaply as they can a few hundred miles.

Osborn's Metallurgy of Iron and Steel is sold by A Roman & Co., San Francisco, at $10 a copy, and is a cheap book.

DUFUR'S STATISTICS OF THE STATE OF OREGON: Its Agricultural Development, Natural and Historical Resources, together with the Physical, Geographical, Geological, and Mineral Statistics of the State. Compiled and published by order of the State Agricultural Society. By A. J. Dufur, President of the Society. Salem, Willamette Farmer Office, 1869.

We are indebted to Hon. S. E. May, Secretary of State of Oregon, for copies of this very valuable and interesting publication of 128 pages. It is a complete description of the resources and physical features of our northern neighbor, given by counties, making 21 chapters, each a detailed description of a section under peculiar conditions, and evidently written by one thoroughly conversant with his subject. In the concluding General Review there is a compact quotation, giving the substance of W. Lair Hill's prize essay on the Physical Geography of Oregon, written for the Agricultural Society; a full account of the Navigable Rivers and their features; of the Climate, Soil and Productions; Mineral Resources, Fisheries, Lumber, Harbors, Manufactures, Titles to Real Estate, Trade and Commerce; concluding with a list of Oregon newspapers, market prices, etc.

California has not received so complete a description by counties, even in Cronise's work. This is the kind of publication to induce immigration. There is only one thing wanting—a map to accompany the book—for with it almost any one would be induced to make a study of the country under the light of this additional mass of original and very readable matter.

Brick Making by Machinery.

Brick making is, notwithstanding our suspicions of earthquake shatterings, an active and profitable industry around the bay of San Francisco at the present time. As brick making by machinery may be considered a different branch of the business, producing a pressed article, which is more compact, one-third heavier, handsomer, and much more durable than the common brick, our readers who examined the two machines in the late Fair will be interested in the following figures, given to us by Mr. Rider, touching the merits and claims of his machine. The chief advantage claimed in its behalf are, that it takes the mother clay, as brought from the bed, and makes the brick directly, mixing at the same time with sand, if necessary, and delivering the article in such a shape as to be handled, directly from the belt, without requiring to be spread in the yard before being "hacked up" into heaps. In the ordinary hand method, the bricks are first laid on the ground; then "edged" or placed on edge; and after ten or twelve hours only they are piled up to dry—going from that to the kiln. One (or two?) handlings can therefore be saved. The Rider model in the Fair was one-quarter the size of a full-sized machine. Cost of the latter, including crushers, belt and everything, $2,200; weighing seven tons.

As to the relative amount of work that can be done by machinery and by hand labor in brick making: a "gang" of eight men will ordinarily make from 14,000 to 15,000 bricks in a day. With this machine twelve men will make 35,000 and *hack* them; or about a third more in proportion, with the hacking thrown in. How much the extra results will do towards paying for the investment in the machine, and for the steam engine with its running expenses besides, is left for the brick-maker to calculate.

WORK on the new Mint in this city is progressing rapidly; 150 men are employed. The work is as yet confined to the foundation walls. The outer walls are five feet thick and built of granite. The inner partition walls are generally about three feet thick. The superstructure which will rest on the walls will be a basement and two stories above.

Recent Patents.

FOUNTAIN PENCIL—J. Gardner Kenyon, Ferndale, Humboldt Co., Cal. This invention relates to an improved writing instrument which can be used as a substitute for both pen and pencil, and which can be carried about the person with all the facility of an ordinary lead pencil, and be always ready for immediate use. It consists of a tube about the size of an ordinary pencil case, or pen holder, having a small opening through the point to receive a slender stem which extends just beyond the point. A valve within the case keeps it perfectly tight when not in use. The cylinder or tube is filled with ink, and in writing the point of the projecting stem is pressed upwards by contact with the paper, thus lifting the valve and allowing the ink to flow sufficiently to write.

IMPROVEMENTS IN HAY AND GRAIN FORKS.—Walton & Brown, Stockton, Cal. (Brown assignor to Matteson & Williamson.) This invention relates to certain new and useful improvements in the construction of forks operated by horse power for the purpose of lifting hay and grain in stacking it. It consists, first, in providing a tubular head, which is plugged or filled with wood, in order to give it greater strength and lightness at the same time; secondly, in an improved manner of securing the hands or clips to which the tines are attached to the head, in order to secure stability.

UNITING ARTIFICIAL TEETH ON RUBBER BASES TO METALLIC PLATES.—Dr. E. K. Jenner, Healdsburg, Sonoma county, Cal. This invention relates to an improved construction of artificial teeth, whereby durability, strength and economy are combined with a proper degree of lightness, thus providing a very desirable and useful combination when applied to this purpose, and it consists in setting the gum work, in which the teeth are held, in a limited vulcanite or rubber base, and then by employing two thin metal plates, build upon the rubber base the plates which comes in contact with the palate of the mouth in such a manner that the two are firmly joined together so as to form one plate.

DOOR BUTT AND MARINE HINGE.—Charles H. Foster, San Francisco, Cal. The great cost of brass hinges and door butts for marine purposes, induced Mr. Foster to experiment, in order to produce a butt of equal advantages at a much less cost, which he seems to have accomplished in the present invention. The butt here claimed is simply a common iron butt galvanized so as to resist the action of the salt water, and having a brass pintle bushing in the socket which receives the pintle. The brass being virtually non-corrosive, and furnishing a bearing for the moving parts, a door butt equally free from liability to rust, as the brass butt, is the result, while its cost is but little more than the ordinary iron butt.

CARPET BEATING MACHINE.—Loran Miner, San Francisco, Cal. This invention relates to a novel machine for beating carpets, and its object is to clean the fabric by means of a series of elastic vibrating whips, which are caused to strike it rapidly as it is passed slowly before them, but are not allowed to remain in contact with it after the blow is given. It also consists in an improved arrangement of the cams and springs which lift the whips and impel them forward, so that the machine has all the efficiency of hand cleaning; and finally the whips are operated by a peculiar device so that they move from one side to the other over the surface of the carpet as it passes, and thus every portion is subjected to the beating.

DIVERTING A SUBTERRANEAN WATER COURSE.—Caldwell and others, at Hamilton, W. P., tapped the source of a spring which had been furnishing Moster & Guptel's yard or corral in that town with water, and the question came up in the District Court as to the right of the former, by a well on their own ground, to so divert water elsewhere and previously located by others. The defendants, Caldwell & Co., moved for a nonsuit, which was granted.

The Waterhouse Rotary Mechanical Power.

The following correspondence explains itself:

S. F., Nov. 3d, 1869.

To JOHN W. SUTTON, ESQ.—*Dear Sir*: Knowing that you have made the measurement of *power* a specialty for years, and are fully prepared to discuss the subject, will you be kind enough to inform me and the interested public, through the MINING AND SCIENTIFIC PRESS, of the particular merits of the Waterhouse Rotary Mechanical Power, to which was awarded the Inventor's Medal at the late Industrial Fair. By so doing, you will oblige many inquiring minds.

W. L. D.

S. F., Nov. 10th, 1869.

To W. L. D., ESQ.—*Sir*:—In reply to yours of 3d, asking for "particular merits of Mr. Waterhouse's Rotary Mechanical Power,"—without discussing the merits of the machine—I will give you a statement of a test I made of it while it was on exhibition in the Mechanics' Fair, where it was afterward awarded the Inventor's Medal. Mr. Waterhouse was explaining the machine to me in the presence of a number of others, and claimed that with it he could break an inch rope, raise 1,800 pounds, etc. I asked him at what expense of power? He did not know. I then asked him if he had ever tested it to see what the loss was, and he frankly acknowledged that he had not. I asked the privilege of making the test, and he consented, and was there during the time. The machine is made with a barrel, 2½ inches in diameter; upon one end of it is an inside gear wheel; a short shaft with an eccentric upon one end of it, that throws in and out a peculiar gear that meshes into the inside gear wheel on the barrel. The final action being the same as Watt's sun and planet motion; the short shaft making twelve revolutions to one of the barrel. Motion is given to the short shaft by a crank on the other end of it eleven inches long. A cylinder of cast iron ten inches in diameter, twelve inches long, with a hole through it 1¼ inches in diameter, weighing about 240 pounds, is suspended by a rope one-half inch in diameter, making the barrel three inches in diameter. A spring balance upon the handle of the crank showed that it required eight pounds to turn it and raise the weight, except in one place in the revolution of the crank; there it required twelve pounds. At this point the crank would stand with the weight suspended from the barrel; at all other points it would run back as soon as it was let go. The difference in the motion of the crank and the barrel (length of the levers) is within a fraction of 87 to 1. 8×87=696—240=456 pounds—the loss of power by the machine.

JOHN W. SUTTON.

FOSSIL ELK!—The skull of a fossil elk (or antelope?) found by Captain Nethertou on the Merced, recently exhibited at the Pioneer Hall, Stockton, is discussed by the imaginative editor of the *Independent*, who says: These animals doubtless existed during one of those distant epochs, described by Herbert Spencer of cycles, or periods, of 25,000 years each. The climatic changes following a known orbital motion makes an artic region a tropical one, and likewise reverse the tropics.

Weight of the head and horns 320 lbs. The animal is found associated with the mastodon, and is of post pliocene, or "recent age."

A LARGE MINING SYPHON.—Mr. G. A. Treadwell has a mining syphon at Gravel Range, Tuolumne county, 1,000 feet long and four inches in diameter, made of galvanized iron. The head of the syphon is sunk eighteen feet down a pit in a tunnel, and the descent from the highest point to the foot is forty feet, giving a difference of twenty-two feet between the levels of the two ends. The current is so strong that gravel an inch in diameter is carried out. The pipe leaks a little, so that once a day it must be filled by a force pump.

MR. GEORGE'S CONCENTRATION WORKS, in Colorado, embodying the results of this gentleman's careful study of concentration as a specialty, have been destroyed by fire, with Rider's mill; but he will "try again," being convinced that something is to be done in that line.

Correspondence from Heidelberg.

[Written for the Mining and Scientific Press.]

Crossing the Ocean in Iron.

Eds. Press:—A sea voyage to California is no new thing; and when we found ourselves on shipboard bound for Europe, the occasion had lost the solemnity it had when we contemplated it in the days of childhood. A few hours after leaving port, we were so perfectly at home that we half believed that this voyage was only a continuation of the last one we had taken. Yet there was quite a difference. We were aboard the Manhattan, of the Liverpool and Great Western Steamship Co., and were now for the first time voyaging in an iron steamer. And I think it was the unanimous expression of all the passengers that they were pleased with iron ships, if this was a fair specimen, for we certainly had as pleasant a passage as could be wished for. There was always a feeling of staunchness and solidity that took away all fear and added much to the pleasure of our voyage. One thing is quite certain, and that is, that at the present time they are in great favor on the Atlantic. I think that all the steamship lines leaving New York are composed of iron vessels.

We were so unfortunate to arrive at the mouth of the Mersey when the tide was low, and so had to wait some four or five hours for high water. This was the most unpleasant part of our voyage; and I could not help thinking it was much easier entering the Golden Gate. The more I see of other ports, the more I am convinced that we have one of the finest in the world.

It was a pleasant sail into harbor as we passed scores of East Indiamen almost home from their long voyage, and met others on their way out.

Liverpool Docks.

But the greatest sight was when we entered the city and saw its great docks filled with ships from all parts of the world. Much has been said and written about these docks, and I will only say that, much as I expected, I was not disappointed in the least. They are magnificent, and I will add, by far the best part of Liverpool—at least the best part that I saw.

The City Itself

Seemed to be a gloomy, dingy place. The houses were sooty, and the streets narrow and crooked, yet nicely cleaned. I have compared notes with many travelers since, and they all agree in saying, that more drunkards, beggars and harlots can be seen there in a short time, than in any other city in the world. After securing comfortable quarters at the Queen's Hotel, I started out to see the city. This was our first experience in an English hotel. It was quiet; ladies richly dressed were in attendance at the office and at the bar, and everything went off very pleasantly. Everything was nice and clean, and I cannot speak too highly of their fried soules and Southdown chops. Our hill was filled full of items,—room, meals, service etc.,—and handed to us on a silver plate; and then we were expected to give every one who looked at us a "tip." All Americans, I think, will agree in condemning this custom, that you must tip every one connected with the hotel. You are never certain what your expenses are till you are out of the place.

English Working People—Muspratt's College.

We made a hasty stroll through the city, and saw the working people as they were on their way to their work early in the morning, and could not help remarking the care-worn expression of those who were still young in years. We passed Dr. Sheridan Muspratt's College of Chemistry, but had not the time to stop; and soon after found ourselves near a large ship-yard.

Iron Ship Building.

This was rare good luck, for here were five iron ships, one almost finished, and the others in different stages of completion. Here in a short time we were able to see the whole process of ship building. The keel of one had just been laid, and part of the ribs were in place. Another had its frame nearly complete, and the builders were busy putting on the iron plates. There were a great many boys here at work, and they seemed to do good service. The frame and plates were put together with red-hot bolts, and there was the most incessant clangor, as the workmen were riveting them. Time of course will tell how valuable the iron ships are; but certainly the impression they made upon a stranger was very favorable. And here we were obliged to confess that the English had the start of us Americans. It would seem that before long Americans would take the matter in hand, with their usual energy, and distinguish themselves in making iron ships, as they have in making ships of war. On my way back to the hotel, I saw the nearest approach to a horse railroad that I have seen in Europe. It was a large omnibus with small wheels running on a track, yet differing very much from our horse cars.

W. B. R.

Heidelberg, Germany, Oct. 17, '69.

A Royal Sugar Maker.—The King of Denmark is largely engaged in beet sugar manufacture. His annual profits from this source are set down at $50,000.

Railroad Lands.—The Nevada *Gazette* says that the C. P. R. R. Co. is selling its agricultural land for $2.50 per acre, and its timber land at $5.

Metallurgy.

MOSHEIMER'S

Pioneer Mining School

—AND—

METALLURGIC WORKS.

ESTABLISHED.....1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to work any kind of ore, or mineral substances.

Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.

I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.

For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

G. W. STRONG,

ASSAYER AND WORKER OF ORES,

No. 10 Stevenson street, near First, San Francisco.

Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.
14v16qr.

Professional Cards.

J. S. PHILLIPS, M. E.,

CONSULTING ENGINEER

Examiner of Mines, etc.,

PAINE & CO.,

Mine Commission Merchants,

No. 225 BUSH STREET,

SAN FRANCISCO.

Will negotiate the sale of Mines and receive consignments of Ores from Battle Mountain and all parts of the Pacific Coast. They will sell or work the Ores, as the consignors may direct. They guarantee to pay the highest prices for Gold, Silver, Copper, Galena, Lead, Zinc, Antimony and Tin Ores, on the shortest notice. They will make test or working Assays for prospectors at a very low figure. They will also receive orders and furnish Miners' and Farmers' Supplies, including machinery of all kinds, at the lowest prices. N. B.—All correspondence with us will receive prompt attention. 10v19-3m

WALTHAM WATCHES.

Let every one who wants a Watch, read this carefully.

Especially if in some remote out-of-the-way place.

Now that the railroad is open, we propose to give the residents of California the opportunity of getting single genuine Waltham Watches at the

Lowest New York Wholesale Prices.

We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or

REFUND THE MONEY.

As an indication of the Prices, we will quote one Watch from our list. The P. S. Bartlett, Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,

$28 in Greenbacks, or about $20 in Coin.

All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the Mining and Scientific Press, and you need not put in stamps for return postage. Address in full,

20v19-3m

HEAVY.—The heaviest hammer in the world has recently been manufactured by an English firm for the Russian Government. The hammer, anvil block and all weigh one thousand tons—the hammer alone forty-two tons. It is to be used in forging cannon.

The largest hotel in the world is now being built for the Leland Bros., at Saratoga, N. Y. It will have a frontage of 1,050 feet, and will be five stories high; built of brick.

The largest iron works in this country are the Cambria Works at Johnstown, Pa. They cover five acres of ground and employ 3,000 hands. Their manufacture is railroad iron, of which 82,000 tons will be turned out this year.

The heaviest roof in California is that which covers the mission building at San Juan. It is covered with tiles, weighing about 150 tons, placed upon a frame-work weighing 30 tons more. The walls of the building are of adobé.

PROF. WARD'S CABINET BURNED.—The splendid collection of fossils and casts which has been collected with so much labor by Professor Ward, has been nearly destroyed by a recent fire. This cabinet is the result of many years of labor in all parts of the world. In making his collections, he has crossed the Atlantic eight times, and overland to California six times. The loss to science can scarcely be estimated. The cabinet was valued, pecuniarily, at $68,000, and insured for $35,500. The articles saved are supposed to be worth about $15,000. The Professor thinks the fire was caused by a spark from a candle, which probably lodged in some tow, where it smouldered, unobserved, until it broke out in such a manner that it could not be subdued.

COÖPERATIVE IRON WORKS.—It is said that several machinists have recently left this city for the East with the view of securing capital and men to start extensive iron works in this city next spring. It is further reported that an association has already been founded here as a nucleus of the movement. The plan embraces grocery and clothing accommodations, as well as union for soliciting and executing orders for work and dividing fairly the profits of their joint labor. Coöperation and full hours of labor are the surest means to retain, on this coast, that industry that properly belongs here. Short hours and uninterested labor cannot compete with the full hours and cheap labor of the Atlantic and Mississippi States.

THE OCEAN TELEGRAPH.—It is said that one of the wires of the old Atlantic telegraph cable is so eaten by some small insect that it is becoming very slow and uncertain in its operation. If this report is correct, the fact is a most unfortunate one in its connection with ocean telegraphy.

THE LOWER COUNTRY.—A conflict of opinion seems to exist regarding the southern counties of California, and the papers of the northern and central parts of the State are filled with accounts of returning prodigals who have come back to the homes they deserted.

THE early snow in the East caught many of the farmers napping, with many a field of corn standing and many acres of roots in the ground.

COTTA, B.—Lithology. London, 1867..... 3 00

CONGDON.—Mining Laws and Forms of California and Nevada, and the Mining Ordinances of Mexico. 184 pp. 8vo; flexible cloth; 1864..... 2 50

CROOKS & ROHRIG'S Translation of Kerl's Metallurgy (not yet received here in full)....

CRONISE (W. H. V.)—Natural Wealth of California..... 6 00

DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1867. 6 75

DANA'S Text-Book of Geology. Illustrated. 12mo, cloth. Philadelphia. (School Edition) 1861... 2 25

DANA'S System of Mineralogy. New Edition. 8vo. cloth..... 10 00

DANA'S Manual of Mineralogy. Revised edition, 1868..... 10 00

ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866..... 2 50

EVANS—White Pine..... 25

FREY & WELL'S Topographical Railroad and County Map of California and Nevada.. 1 50

FEUCHTWANGER — Treatise on Gems..... 6 00

GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeman and Bruno Kerl. 1 vol. 12mo. cloth..... 2 50

HITTEL'S (JOHN S.)—Resources of California; comprising Agriculture, Mining, Geography, Climate, Commerce, etc., etc.; the Past and Future Development of the State. 12m., cloth. 1 50

HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth..... 16 00

KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo. cloth..... 5 00

KUSTEL.—A Treatise on Concentration of all Kinds of Ores: Including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally. By Guido Kustel, Mining Engineer and Metallurgist. Illustrated with 120 diagrams on 7 plates. 1 vol. 8vo. cloth..... 7 50

LAMBORN.—Rudimental Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated..... 1 00

MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth..... 10 50

MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings..... 3 50

MAPS—Of Oregon, Idaho, Mexico, White Pine, etc., can be had at Bancroft's and Gensoul's.

OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth. 7 50

PHILLIPS (J. ARTHUR) — Mining and Metallurgy of Gold and Silver. New edition.) 8vo. Cloth..... 15 00

PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth..... 13 50

PLYMPTON—Practical Use of Blowpipe. 1868..... 2 00

Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1853..... 2 00

SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth..... 5 50

SIMONIN, L.—Underground Life; or, Mines and Miners. Edited by H. W. Barstow, F. R. S. 160 wood engravings, 20 maps (colored), and 10 plates of metals and minerals in chromo-lithography..... 13 00

SIMONIN, L.—Underground Life, or Mines Miners..... 18 0

URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York..... 16 50

WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco, 1865..... 1 00

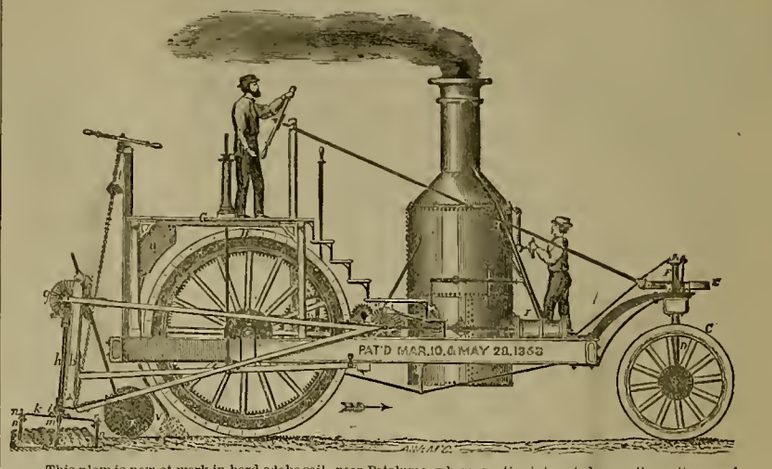
WHITNEY.—A Geological Survey of California. Report of Field Work from 1860 to 1864. By J. D. Whitney. Per. vol. quarto..... 6 00

YALE'S Mining Claims and Water Rights. 8vo..... 7 50

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco.

The Standish Patent California Steam Plow.



This plow is now at work in hard adobe soil, near Petaluma, where parties interested can witness its operation and judge for themselves of its practical utility. The success of this invention for plowing large fields, is established beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of cultivating their farms, are invited to call upon the inventor in the field, or address him by mail, Box 17, San Francisco. The inventor will negotiate the sale of patent rights (already secured) in England and France.

SPECIAL NOTICE.
TO DEALERS AND CONSUMERS
—OF THE—
H & L
AXLE GREASE.

Having received your liberal patronage and support during the last fifteen years, and desiring to further extend its consumption, and if possible meet the market of our Chicago friends, we have made a great reduction in prices, and from our long experience we will satisfy you that there is none BETTER, and through your liberal patronage that there is none CHEAPER.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.
F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.
OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the physician only can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever:* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen 25v18tf

International Hotel,
JACKSON STREET,
BETWEEN MONTGOMERY AND KEARNY STS.,
SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents
21v12 F. E. WEYGANT, Proprietor.

Coal of the Rocky Mountains.

[Written for the Mining and Scientific Press.]

A few years ago it was very seriously douhted whether coal occurred west of the Mississippi river in quantities great enough to supply the future demands of the enormons immigration to the West. This has proved not to be the case. As in other industries, it was necessary first that a great and urgent need should arise before the attention of people was called to this very important question.

This need presented itself when the Pacific Railroad became an accomplished fact, and the price of wood fuel began to grow dearer as the pine forests dwindled away from the line of the road. Two years ago it was douhted whether enough coal could be supplied to meet the wants of the Paicific Railroad from mines west of Omaha; and to-day this much at least is certain, that with proper enterprise coal enough can be furnished from the mines in Colorado and Wyoming Territories to supply the whole Western United States for all time. How came it then that these coal heds lay so long unknown and neglected? This is a very hard question to answer; and without attempting to do so, let me give you a few facts in regard to this coal.

Extent and Situation.

In extent, the coal beds have more than fulfilled the most sanguine expectations of those who believed that the West would yet produce everything necessary to the development of so vast a country, from its own rich treasures. Along the eastern flank of the Rocky Mountains, where the successions of the geological formations from the granites and metamorphic rocks to the most recent alluvium are most distinctly marked, and most easily observed, there occur, for the greater part of its length, between strata of rusty or yellow tertiary (?) sandstones, veins of coal which, as far as yet ascertained, continue indefinitely North and South.

Geological Age.

That this coal is of much more modern origin than the Pennsylvania and Illinois coals, is undoubted. Firstly, the general position of the heds is between layers which are unmistakably Cretaceous or Tertiary; then the appearance of the fossils themselves, resembling much and giving the impression of now-existing plants and leaves, etc., etc.

Quality and Characteristics.

This coal shows a tendency to crumble or "slack" on exposure to air, and into rectangular prisms in quite a remarkable way. From a number of analysis which I have made of coal from different mines, the percentage of carbon is found to be as great as, or greater, than in the best coals of Pennsylvania. I have not time at present to enter into the analysis in detail, but will merely state that its porcentage of carbon varied in over twenty specimens examined, from 45 to over 72 per cent. The percentage of water was also very variable. Two objections have been urged against the use of these coals, by Western practical men, and innumerable objections have been made by Eastern coal miners. The two leading objections, are first, the tendency of the coal to crumble, thereby choking up the draft; and second, the almost invariable presence in it of sulphur, which thereby unfits it for the blacksmith's forge. In answer to the first objection it might be said that Professor Hill, of Black Hawk, Colorado, who is in charge of the largest smelting works in the Territory, avoids the difficulty by the use of the "staircase furnace" and an artificial draft. It is true that most of the coal contains from .42 to 2 per cent. sulphur, but there are heds of coal in which sulphur appears to be entirely absent; and the writer has noticed it in general use in the blacksmiths' forges from Cheyenne to San Lazaro Mountains.

Importance to the West.

The subject of these Western coals is one fraught with interest to the whole country, and especially to Nevada and the Pacific States in general, because *thus far* no first-class coal has been discovered in them. If it be true that no *valuable* coal heds exist West of Wahsatch, U. P. R. R., it is nevertheless a fact that the further West valuable coal is mined, the cheaper will he that commodity.

Of the coal resources of Wyoming and Colorado Territories, there can be no longer a shadow of a donht; and to judge by analogy, there ought to be similar coal fields of first-class quality on both sides of the Sierra Nevada. Whether such will be discovered, remains to be seen, but every lover of California's beautiful trees, as well as every capitalist, will hope for such a discovery.

Anthracite Bed.

A curious recent anthracite—(an altered Tertiary-Cretaceous coal)—has been observed in several places in the vicinity of the Rocky Mountains, where large trap dykes have made their appearance in the neighborhood of such coal heds. One very marked example is that of a coal bed, the property of the New Mexico Mining Co's grant in the San Lazaro Mountains, thirty-five miles south of Santa Fé. Along with other coal heds similar to those referred to above in this grant, there occurs a five-foot vein of coal which is hard, and more black and lustrous than these coals, besides having a conchoidal fracture, entirely unlike the parallelopipeda of the usual Tertiary coal. Two analysis of this coal, one made by a chemist connected with Dr. Le Conte's survey of the 35th parallel, and the other by myself, agree in placing the percentage of carbon very high. It is almost superfluous to add that such anthracite heds, being formed by local heat, are not to be depended upon for any great extent, as are the more ordinary recent coals. P. F.

Steering by Steam.—The St. Louis *Dispatch* gives the following from a correspondent present at the trial of a new steam steering apparatus on a lake steamer: "The experiment was such a complete and marked success, mechanically, and seems in its principle to foreshadow such immense benefits to steam navigation, that it deserves the earnest and instant attention of the public. Instead of a cumbrous wheel in the pilot-house, a lever like the starter of a locomotive stood up from the floor, which worked either way from side to side by no heavier pressure than could be given by the thumb and finger, but which made the North Star, a long, narrow river boat, almost turn on her center, and then as instantly reverse. A doubt having been expressed as to whether she could be 'held' on the same steady course for a length of time, the steersman fixed on a mill chimney two miles distant, and made for it. After getting her from the previous violent swayings into true line, he dropped the bar and let her run for it, until all on board were satisfied. Where the steam rudder is left there it stays, and no power less than that able to overcome all the steam force of the boilers can shift it till again manipulated by the lever. Numerous experiments were made in turning, backing, twisting, and all with astonishing results. The steering power was instantaneous in its action. When standing still the rudder could be put down with such force as to swing the vessel a point or two."

[From the "Mechanics' Fair Daily Press, Oct. 30.]

The Patent Office and Patent Business.

In the first number of this volume of the Daily Fair Press, we gave an illustration of the National Capitol, an imposing edifice, a personal examination of which cannot but enlarge the feeling of national pride in every true son of America who visits it.

We now give in this, our last issue, a view of the second building in importance in the United States.

The Patent Office, although a less pretentious building, is considered by many as really the best building in America, from the superiority of the granite of which it is composed, and the grandeur and perfection of its architecture.

Patent Business in the United States.

No government in the world encourages inventors more than our own, and none of the countries in the world produce half, or a quarter, of as many inventions or patents as the United States. And still the number of patents increase yearly.

UNITED STATES PATENT OFFICE, WASHINGTON, D. C.

In 1868, 20,445 applications were made, and 12,959 U. S. patents issued; 419 re-issued, and 140 extended. This amounts to twice the number issued in 1865, and 3½ times that of 1858. There has been issued this year, up to October 19th, 10,467 patents.

Patent Business of the Pacific Coast.

We judge the present rate of patents issued to Pacific Coast inventors is about 300 per annum, which is a large number in proportion to our population. Patents are beginning to pay better in the Pacific States, owing to the increase of permanent improvements and manufactures. The inventions in our comparatively new country are more bold and original, and the proportion of patents granted to the number of applications made, is far greater than in the Eastern States.

The Commissioner says: "Questions as to the peculiarity of inventions become more difficult with this increase in the number of previous devices." This is an imperative fact, and is the real cause of complaint from inventors that they cannot now, as formerly, secure valid patents without the aid of experienced agents.

Information about patenting inventions and filing caveats, can be had free at all times at the office of the Mining and Scientific Press, where full Government reports and records can be examined, besides full copies of most patents taken out by inventors on this coast. The long practice of Dewey & Co. in patent business and the publication of a mechanical journal, gives this office advantages which Pacific Coast inventors cannot obtain elsewhere. The liberality shown by this firm towards all inventors in obtaining patents and making their valuable inventions widely known through the Press—which could only be afforded by strict attention to business—has given the office a patronage not exceeded by more than two or three agencies in the whole country.

Patents in Foreign Countries

Are taken out by Americans in larger numbers now than ever before. The Pacific Coast is honored by several foreign patents nearly every month in the British Patent Commissioner's Journal. Most of these (as is the case with the United States patents for the Pacific States and Territories) are taken out through the Mining and Scientific Press Agency. Our foreign cases are made out entirely in our office, sent and applied for in the name of the inventor; which is more satisfactory to the applicant than having it patented in the name of an agent and assigned back as most other patent agencies are in the habit of doing. Our arrangements are such that foreign patents can be secured for our home inventors, from two to six months sooner than they can be secured by any other means. Our business connections extend to every country in the world in which patents are granted.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is $25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 yrs and 6 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Our Office.

The office of the Mining and Scientific Press is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, and newspaper printing office — all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number —414 Clay street, below Sansome

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street, below Sansome, San Francisco.

Convenient Forge.

At the Eureka Foundry, (Thompson Brothers, on Beale street,) may be seen in operatino the very convenicnt round open forge which was exhibited at the late Mechanics' Fair, and whose merits are worthy of special regard by those who have much to do in a limited space either in very largo or very small shops, as well as by manufacturers on the second and third floors of ordinary buildings. It is merely a cylindrical casting, constituting an air reservoir into which a common bellows plays, set on end, and having a depression in the end to hold the fire. The *invention* consists in a conical blast muzzle, to feed the fire. This is pierced with three holes, of variable size, the effect of which, in that arrangement, is said to be a remarkable saving of fuel— about one-third of the ordinary amount—enabling the smith, at the same time, not merely to regulate and thereby keep nuder control his firo, but to get up a heat in half the usual time. The weight is from 100 to 500 pounds.

THE MASONIC MIRROR.—No. 3 of this new monthly, for November, has been received. It contains 64 pages of fresh and interesting reading, a large portion of which is especially instructive and desirable to members of the craft. "Was it Death," in No. 2, and "Country Children," in No. 3, are real gems. Edited by W. Bishop, and published by F. R. Carrick, S. F., at $2.50 per annum. [We suggest that Mr. C. print the name of the month on the first page of the cover of each issue.]

LOOK TO YOUR EYES.—If you will see C. Muller, 205 Montgomery street, you will doubtless be able to see better. ***

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

To Advertisers.

After January 1st, 1870, the latest hour for receiving mining and other advertisements for the M. AND S. PRESS will be during Thursday evening, as our paper will be printed for the interior mails on Friday morning.

FOR COUGHS, COLDS AND THROAT DISORDERS, use "*Brown's Bronchial Troches*," having proved their efficacy by a test of many years. The Troches are highly recommended and prescribed by physicians. Those exposed to sudden changes should always be supplied with "*The Troches*," as they give prompt relief.

THE PAIN KILLER is both an internal and external remedy.

THE PAIN KILLER should be used at the first manifestation of cold or cough.

THE PAIN KILLER.—Don't fail to keep it in the house ready for use.

THE PAIN KILLER is an almost certain remedy for CHOLERA, and has, without doubt, been more successful in curing this terrible disease than any other known remedy, or even the most eminent and skillful physicians. In India, Africa and China, where this dreadful disease is ever more or less prevalent, the PAIN KILLER is considered by the natives, as well as by European residents in those climates A SURE REMEDY.

THE PAIN KILLER.—Each bottle is wrapped with full directions for its use.

THE PAIN KILLER is sold by all druggists and dealers in family medicines.

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. no6

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24v18-4w

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

RETURNED.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

M. & S. PRESS.—The paper is a valuable one, containing notices of patents, and the latest improvements in mining and agricultural machinery. There is but little of real worth that comes to us from San Francisco, and amongst that little is the PRESS.—*Butte Record.*

New Mining Advertisements.

Allegheny Consolidated Gold Mining Company, Location of Works: Sierra County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-fourth day of September, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
W H Pompkins	9	1500	$450 00
A L Whitney	32	185	55 50
Charles Adams, Trustee	12	100	300 00
I N Thorne	13	125	37 50

And in accordance with law, and an order of the Board of Trustees, made on the twenty-fourth day of September, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, Room 37, New Merchants' Exchange, on the fifteenth day of November, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, 37 New Merchants' Exchange, California street, San Francisco. oc30

POSTPONEMENT.—The above sale is hereby postponed until Monday, the sixth day of December, 1869, at the same hour and place. By order of the Board of Trustees.
no20 J. M. BUFFINGTON, Secretary.

Glenwood Mill and Mining Company,—Location of Works: Greenwood, El Dorado County, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twelfth day of October, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. certificate.	No. Shares.	Amount.
Baleh, S M	not issued	70	$21 00
Janeson, L	24	70	21 00
Keenan, W	not issued	70	21 00

Abram Moger	no cert. issued	1612	80 60

And in accordance with law, and an order of the Board of Trustees, made on the thirtieth day of September, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 40 Merchants' Exchange, California street, San Francisco, on the thirtieth day of November, 1869, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. D'ELL STONE, Secretary.
Office, No. 40 Merchants' Exchange, California street, San Francisco. no13

Chicago and Detroit Consolidated Gold and Silver Mining Company.—Location: Chicago Lode and Company and Detroit Lode and Company, Monuor District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of July, 1869, an assessment of fifty (50c.) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, A. CASELLI, southeast corner Montgomery and Jackson streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fourth day of December, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the twenty-seventh day of December, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. CASELLI, Secretary
Office, southeast corner Montgomery and Jackson streets, San Francisco. oc30

La Blanca Gold and Silver Mining Company.— Location of Works: San Antonio, District of Ures, State of Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of November, 1869, an assessment of one dollar ($1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 312 Front street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the fourth day of December, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-first day of December, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOSEPH OOLDMAN, Secretary.
Office, No 312 Front street, San Francisco, Cal.

Manchester Gold and Silver Mining Company, San Francisco Lode, Monitor District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of July, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, A. CASELLI, southeast corner of Montgomery and Jackson streets, San Francisco.

ILLUSTRATED

MECHANICAL MOVEMENTS.

JUST ISSUED BY

DEWEY & CO.,

Publishers Mining and Scientific Press

SAN FRANCISCO.

This work is superior to any other of its kind in the English language. The drawings are of good size, plain and distinct, and the descriptions full and comprehensive to intelligent readers of every class.

THIS IS A CHEAP BOOK,

Notwithstanding most Scientific and Mechanical works are costly.

No Inventor or Patentee should be without it.

It is interesting to all classes of Mechanics, Farmers, and others, who have more or less to do with constructing machinery. It is

Valuable and Handy for Every Day Use

In every Mill, Factory, Foundry, Machine and Workshop. Sent to any part of the United States, for

$1, POSTAGE PAID.

A liberal discount to the trade and country newsdealers. DEWEY & CO.,
Publishers and Patent Agents, Mining and Scientific Press Office, San Francisco.

Woodworth Planers,

PLANERS AND MATCHERS,

With patent expansion, feed gear and other improvements made at Worcester, Mass., in the most finished and substantial manner; also every description of Richardson Merlam & Co's, Smith's and Wood's celebrated

Wood Working Machinery.

Embracing Mortising, Sash and Moulding, Smith's Stickers, Slat and Door Tenoning, Boring, Shaping, Scroll Sawing, Planing, Rod and Dowell making and Re-sawing Machines, Wood and Engine Lathes, etc., for sale at Eastern prices, at the Machinery Depot of

BERRY & PLACE,
112 and 114 California st., San Francisco.

☞Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free,

Gold Quartz Veins of the Alleghanies.

Dr. John S. Graham, an old California miner, writing from Ringgold, Georgia, to a friend in Tuolumne Co., speaks of these as follows: "The metallic deposits along the Alleghany range of mountains are nowhere very rich, but found in sufficient quantity to raise high expectations, and by economy and perseverance might be made remunerative. There are two gold belts extending across the northen portion of Georgia, converging and coming together near the Alabama line. Northeasterly, they pass through the upper portion of South Carolina into North Carolina; thence into Virginia. I have traversed the Georgia branches throughout their whole extent, with my hammer and haversack, and know exactly where the richest deposits are located. The country has never been properly prospected, and only here and there, at long intervals, are parties at work. There are but two stamp mills on the whole route; one crushing $2 rock, and the other $25. West of the gold belt, iron, lead, zinc and small quantities of silver ore are found. The placer mines have been skimmed over, and some have been very rich, yielding 100 dwts. a day. Gold here is never named in ounces, but always pennyweights. But since the war everything is in a ruined condition, and the people are very poor, nothing being left them but their lands and a portion of their houses. Where they can raise corn enough for their bread they seem satisfied."

The Wharton Automatic Switch.

—The *U. S. Railroad Register* was recently present at an exhibition of the working of this life-saving invention, and is eloquent in its praise. We quote: "A locomotive, with tender and empty truck cars attached, was put through its paces over the switch, forward and backward, switch right and switch wrong set, up and down the main track and up the siding and back, to show the automatic working of the switch and the impossibility of accident, no matter how the switch was set. * * We could see no flaw in its principle, and no hitch in its practice; and, what was very pretty, as well as reassuring to a nervous traveler, when the switch was set wrong and the engine came down over it at a speed of say 15 miles or under, every wheel of the train had to care for itself and right the switch in its turn; but when the engine came on at the higher rate of 25 or 30 miles an hour, the first pair of wheels threw the misplaced switch into order for all the rest of the train by tossing the weights clean over the perpendicular, a feat which a slower train could not do. In fact it excited a genuine sentiment of admiration in the spectators standing on the ground when the train went by, to see how neatly the switch bar was tossed into position; how entirely useless a switch-tender's presence had become."

There are a greater number of miles of railroad in the United States than in all other parts of the world—and that without taking into account the overland road, which is the longest continued reach of railroad in the world.

Mormondom.—The Mormons have 130 cities, towns and villages, and number over 200,000 souls.

The Mint at Carson is ready and waiting for the proper officers to take possession and put it into operation.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v16tf

FOUNDRY FACINGS.

BENJAMIN ELLIOT,

No. 483 Brannan street.....San Francisco,

Manufactures Foundry Facings constantly, from choice coals. Bituminous, packed in tight sacks. Anthracite and Charcoal ground together or separate, packed in barrels. Black Lead, Coke and Soapstone ground to order.

Foundrymen located far from choice material, can rely on having superior Facings forwarded to order. 10v18qr

Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 40 or 50 horse power with ease and economy. Awarded silver medal. Wm. Barnett, Monl'y Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.,

On hand and for sale. Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

H. J. BOOTH & CO.

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

To Quartz Mining Companies.

To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—

One Steam Engine, 60-horse power, made by Burden, Brooklyn, New York.

Two large Boilers, in complete order.

One Eight-Stamp Battery.

One Chile Mill.

One Cornish Lift-Pump, 6 inches, of superior make and finish.

280 feet of 5-inch Iron Suction Pipe.

One large Water Tank.

And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Pitmess, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.

The Company having ceased operations intend selling off their effects as speedily as possible.

For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or R. W. HASKELL, Pacific Fruit Market, San Francisco 24v18-1m

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

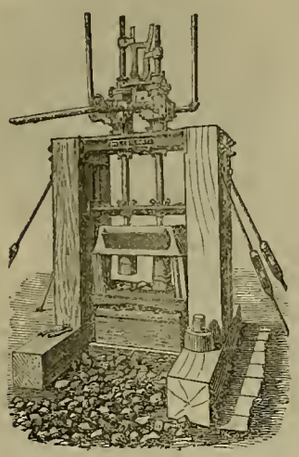
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and settlers for themselves, at the office, **229** Fremont street,

1v1 San Francisco.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

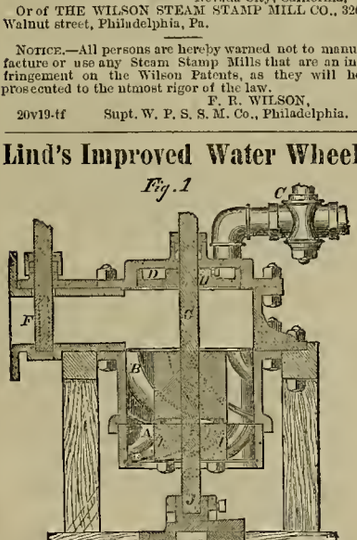
A. BICKNELL, Agent,
Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular. **A. LIND, Millwright,**
Pacific Iron Works, San Francisco.
Refer to John Sime and J. J. Haley. 19v19

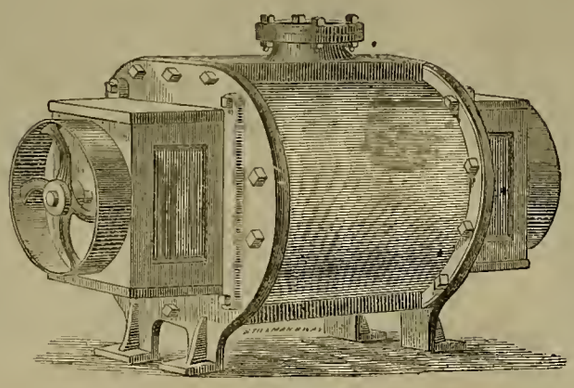
THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec.* 19.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

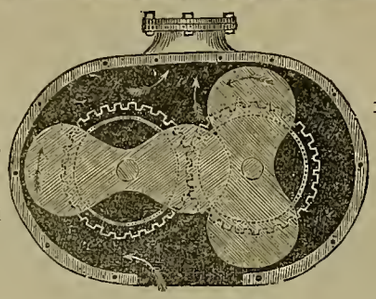
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 4, 1865; and Oct. 6, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

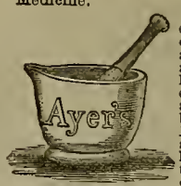
Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.



Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite,** they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers,** they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa,** but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins,** they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

DR. J. C. AYER & CO., Practical Chemists, LOWELL, MASS., U. S. A.

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All new patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveies, throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

DEWEY & CO.,
U. S. and Foreign Patent Agents.

THE GIANT
POWDER COMPANY

Is now prepared to fill all orders for

GIANT POWDER,

Put up in Boxes, either in Bulk or in Cartridges.

General Agents,

BANDMANN, NIELSEN & CO.,
25v16-3m 210 Front street, San Francisco.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13 ly Stove Store, No. 1 Clay Street, below Davis,

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For the Week Ending November 9th.

Ditching Machine.—Henry Benett, Linden, San Joaquin County, Cal.

Water Wheel.—J. G. Fredenburr and William V. Andrews, New Castle, Placer County, Cal.

Fountain Pencil.—J. Gardner Kenyon, Ferndale, Humboldt County, Cal.

Rotary Steam Valve.—H. Lombard, San Francisco.

Endless Chain Water Wheel.—H. S. Stewart, Yreka, Siskiyou County, Cal.

Excavator.—Alfred Eddy Pierce, Gilroy, Santa Clara County, Cal.

A 40-Ton Boiler for the government steamer Newbern, plying between this city and Alaska, has been constructed at the ironworks on Howard street. It rests on the sidewalk, where the workmen are applying the finishing touches.

A Valuable Book for Inventors and Artisans.—Dewey & Co., publishers of the Mining and Scientific Press, have just issued a neat little volume of over five hundred well executed wood cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the M. & S. Press office, postpaid, for $1.—*New Age.*

ENGRAVING ON WOOD DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the Mining and Scientific Press. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

Important to Assayers.
Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces.
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 18v6-1y16p

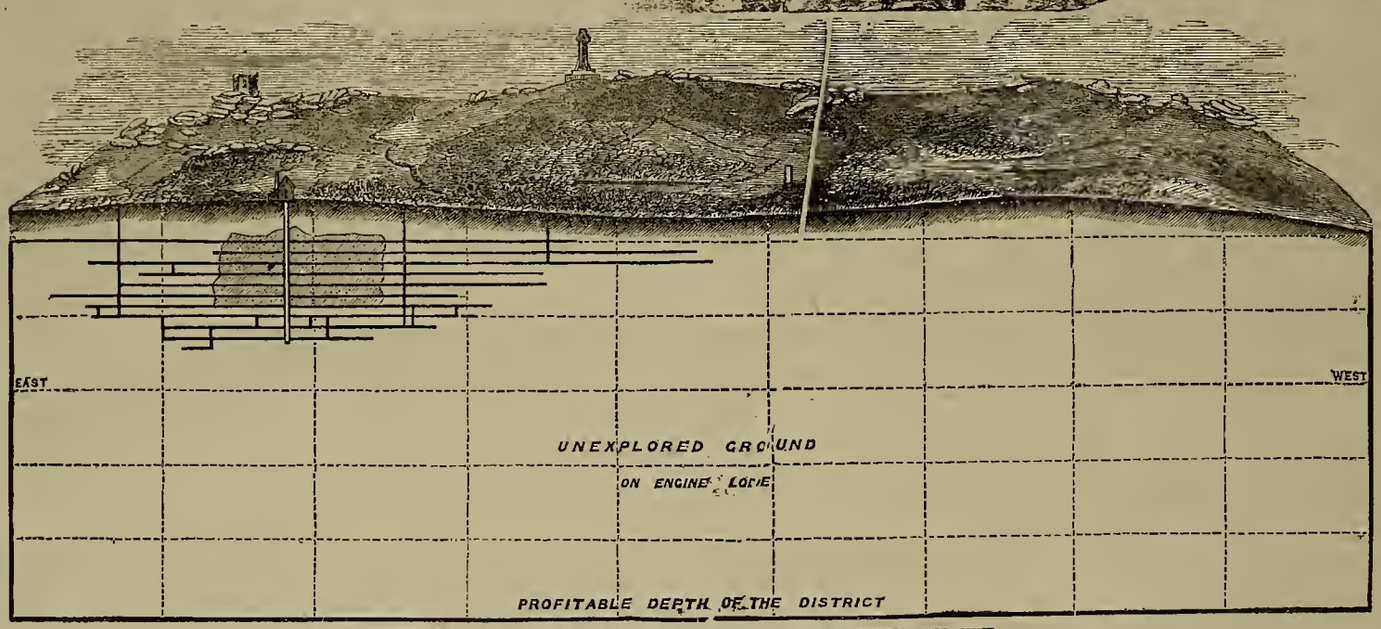
A Visit to the Carn Brea, and Some Notes about Cornish Mining.

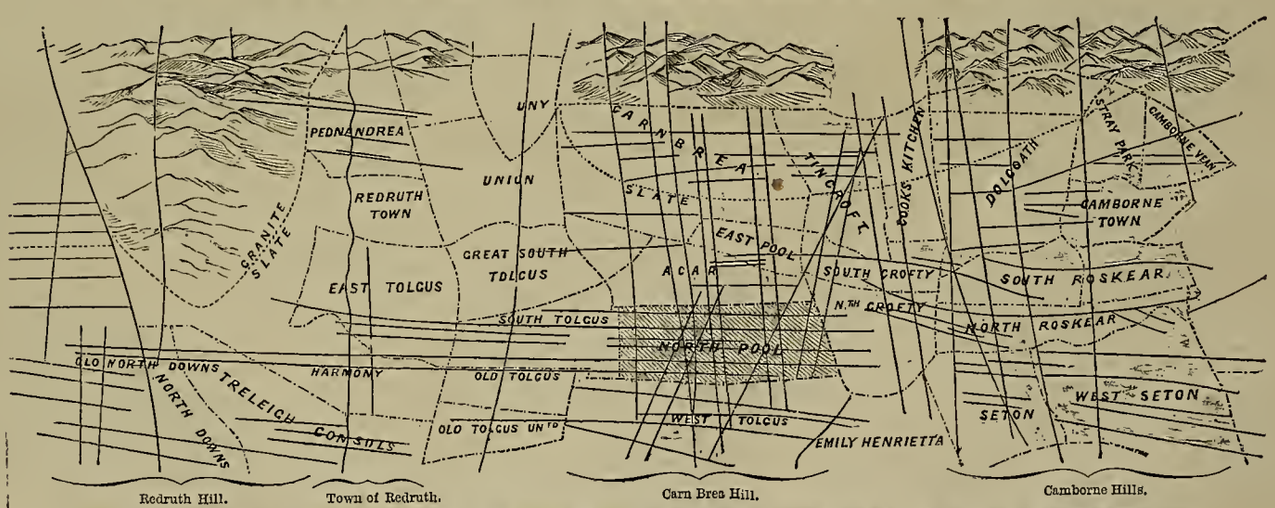
[Written for the Mining and Scientific Press.]

By one of those peculiar happenings, which we fancy to call providential, the writer, a miner of California by choice and profession, found himself, on a stormy looking morning, Oct. 16th, 1867, on board of a disabled vessel, being towed past the Castle of Pendennis, into the cheery, welcome harbor of ancient Falmouth on the Cornish coast. Taking advantage of the shore tug to visit this famous mining region, while the vessel was proceeding to Southampton docks for repairs, I am now enabled, with much pleasure to myself, to place together a few memoranda of two days' ramblings, that were packed with incident, affording me reminiscences of an interesting country and a genial people, such as I think it is seldom the lot of a traveler to know, or to appreciate. There were jaundiced sailors on the stone quays—one poor Swede especially, a convalescent—who told me a vivid story of a wreck in which he was saved off those headlands, a misfortune from which we had ourselves barely escaped, for a furious storm was brewing and that same night broke over Cornwall, which lasted during the whole of my stay, and gave a coloring, or rather a *chiaro scuro* of contrast, to the kindly welcome of the people within the taverns or old country "inns" that I happened into, but more especially from the mining captains I met, who accompanied me in the rain over their concentration works, or through their mines and smelting works, and with whom I did not escape the experience of some wholesome English hospitality, accompanied by genuine roast beef, and long clay pipes and ale.



VIEW OF CARN BREA HILL FROM THE NORTH, AND SECTION OF NORTH POOL MINE.

[Scale, 1½ Miles Long (Horizontal Subdivisions, 100 Fathoms; Vertical, 60 Fathoms). Sketched by J. S. Phillips, Former Superintendent.]



ROUND PLAN OF VEINS AND CROSS COURSES OF THE RICH CORNISH MINING DISTRICT ON THE NORTH SIDE OF CARN BREA HILL, LOOKING SOUTHWARDLY.

[Scale, 4 Miles Long by 1½ Miles Wide. Plotted by J. S. Phillips, M. E.]

Mining as a New Business, and as a Bad Business.

By the light of the moon I had been able to distinguish the Scilly Islands, and the hard-ribbed Lands End and the Lizards. These were the Cassiterides of which Homer wrote, and to which the Phœnicians traded; whence ancient Egypt obtained its tin, to make bronze ornaments and axes. Away back to the "age of bronze" that preceded the iron age, this leads us; and almost to the stone age, or at least 500 years, perhaps 800, before Christ. It was the shipping of ores and metals that made the Phœnicians rich and great, the first of commercial nations; so that mining in Cornwall may be said to have originated even commerce, for it tempted those people and induced them to learn to navigate by the stars. Bronze of the ancients is hard, an alloy of one tin to nine copper; it was the

only material then known that would do to make sharp cutting weapons. Egypt became civilized early, and Rome conquered the world because they went into these bad speculations of metallurgy and mining. It would appear, likewise, that the American Great West might even profit by remembering that, after all, we are not exactly the first and the only miners who thoroughly understand what we are about, or know how to get rich in the business of mining and manipulating stocks, ores and tailings. The Phœnicians and Romans surely must have had their Stock Boards, and their "Bank Crowd," too; or how could they ever have profited so much out of mining? On general principles it is conceded, to the *Bulletin* and the *Union* however, that cigar selling is a better business than mining. So is newspaper publishing, and haberdashery, for our wisest editors have tried both, and through them the public comprehend the business full well!

Flight to the Principal Mining District.

Where did the Ancients obtain their tin? From brooks all over Cornwall, as our gold is taken out of the California river beds. By the aid of steam and the smoothest of railroads that I have ever ridden upon, and a two shilling guide to Cornwall, it was easy enough to fly to the very spot—in my limited time, and with the greatest precision, while the storm was breaking over those sea-girt hills—where the earth has yielded most richly in tin and copper; up the river Fal, and via Truro and St. Day to Redruth.

And here, accompanied by a jolly and most excellent miner of the legitimate school, Capt. Thom. Miners, of the Carn Brea mine, we mount next morning the Carn Brea hill itself. Were I to dwell upon the incidents concluding the first day, and so continue, my notes would fill a volume; touching my visit to the surface and concentration works around Redruth, chiefly the Wheal Uny, where Captain James Williams, the head ore dresser, willingly braved the storm with me, that defied umbrellas, to show me the concentration works for that single mine, consisting of a host of different kinds of huddles, tossing barrels, and inclined planes, and sweeping hearths, and other concentration devices too numerous to mention, entirely covering the ground for two or three acres; where Captain Samuel Coad and M. Rogers discussed with me the merits of the very simple Cornish underground theodolite, in general use, and manufactured by T. A. Kissler, of Redruth, for $75; where I found the sorting and jigging of the ores being done by about fifty rosy young women and girls, in the neatest of white aprons, linen bonnets and the cleanest of stockings, (all which, strangely to me, did not seem to get dirty) singing to their work; how like a ghost out of the darkness and rain I walked into the blazing light of the furnaces of Redruth's smelting works, a mile up the valley, and satisfied my inquisitiveness, while I must have horrified the smelters, since access is ordinarily utterly barred to all but ghosts, in a storm; my visit to the house of Capt. Wm. Gribble, formerly of Grass Valley, now of West Wheal Tolgus mine; how I learned from the booksellers that there was no better book known to them in English than Budge and Haskell on Mining Engineering (30 shillings); how I got to Pool in time to attend a "Penny Reading" in the church, where all the young folks of *really* development were out, and behaving precisely as they would have done in Michigan or at San Rafael; and how I happened to wind up the day where there were gathered half a dozen of the jolliest bloods of the district, in a back room of the Treglown inn (carousing room, properly) with a bow window opening into a neglected garden, and a wooden wainscotting, amidst scenes of repeated draughts of ale, and pipes two feet in length in each man's mouth, consuming the landlord's tobacco, to songs of Merrie England, (the most amusing of which, to me, was one of our own most popular American songs of the war); all these matters I can barely allude to.

Descent into a Cornish Mine.

In company with the "Lord's Agent," Capt. Samuel Davy, on his quarterly visit, representing the land proprietor, Mr. Bassett, and Capt. Thom Miners, I went, next morning, through the Carn Brea mine, situated about like the mine shown in section in the view. There was more unfilled space, and less propping with timbers, than I had seen on the continent; the man-engines that carried us out were single, with a very long sweep, and stepping-off places, and were rather rudely constructed; the pumping arrangements were very superior, and the whole mine appeared to me to be worked on a basis of rigid but intelligent economy. The dressing works at the surface cover half an acre, and are very interesting, consisting chiefly of round buddles, sunk into the ground,—Borlase's and Hundt's. There is provided at the mouth the best washing and dressing room that I have ever seen in connection with any mine, and plenty of warm water, and clean towels; luxuries of slight cost yet great value to the toiling miner; and by me, in this instance, highly appreciated. Duck clothing, woolen underclothing, and a stiff, round-crowned felt hat, tallow candle, and clay daub, constitute the Cornish underground outfit.

The Carn Brea Hill.

Historically, topographically and geologically, the old Carn Brea is a notable hill. Carn is the Celtic word for a pile of rocks. It was on the top of the "carn" that the queer little old castle seen on the eastern end was built, the carn probably of an age older than historical time; the castle immemorial, and for aught we know dating as far back as the Phœnicians. Carn Brea was one of the sacred hills of the Druids. At several places on the summit, not far from the de Dunstanville monument, I could trace very distinctly the circular arrangement of blocks of granite, the remains of druidical temples. In one pile of enormous granite boulders there are scooped out of the rocks pot holes, which are popularly believed to have been used as sacrificial pans, where humans were formerly sacrificed, the lower ones being used to catch the blood flowing from above. The hill is a high granite mound or island, upon whose flanks the ancient Silurian ocean washed and deposited the killas, or clay slate, that contains most of the ore.

View from the Carn Brea.

A thousand mining stacks and a thousand *haldes* of ore and rock; Beacon Hill, a high bluff on the ocean's edge, away to the northeast; Redruth, Pool, and a hundred other smaller villages; the sweep of the wide ocean; the romantic looking fishing town of St. Ives, nestled down by the water at the foot of high hills far to the west. Behind St. Ives you can see something like a church tower, of semi-pyramidal pointing, that may stand as long as the pyramids. It is Knill's monument,—an eccentric, merry old Cornishman of two or three centuries ago, who died, and having money he could not take with him to the Druids' heaven, ordered this monument built, and willed that every year seven blith young virgins should come and dance around it. He left a liberal fund to distribute annually amongst the girls, and the joke of old Knill is that the ceremony is observed! They mean it well, in Cornwall as anywhere else, and come and get the money, and have a good time besides.

If we could See what is Underground,

What a stupendous work of ages would be here exposed—beggaring all the railroad viaducts in its heights, and the world's tunnels for length. For were the levels connected in one straight line, there would be a tunnel that would more than reach from the Lands End to Scotland, or 600 miles. Populations in the earth's bowels equal to three or four of our mountain counties, and machinery more than we have in all the mines of the Pacific Coast. The mines are being worked and paying, and will do so for ages, where worked on a common sense basis;—yet mining, our wise men of the West who have tried it tell us, is a losing business! Copper mining, that most miserable of all failures, is the stand-by. The names and lines in the ground plan all represent veins, cross-courses and mines.

Profits of Legitimate Mining.

The Dolcoath, Cook's Kitchen, Tin Croft, Carn Brea; the Roskears, Croftys, and Tolguses; the Seatons, etc., seen on the map, in the several runs or veins, are names within the profitable district 1x3 miles, that represent a known statistical yield, *each* of them $5,000,000 at least; while their probable yield not proven up by statistics, may be double or quadruple that sum in many cases. Honest work is done in Cornwall; and they stick to it for eight or ten years before they despair of profits, though not without most reasonable certainty of returns in the end. On the last page of the London *Mining Journal* may be seen, corrected to date, the lists of the mines: "dividend-paying," "non-dividend," or mines in abeyance, and the "calling" mines, that are making assessments; and the market values are fixed upon the following basis, as positively as law: A house in Cornwall is expected to pay for itself by its rent, in twenty years, or at five per cent. on the outlay, per annum; a mine is expected to pay in like manner in five years, or at 20 per cent. per annum. If the mine pays 15 per cent., the shares are held as only fair; if 25 per cent., they are held as very good; and the actual average run of the dividend mines is between those figures. £1 profit every year gives a market value of £5 per share, other things being equal. But the merits and promise of a mine will modify the result in the market; a far-seeing mine reporter being always on hand to see whether the mine justifies more or less than the dividends indicate. In the mines of Virginia City, where the shares are regulated by mortgages and lenders at a distance, much like playing upon a piano—an arrangement so much more systematic and controllable by the honest miner in San Francisco, though not based upon dividends nor the actual condition of the mine—it will surely be strange if stockholders, not to mention the honest miner in San Francisco, does not get rich; understanding so well what they are about! In Cornwall, all of the large mines have been "worked a second and third time,"—*i. e.*, abandoned and re-opened to great profit; a lesson of the value of good judgment in mining. Depth is a great feature there, the mines yielding better below, and often running from copper into tin. They proceed in their undertakings to a considerable depth upon indications,—the character of the gossan, or "iron hat" of the Germans, (the surface stains of the vein,) and upon what is known that the vein has made in the same district elsewhere as being good.

Costs of Mining.

The whole cost of mining varies from $22 to $25 per fathom on the vein. On levels this is six feet long, and height and breadth of the level, as given in the contract. The general cost, including the London City office expenses and milling, is estimated by J. S. Phillips (to whom I am indebted for many of the valuable points here given) at one-fifth the average general cost on the Pacific coast. Concentration alone of the tin ore costs at least the value of 12 lbs. of tin to the ton, when tin is worth $300 per ton of 2,240 lbs.—or 16¾ cents per ton. The costs of mining, reckoned by the ton, is about $4, or twenty five times as much as of concentration, on a rude estimate—*i. e.*, 300 lbs. of concentrated tin per ton average ore will cover the expense. By the fathom on the ledge, the average cost is £5 in tin veins. Copper can be mined and concentrated a little more cheaply than tin, requiring less treatment.

Labor, and Letting of Contracts.

A good common underground hand fit for responsible work, such as timbering, or shaft sinking and difficult places, gets $20 a month; a common hand less trusty $15. A good Superintendent always discriminates. Captains, or underground agents, or bosses, receive from $30 to $60 per month. The Superintendent or "Manager" from $40 to $250 per month, and he is not confined to one mine, having sometimes as many as five. The Manager goes around at least once a month to measure the work for the past month and "set" for the ensuing month, settling contracts with the workmen and making new ones. The price is fixed by the Manager and the mine captains in charge, who go down with him for the purpose. He examines the rock and writes on a slip the price he considers just, per fathom, covering the figures with his thumb; each captain does the same. The Manager then takes the captains' judgment, and averages their figures with his. Above ground he appoints an hour for workmen to come to his cuddy hole of a window, generally in a bow window in the office, through which the men are paid, and asks for bids, or inquires whether they will do the work at his price. Generally his price is the one, but sometimes the miners raise it; and it happens that they sometimes bid lower, when new men come who are anxious to get a foothold in the mine. The wording would be, on a shaft, for instance: "To be sunk by twelve men for the month of ——; to be carried twelve feet long by six feet wide at —— per fathom." The miners usually bid from 50 to 100 per cent. higher than they are willing to work for; but when the Manager's price is finally named with "Will you take it at that?" there is seldom a case but that some one offers.

"Market Mining Men" in Cornwall.

Stock miners exist in Cornwall too, but are soon found out by those whose business it is to find them out—the capitalists in London whom they seek to gull. In the mining district their role is understood from the first. Ballantyne, in his Cornish mining story, "Deep Down," (he is a Scotchman, and visited the place a year after I was there), describes the operations of one of these well dressed gentlemen in connection with "Wheal Doom" so graphically as to make one almost believe he has taken his character from out the Occidental or the Cosmopolitan hotel, San Francisco. He begins on the ground, on some unopened or untested lode, then proceeds to London, gets the name of some unscrupulous young lord, or capitalist or shyster, whose reputation is beyond his merit for honesty in the community, and forms a "company," with these, who never intended to invest a cent, at the head. The mine is brought very flourishingly into the market; and many a weak business man, or woman with some spare money to invest, is tempted into the fine business of imaginative mining. The doom of Wheal Doem in Cornwall looms up also in the mines of the west as we ride by—the speculators' mark of "Wheal done'em." There is a most execrable class of mining experts who lend themselves to these market miners, in making reports for them. I could mention some startling facts that have come to my knowledge of how "things are done," to the great detriment of legitimate mining, but am at present on another errand.

The Cost Book System.

In the carrying on of a legitimate mining enterprise it seems to me almost necessary that everything should be done honestly and above board. No reason can be assigned for secrecy to stockholders, other than the object of swindling them; for which mining affords facilities equal or superior to railroading. In Cornwall the evils of the corporation act have given rise and popularity to what is called the Cost Book System. Every shareholder, even of one share, can demand a sight of mine and book, into which every receipt and expenditure is entered and posted monthly; so that no secretary can mismanage, nor ring off stockholders' control, without the perfect knowledge and understanding of all the parties concerned. Should any ring mismanage, the shares of the minority thrown on the market at low figures, would depreciate the stock. Other features are: The facility with which it is applied to the settlements of disputes, the ease with which shareholders can escape from future responsibility, the precision with which they can determine their existing liabilities at any moment; and again the advantages which it affords to the successful development of promising undertakings, through the power possessed in raising from time to time just sufficient money to defray costs incurred, or expenditure required, in prosecution, and completely prevents the "freezing out" system in practice, by the controlling parties of the smaller stockholders. There ought to be no liabilities in mines worked upon the Cost Book system beyond those that accrue over a period of two to four months. A. B.

Principle of the Superheater.—Steam saturated with humid vapors cannot have the volume of elasticity of that which is superheated. Steam, as it is generally in the boiler, must necessarily, while rushing to the surface, on its passage to the cylinder, carry along with it a large amount of watery vapor. All this heated moisture requires fuel to raise its temperature. A proper application of a small amount of heat to this scalding vapor would convert it into steam and save it from premature condensation. The superheater of Carvalho does this. It is a very simple and comparatively inexpensive contrivance, that completes the process by converting this humidity into steam while on its passage from the boiler to the cylinder of the engine. The superheater consists of a pair of iron-heating chambers, cylindrical, to insure strength, and of the U shape. These contain a metallic filling, which draws the heat in from the sides of the chambers, and presents a large heating surface to the steam, breaking up its direct passage, and thoroughly drying every particle of it.—*The Alta Reporter's Fair Notes.*

The sulphur works of Lake county have been leased to Mr. J. T. Jeffries, the company's late superintendent, who has already commenced refining. The enterprise and assiduity of the owners of this mine, displayed in discovering improved methods for separating the sulphur from the salts, alkali, and other erudities with which it is, in its natural state, surrounded, has been rewarded by the production of a purer and better article of sulphur than can be obtained elsewhere on this coast—and competes successfully with the imported Sicily sulphur.

Mechanical Progress.

Steel Rails.

Althongh much has been said upon this snhject, it is as interesting as ever, and no less important. A long article in the New York *Tribune* has called forth letters to that journal from Abram S. Hewitt, the conclnsion of which, as expressing his ideas, and our own, of the importance of the subject, we copy: "In conclnsion, let me say that the conditions of the problem for making cheap steel, suitable for rails, are essentially different in America from what they are in Europe. The greater part of our ores contain phosphorus, which renders them unsuitable for the Bessemer process. But by the Siemens-Martin process pig iron containing phosphorus can be utilized, and the resulting steel welds admirably to iron, which is not the case with other kinds of cast steel, containing the same percentage of carbon. Hence, it is probable that steel-topped rails can be made more cheaply than rails all steel, except in those localities where the material is suitable for the Bessemer process. But it so happens that most of the phosphorus is mechanically combined with the oxide of iron in our rich and abundant magnetic ores. This peculiarity has just begun to attract attention, and there is, therefore, reason to hope that large amounts of material, now useless for the Bessemer process, will be rendered available for it by improved methods of treatment.

Again, these rich ores are admirably adapted to the so-called direct processes, by which the oxygen is expelled, and the resulting sponge of metallic iron left in a condition to be converted into steel by the Siemens-Martin or the crucible process. But these direct processes, although apparently so simple and inexpensive, have hitherto baffled the science of chemists and the practical skill of metallurgists. There never was a time when success was so necessary, or when so much talent, science, capital and energy have been devoted to the solution of this interesting problem; and I, for one, look for a successful result at an early day. With the production of cheap metallic sponge will come cheaper steel, cheaper rails, and cheap but safe transportation. Bessemer and Siemens are both engaged in trying to solve this great problem, each in his own way, and each devoting to the task not merely his great experience and high scientific skill, but the well earned fruits of past inventions, by which the cost of steel has been so reduced, as to be a successful rival to iron for uses the most ordinary. While I can not but wish them the success they deserve, I confess that, as we have the largest supply of suitable ores, I should prefer that the glory of this great and final achievement should be won by some one of our own inventors, who would thus rank himself with Franklin and Morse, and Howe and Goodyear, the American benefactors of all mankind."

HARDENING WROUGHT IRON.—An Englishman by the name of Wray has taken out a patent for hardening and carbonizing wrought iron in such a way as to give the surface a hard steely character, without interfering with its tough fibrous interior. For rails, shafting, armor-plates, and many other manufactured articles, this is desirable. Mr. Wray heats the articles in a reheating furnace, and while thus heated plunges them into a bath of molten cast iron. The length of time they are to remain in the bath will depend upon the nature of the article, and the effect desired. When the articles are taken out of the bath they are cooled by plunging them in water, in which may be dissolved salt, or other chemical or metallic substances which will facilitate the hardening of the surface.

THE UNION STOP WASHER.—This is a clever contrivance to prevent the nut on a bolt from turning. It consists of a disc, or two discs connected by a strap, of flexible metal, cut into a six-pointed star, in the center of which is the bolt hole. The washer being slipped over the bolt, the nut is screwed down and two opposite points of the star are bent up against its sides, holding it in a gentle but immovable embrace; no vibrations or expansions can make it turn. It does away with jam-nuts, and saves the expense of watching and tightening. Railroad engineers speak highly of it.

CUTTING UP LARGE IRON SHAFTS.—The Buffalo correspondent of the New York *Tribune* writes: "It is frequently very difficult to break up great shafts of cast iron when necessary to prepare them for the furnace. Old cannon have therefore sold low. Upon some, powder and nitro-glycerine have been tried in vain. Some have been burst by ice. Others by wedges driven by machinery, or long continued hard labor into the muzzle. At best it has been a slow, expensive process. Here, breaking is dispensed with; and they are cut in two by a continued stream of molten iron, which wears away the iron as a stream of hot water would eat into a mass of ice. The gun is rolled upon a frame in front of and level with the furnace mouth. Then the muzzle end is shoved in as far as possible, among other iron, the opening filled up and luted around the gun, the end of which is melted off. At the next charge it is shoved in another length, and is thus reduced until the breech can finally be rolled in and thus finished without any more expense than with pig or scrap iron."

ANOTHER NEW BOILER.—The *Artisan* gives the following in its report of the American Institute Fair: "The greatest curiosity in the way of a boiler on exhibition is that of Thomas Mitchell, of Albany. It consists of a horizontal wrought iron cylinder without any seam, and with hollow journals; and it has imparted to it a slow rotary motion. This boiler only has sufficient water supplied to it through one of its hollow journals to generate steam as fast as required; and the water thus admitted is prevented from assuming or remaining in the spheroidal state, by the rotary motion. The pressure in this boiler is regulated automatically by a self-acting valve, which only admits the water as fast as required, the valve being closed by a spring, adjusted by a screw, to shut off the water and stop the generation whenever the pressure of steam exceeds that for which the valve is set."

CHEMICAL FIRE ENGINES.—*Engineering* says that the principle of extinguishing fires by the use of water saturated with carbonic acid, has recently been extended by a Glasgow firm to engines, which can be worked either by manual or steam power, in such a way that the component parts required for the generation of the gas are forced separately into a vessel within which they mix, and pass beneath the self-created pressure through hose and nozzles. The apparatus comprises a wheeled carriage, the body of which is in the form of a tank made with sheet iron fixed upon angle-iron frames, and divided into three compartments. Pumps are fitted into the compartments, arranged to be actuated by a beam, on a rocking shaft which is provided with the usual levers for the application of power.

SETTING OF SAWS.—"A difference of opinion prevails among mechanics about the best way to set saws, some maintaining that the hammer and punch are superior to any of the patent setting tools now in use. A series of experiments which we saw performed some years since convinced us that the hammer and punch were imperfect tools for this purpose, although there is no doubt that the principle of the hammer and punch, as applied in some of the saw-setting tools which have been invented, is the best. A tooth bent and set by a blow will remain where it is put. This, on the contrary, can not be said of teeth which are bent by sets which act on the lever principle. Nevertheless, we have seen saws very perfectly set by the latter kind of tools." *Sci. American.*

PLATINIZING COPPER.—The following is from the *Quarterly Journal of Science:* "Add to a moderately concentrated solution of chloride of platinum finely powdered carbonate of soda until effervescence ceases, next some glucose, and so much common salt as will cause a whitish-colored precipitate. When it is desired to apply this mixture for platinizing, it is heated to 60° C. The objects to be treated are placed in a zinc vessel perforated with holes, which is then immersed for a few seconds in the mixture. On being removed the objects are washed and dried in sawdust."

GILDING POLISHED IRON.—"If a nearly neutral solution of chloride of gold be mixed with sulphuric ether and agitated, the ether will take up the gold and float above the denser liquid. When this auriferous ether is applied by a camel hair pencil to brightly polished iron or steel, the ether evaporates and the gold adheres. It is fixed by polishing with a burnisher."

Scientific Progress.

Dr. Hall on the Aurora Borealis.

A paper was read by Dr. A. W. Hall on Oct. 15th before the Polytechnic Branch of the American Institute, in which he enunciated the theory that the aurora is not due to electrical action, but is nothing but reflected sunlight. Dr. Van der Weyde takes issue with him; and in the *Artisan*, after giving an abstract of the arguments for the opposite view which he advanced at the same meeting, he adds:

"But the direct proof that the aurora borealis is by no means derived from the sun, is produced by the spectroscope, which does not show the lines peculiar to solar light and also to every object illuminated by the sun, but which in the aurora shows lines not seen in any other known luminous object. Moreover, Biot has proved that reflected light is always partially or wholly polarized; the auroral light, being not polarized, is therefore not reflected light, but self-luminous. This is, however, only a proof of what it is not; a proof of what it is, and which makes its identity with the well-known silent electric discharges *in vacuo* very probable, is, that it always proceeds from the magnetic pole, that the luminous beams passing high over our heads, from north to south, act on the compass needle, giving it an intermittent easterly or westerly deviation, exactly like an electric current would do after the law discovered by Oerstedt; and also that it induces such strong currents in telegraph wires that usually during the prevalence of an aurora the electric telegraphs are worked by it, without batteries, which is another phenomenon perfectly in accordance with the laws of electric induction."

AMERICAN ECLIPSE OBSERVERS.—The English prints speak in the highest terms of the zeal shown by American observers during the late eclipse, and the important gain to science due to their efforts. Prof. Young, of Dartmouth, is especially alluded to in reference to his announcement of his conclusion that the corona is a permanent aurora; and also to his beautiful method of determining the beginning and end of an eclipse, by keeping the slit of the spectroscope directed to the point at which the contact is to take place, and noticing the extinction and reappearance of the base of the bright line C in the spectrum of the chromosphere. We have before alluded to Prof. Young's notes.

OERSTED'S DISCOVERY CLAIM CONTESTED.—Dr. Adolph Ott writes the *Scientific American* in reference to the "law of Oersted," as it is called,—that magnetic polarity is at right angles to the electric current,—and says that although this law is generally supposed to be Oersted's discovery, and is so noted in most of the text-books, M. Hamel proved that the Italian physicist Romagnosi made the discovery in 1802. Dr. Ott furthermore says that Oersted must have known the fact, being in Paris at the time, where the subject was discussed in scientific circles.

PRESERVING ANIMAL SPECIMENS FOR FINE DISSECTION.—Dr. Alcock,—says the *Quarterly Journal of Science*,—proposed and practiced the following method: A saturated solution of corrosive sublimate in alcohol is prepared. When a dissection in water is in progress, a small quantity of this solution is added from day to day if there is any appearance of putrefaction; and by the time the dissection is completed, the specimen has become imperishable from the union of the corrosive sublimate with the tissues.

MATTER ALWAYS IN MOTION.—In the new volume of the "Smithsonian Contribution to Knowledge," is a paper by L. Magrini of the Museum of Florence, upon the "Continuous Vibratory Movement of all Matter, Ponderable and Imponderable." In this paper the attempt is made to prove that *movement is a fundamental law of matter;* that the movement always has existed, and *always will exist* so long as matter exists.

The Eozoon in Massachusetts.

H. C. Perkins says, in the *American Naturalist* for November: The remains of this, the oldest form of animal life thus far discovered on our globe, and found in the azoic [Laurentian] rocks of Ottawa, Canada, have, it is confidently believed, been within a few days detected in the serpentine of our "Devil's Den." The animal, if it may be so called, has been arranged by naturalists among the rhizopods, and would seem to have been a jelly-like living mass, spreading out on the bottom of the sea, capable of secreting calcareous partitions, and thus forming small chambers or cells, the interior of which has been filled by serpentine, which was deposited from the waters of the ocean, and took the place of the decomposing animated mass. This discovery, resulting from a visit of Prof. T. Sterry Hunt of Montreal to our neighborhood, will excite new interest in our limestone and serpentine quarry among geologists, and throw additional light upon the character and age of the rocks in this region. Mr. Edwin Bicknell (Preparator of the Peabody Academy of Science, Salem) has, by a microscopic comparison of a specimen of Eozoön, furnished by Dr. Dawson of Montreal, with one from the Devil's Den, fully established the discovery. In a letter from Mr. Bicknell which we have seen, he says: "I have no hesitation in saying, if the Canadian specimens is Eozoön, the Newburyport one is also."

APPLIED CHEMISTRY—MADDER DYES.—*Engineering* says the reds afforded by madder are in many respects preferable to those produced from coal tar. For instance, they resist the action of light and the application of soap. The coloring matter is due chiefly to the presence of alizarine that is extracted by the action of sulphuric acid on the madder first reduced to powder. M. Schutzenberger points out that madder contains alizarine, purpurine, pseudo purpine, an orange colored substance, soluble in alcohol, yielding purpurine on being decomposed by heat, and purpuro-xanthine, a yellow-colored crystallizable substance. He considers each of these principles as fit for dyeing purposes, although alizarine, which is the best, has hitherto alone been employed. The "fastness" of the different tints of colors produced from these dyes seems to vary in the inverse ratio of the quantity of oxygen contained in the substance in excess of the hydrogen. With an increase in the quantity of oxygen a violet color becomes gradually changed into various shades of red. Many of the details of the Turkey-red dyeing become, under this view, capable of explanation, that were formerly but little understood.

INCREASE OF WEIGHT DURING COMBUSTION.—The following experiment is described in the *Chemical News*: A small horse-shoe magnet is hung up at the beam of a balance sufficiently sensitive to turn with centigrammes; the poles of the magnet are immersed for a moment in the *limatura ferri* of the chemists' shops, and a beard of small particles of iron is caused to adhere to the poles; by means of proper weights placed on the scale-pan at the other end of the beam the equilibrium is restored. This having been done, the finely-divided iron is kindled, by approaching to it the flame of a Bunsen gas burner, and continues to burn. While burning, it will be seen that the arm of the balance on which the magnet is suspended considerably deviates from the horizontal position, thus indicating an increase of weight on the side where the experiment is going on.

SOLUBILITY OF SULPHUR IN COAL-TAR OILS. M. Pelonze finds that the solubility increases with the density of the oil and the temperature. Thus, 100 parts of a light benzole, sp. gr. 870, and a boiling point from 80° to 100° Cent., will at the ordinary temperature dissolve only 2·1 parts of sulphur, and at 100° Cent., not more than 15·5 parts. But a heavy oil, having the sp. gr. 1·020, and boiling from 220° to 300°, will at the common temperature take up 7 parts of sulphur, and at 100° 54 parts. At higher temperatures, the heavy oil will dissolve an indefinite amount of sulphur, but above 200° decomposition of the oil takes place, and sulphuretted hydrogen is evolved. The best oil for extracting sulphur would appear to be one which has the density ·995, and boils from 180° to 210°.

ARTIFICIAL CARBOLIC ACID.—Berthelot finds that by treating acetylene with fuming sulphuric acid it is converted into a sulpho compound, $C^4 H^2 S^2 O^4$. The potash salt of the above compound on being fused with caustic potash yielded copiously carbolic acid.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Small vs. Large Thrashing Machines.

There appears to be a growiug disposition, in many parts of the Eastern States, to give up the use of large thrashers, and separators, which itinerate from farm to farm, over a large district, with their large equipment of horses and men, and substitute in their stead smaller machines, to be owned by individual farmers, or at most by a combination of two or three neighboriug farms. The advent of a large power thrasher upon a farm, with its army of men and troop of horses, is beginning to be regarded, in its destructive effects, as very much like a "Morgan raid." The work performed by these machines is thought to be out of all proportiou to the noise and confusion they produoe, ina well-regulated household, and the waste and cost which they entail.

It is held that a small machiue, capable of being operated by two horses and three or four men, the regular farm laborers perhaps, is much cheaper, and is attended with much less waste and coufusion. A small machine, such as indicated, can be operated at leisure, at intervals betweeu other duties, or at the perfect oouvenience of the farmer.

Upon the subject of relative cost for thrashing and separating, between the two machines, the following figures have been given: It is claimed that with a 10-horse thrasher, requiring twelve bands, and turuing out 300 bushels of wheat per day, the cost is 15 1-6 ceuts per bushel; while a 2-horse machine which can be ruu with four hauds, will turn out 150 bushels at a cost of from eight to nine cents per bushel. This estimate is on the assumption that all the hands are hired in both cases; wheu in fact with the small machine the work can be generally done by the regular farm hauds, and at a much less cost than by hands especially hired for a short time only.

It is also claimed that a much greater waste inevitably attends the larger than is encountered with the smaller macbiue. This waste grows out of the fact tbat the larger machines are always fed heavily or forced, and with more or less irregularity, whereby many heads of grain escape unshelled, while much that is shelled is carried over and lost with the large bulk of straw. Moreover, the large machines are always operated in the open field, where much grain is scattered upon the ground and lost; while in the use of smaller machines more care will be observed, or they may be operated npon temporary or permanent floors, where all such wastage may be swept up and saved.

Many extensive farmers in the uorthern Mississippi States, who have used both, say that they would not allow a large machine upon their premises, if it would do its work free, as the waste, extra cost aud trouble would amount to more than the entire cost and trouble of the small machines. It is quite apparent that the popnlar current at the East is setting in the direction of small thrashers. In Penusylvania, very little is known of large machines. They never did receive much favor in that State. Nearly every good farmer there owns his own machine.

How far snch practice would be applicable in California, we are not prepared to say. Our long, dry harvest time is much more favorable for open field work than the uncertain weather of the Eastern States, where barns are an absolute necessity, and where nearly all such work *must* be done under covor. One thing, however, is quite certain: we need] some system by which our farm labor may be made more continuous and regular. Diversified farming is a positive necessity to success in that pursuit, and must eventually be more generally introduced on this coast. Tbat would require barns and store-houses, with which the use of small thrasbers might the more readily and economically be introduced—and possibly be made more profitably thau the system now in universal use here.

Agriculture in the Mines.

As an evidence of the interest felt iu behalf of the introduction of agriculture into the mining counties, we notice that the local mining papers are everywhere calling attention to the advantages which their respective localities preseut for such industry. There is scarcely a mining county iu the State which might not raise every pound of produce needed for its inhabitants, eveu to flour and butter. The introduction of agriculture into the mines is the sure and only road open by wbich our mining counties can relieve themselves from the pecuniary embarrassments under which most of them are now laboring. Apropos to the above, we clip the following from the Alpine *Chronicle*, oue of our mining exchauges:

"Srictly Mining."—As some, in this county, have considerable to say about this county being a "strictly mining county," we cite the fact that the ranches, occupied, comprise, per assessment roll, 3,434 acres. Most the whole of the county is fitted for agricultural purposes. The mountains are good for grazing and the raising of hay, and the valleys are capable of producing every kind of grain and vegetable; and it only requires a ready market to stimulate and develop the agricultural industry of Alpine county. In Hope Valley aloue upwards of thirty tons of butter were made tbis season, valued, forty cents per pound, at the bandsome sum of $24,000.

Rain Fall.—Somebody has beeu going into an elaborate calculatiou of the amount of water which fell during the great storm at the East about the first of October. In weight it is set down at a fractiou over twenty-eight million tons. If this mass of water should be collected in a single cbannel, it would form a river twenty feet deep, a quarter of a mile wide, and 6,500 miles long. This was the volume and weight of water which fell within thirty-six hours, sweeping away many millions of dollars worth of property and destroying a great uumber of lives—doing more damage, in fact, than half a dozen such earthquakes as that which occurred in thisregion one year previously, almost to a day. Not the least amoug the marvels of such a rainfall, is the fact that the atmosphere can contain, at one time, such an immense weight of water.

To Destroy Weeds in Walks.—Almost every person, in country or city, has some walk which they wish to preserve free from the intrusion of weeds or other growth. Much time and expense is often spent to secure such a result. The Loudon *Journal of Horticulture* gives the following as a most efficient preparation for such a purpose: "One pound of arsenic is dissolved in three gallons of cold water and boiled, stirring it while boiliug, then add seven gallons of cold water, and two pounds of crushed soda, applyiug it to the walks with a fine-rosed watering pot, taking care to keep it from the box-edging or grass. The above quantity will be enough for twenty-five square yards. It must be applied in dry weather only."

Profits of Farming.—Statistics show that the people of Vermont, a State almost exclusively devoted to agriculture, hold more money and other property *per capita* than the people of any other State iu the Uniou. If this is so, it speaks volumes in favor of the propositiou that farming, intelligently pursued, is profitable.

A Big Crop.—W. J. and Noble Clark, on the old "Buckeye Ranch," secured a crop of wheat of uo loss tban 50,000 bushels—tbis, bcsides other crops, fruit, stock, etc. The yield of wheat averaged twenty-seven bushels to the acre. —*Mountain Democrat.*

Stockton Correspondence.

[concluded.]

[Written for the Mining and Scientific Press.]

Wagon Manufacturing.

Mattison & Williamson also manufacture wagons of all kinds. There bas been quite a change iu this business witbin a few years. Heavy wagous are not so much in demand as formerly, although the teams are larger than ever before. Experience has settled the fact that a heavy load hauls easier over yielding ground aud rough roads on twelve to sixteen wheels than ou four wheels; aud so, while more wagons are required, wagons tbat are designed to carry over eight or ten thousand pounds are seldom ordered. Iron hubs are not so much used as formerly, owing to the danger and inconveuience from "drawiug tho sun," or heating, during the uninterrupted sunshine of summer. Stockton is renowned for her wagons and carriages, and several husy mauufacturiug establishments are worthy of note.

Wharf Improvements, Etc.

About the wharves I found things quite lively. The heavy freight mostly reaches this city by steamboat, as before tbe railroad was finished; although tbe low rates of transportation are constautly gaiuing favor for the W. P. R. R.

In Stockton slough a dredging machiue is constantly at work widening and deepening the cbannel. The dirt removed is used to raise and lengthen the streets along the wharves, which are also being lengthened and repaired. And I may add here that much work is being done in raisiug the grade of the streets throughout the city.

Steamboat Building.

On Mormou slough I found the hull of a new steamboat on the stocks and in rapid progress of completion. The materials are all of the best quality, and the fastenings very substantial. The work is all done by the day, and in the most thorough manner. This boat is designed for a stern wheel, is 120 feet long, with 30 feet beam and 5 feet sides. It has seven keelsons,—three 6x16, two of them 3-inch planks extendiug to the deck to form water-tight bulkheads, and two corner keelsons 8x8 square, kuuckle amidships, moulded fore and aft. The boat is being constructed for river traffic, aud is to be driven by two 14-inch engines, 5 feet stroke. Mr. C. M. Small, an experienced workman—the architect and master-builder—informed me that it will be ready for launching in about six weeks; in good season for the opening of the San Joaquiu river navigation.

The Lumber Yards

Are well filled, and the saw-mills aud fiuishing works all busy; and the many ranch teams loading with such material sbows tbat tbe county is building up itself, as well as establishing the growth of a city.

The Storehouses

Are being filled witb grain. Owing to the low prices of grain and scarcity of money, farmers are paying storage and 2½ per cent. per mouth on money advanced on their grain.

The Flouring Mills

Appear to be doiug a rushing business, and striving to make good flour; but the quality of wheat this season is below an average.

Foul Wheat.

I find it a standing complaint that wheat is generally not well cleaued; in fact, that it is brought to market by farmers in very dirty order. From many samples which I havo seen and examined, I am compelled to sympathize with tbe complainants in this case. While nice, clean wbeat finds a ready sale at a fair price, abont nine-tenths of all tbe wbeat sold is *discounted*, and ought to be unless better cleaned.

Cleaning Wheat.

Oue is constrained to bolieve that tbere must be either something radically wrong in the separating apparatus uow used, or else that the difficnlty of cleaning is insurmountable. My opinion is, that no matter how badly mixed the wheat is with chaff, sand or dirt, it can be tboroughly separated. Tbe difficulty lies in indifference, in carelessness, or in imperfect machinery. In every flouring mill that I bave visited in the State, I find that there is more difficulty and perplexity experienced by the millers with their cleaning apparatus than with everything else about the mill. The several new methods of separating lately patented sbow that there is a class of men awake to the importance of tbis necessity; but whether any of them will fully meet the requirements, is a matter admitting of some doubt.

At the storehouse of Cbarles & Copely I saw

A New Machine for Cleaning Wheat,

Just built by them, and working with steam power. How it will serve the purposes I did not ascertain. They claim an improvement in suctiou fanuing. The wheat falls eight feet down the chimney, right and left, from step to step, across the flue to the screens. The wind is let in through several narrow openings under each step, so as to cut directly through and through the falling wheat, thus subjecting it to equal, thorough and repeated fanning. This certainly appears to be an improvement on the old style of flue, wbich allows the wheat to fall to one side and the wind to escape up the other side. The screens are set at the ordiuary inclination, and have a plane, oscillatiug, rectilinear motion, so as to slide all barley, oats, etc., *over* the screens, instead of *jumping them through* with the wheat. Other screens allow all small seeds to separate from the wheat. [We hope to hear from Charles & Copely, and learn the particulars of the working of their machine.—Ed.]

What farmers most require is a thorough and efficient separator, which can be attached to any thrashing machine—one tbat will do all work at once, saving all tbe good grain and all extra handlings and expense. The iuferior grains and seeds are not wasted, but most ecouomically used, wheu fed at home to pigs, poultry and farm stock. But tbis thing is "sure and certain:" whatever is done or left undone, the farmer must eitber lose good prices and wastage from bad cleanings, or be able to command the market with a good article of clean wheat. S. H. H.

Why Pork Shrinks in the Pot.

An old farmer, in the *Homestead*, auswers the above question as follows: "Hogs kept low in flesh in summer and autumn, and then fully fed when shut up for fattening, will gain fast, appear to be doing well, and look well when dressed, but will weigh light, aud boiling will prove the flesh to bo puffy. The little cells, of whioh the meat seems to be composed, are filled with gelatinous matter, wbich has not had time to become hard and firm—it is partly soluble in boiling water; hence pork shrinks in the pot. The same kind of pork results from feeding mostly on animal food, as at slaughter-houses, and from irregular feeding, or from killing sows when in heat.

To produce pork that will not shrink in the pot, the writer says he first has a good breed; they are never allowed to fall off in good condition from the start they get from their mother's milk, or never know stint or stuut while alive. Early in autumn he takes them up in high order, and begins to fatten them, increasing their rations of grain till they are fat aud ready to kill. Then he feeds them oue week more, and makes due preparation for butchering, wbich is done early in the day by good hands. When thoroughly cooled, cuts up and salts down (not allowing his pork to freeze) using plenty of the best salt, aud filling up the barrels with brine, and not with water, as some do. This method secures pork, white, firm, compact, and almost as solid as marble, whicb, when well cooked, will be tender, juicy, melting, and delicious, never shrinking in the pot."

The English Walnut is a perfect success in Los Angeles county, where it grows to perfection. The only trouble in gathering the fruit is the picking it up, as every nut disengages itself from its bark aud falls to the ground when full ripe. It is unaffected by heat or moisture. There are over 15,000 of these trees in Los Angeles county, one-fourth of which are in bearing. Their average yield is about $30 to the tree, aud the crop is considered a sure one.

Stock and Finance.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, November 26, 1869.

Financial.

Money is comparatively easy in this market, although the savings and loan institutions are not free lenders, nor have they been for some time past. Depositsdo not come in as plentifully as usual, the money being used for outside operations. The delay in arrival of many foreign vessels, now fully due, has shortened the demand for customs, and our importations have also fallen off in volume, while the depressed condition of mining stocks, until very recently, had the effect of sending money to this market for investment in some of the most prominent. But a gradual restoration of confidence is doing more to ease the market than all other causes combined. A fair business is being done in nearly every line, with reasonable profit. Large stores of wheat remain to be sold, and there is some ground for the belief that the prices will soon touch the lowest point in Liverpool, leaving hope for early reaction. The temptation for English capitalists to invest in breadstuffs while at their lowest cost is too strong to be withstood. Money is abundant in England and breadstuffs are always sure of finding demand. Our merchandise markets are overstocked with Eastern and foreign goods, and but little drain will be experienced from that source for some time to come. Farmers are paying their bills with coin received for their products, and country dealers are thereby enabled to liquidate their obligations to metropolitan merchants. Mining advices show an improved condition, while our bullion receipts are increasing. All these are valid reasons to predict a growing ease in our money-market, which restores confidence and lets coin loose. We learn of no difficulty in obtaining accommodation at 1@1¼ per cent. per month, on well assured call loans, and for long periods at 12 per cent. per annum, the security being ample. Bullion is in good supply. We quote gold bars at 870@880; silver bars from par to ¼ per cent. off; currency bills on Atlantic cities are charged 237½ per cent. premium on gold; sight coin drafts pay 1@1¼ per cent. premium; telegraphic transfers are effected at 1¾@1¾ per cent. premium; sterling exchange, 483½d; commercial exchange, 49¾@49½d; Mexican dollars, nominal at 5 per cent. premium; gold in New York, November 26, 124⅝; legal tenders in San Francisco, 80@80¼. The fluctuations in the thing called paper money, erroneously attributed to gold, are something wonderful, and furnish the strongest evidence of the necessity of returning to a specie basis as soon as possible. On the 24th of September, gold was rushed up from 130 to 160, which is another mode of saying that paper had depreciated to the same extent by the manipulations of a villainous clique. On the 24th of November—only two months—gold was quoted at 124¾, which is another way of stating that paper had appreciated to a comparative extent. How is it possible for business to flourish under such circumstances? Every person dealing in currency values is kept perpetually in the dark.

The exports of Treasuro from Nov. 1st to date have been been as follows:

Nov. 4—Per America—		
To China	$1,164,338 85	
To Japan	2,000 00	
		$1,166,338 85
Nov. 1 to 4—Overland to New York		22,000 00
Nov. 5 to 11—Overland to New York		209,815 09
Nov. 17—Per Golden City—		
To England	$450,514 41	
To France	55,559 82	
To Central America	10,000 00	
To Panama	20,000 00	
		536,074 23
Nov. 12 to 25—Overland to New York		204,200 58
Total since November 1st, 1869		$2,146,468 74
Previously this year		32,531,657 85
Total since January 1st, 1869		$34,673,086 59
Corresponding period, 1868		32,179,650 91
Increase this year		$2,493,435 68

City Stocks.

The transactions in miscellaneous securities during the past week have been much larger than for some time past. We note sales of California Steam Navigation Co. stock at 47@46 per cent.; San Francisco Gas at $88; Spring Valley Water at $63; and Sutter St. R.R. (preferred) at $16 per share.

The returns of our local insurance companies to the Internal Revenue Department for the month of October, and previously this year, have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77½ cents for February and March, 75½ cents for April, 73½ cents for May, 74½ cents for June and July, 74 cents for August, 74½ cents for September, and 75½ cents for October.

	October.	*Previously this year.*	*Total.*
Pacific	$102,051	$991,504	$1,093,555
Union	32,057	370,690	402,857
Fireman's Fund	36,149	306,187	342,336
California	10,867	95,858	106,725
Merchants' Mutual Marine	24,871	233,092	267,873
Occidental	22,280	210,574	232,864
Home Mutual	15,521	131,030	146,551
Peoples'	20,122	162,917	183,039
Oriental	7,032	11,894	18,926
Total	$280,960	$2,513,856	$2,794,826
Same time in 1868	229,836	1,654,789	1,884,625
Increase in 1869	$51,124	$859,077	$910,201

The above statement shows a decrease of $29,167 from the receipts in September. The receipts of the several companies in October as compared with September show the following difference:

	Increase.	*Decrease.*
Pacific	.....	$27,052
Union	.....	9,223
Fireman's Fund	$4,036	.....
California	.....	4,705
Merchants' Mutual Marine	4,025	.....
Occidental	.....	1,676
Home Mutual	.....	1,643
People's	60	.....
Oriental	1,021	.....

The receipts of the city railroads for the month of October and previously this year were as follows:

	October.	*Previously this year.*	*Total.*
Omnibus	$24,283	$222,095	$246,378
North Beach & Mission	26,427	218,930	245,357
Central	19,770	153,670	173,440
Front Street, Mission & Ocean	9,627	83,907	93,534
Market Street	11,890	163,814	170,404
Potrero and Bay View	3,744	27,805	30,549
City	5,763	13,102	18,865
Totals	$100,204	$825,323	$925,527
Same time in 1868	89,044	745,974	835,018
Increase in 1869	$11,160	$79,349	$90,509

As compared with the total receipts in September, we find a decrease of $264. The receipts of October as against September show the following difference:

	Increase.	*Decrease.*
Omnibus	.....	$ 898
North Beach and Mission	.....	243
Central	.....	64
Front Street, Mission and Ocean	$ 306	.....
Market Street	385	.....
Potrero and Bay View	.....	285
City	525	.....

Mining Share Market.

Although the transactions in mining shares at the Stock Board have been quite large since our last similar reference, still we notice a very perceptible decline in prices of all leading descriptions. A larger number of White Pine stocks changed hands than for some weeks past, showing that the interest in those mines is gaining strength here. We also observe that capitalists from the East, upon satisfactory investigation by competent parties, are beginning to seek investments in that region; all of which evidently proves the richness of that silver-bearing locality. In this connection we make the following extracts, from the *News* of the 20th: "A gratifying improvement in the bullion shipment over that of last week is shown; the shipment for this week being $57,331.48, against $32,632.33 for last week. In September, the price of milling was reduced to $20 the ton. Since then, the price has again dropped; or at least is reduced by arrangement, so that large lots can be contracted for at $16 the ton. This accounts for the circumstance which perplexes some; namely, that the bullion shipment has not increased in proportion to the increased number of stamps. With the price for crushing reduced, mine superintendents prefer to work all ore, with scarcely any assorting. Thus the average yield of ore in mill for the last quarter was $58.59 per ton, while for the quarter ending June 30 it was $99.75 per ton. During the last quarter the number of tons of ore worked was 10,329, while for the quarter preceding the number of tons was only 4,174. Thus, we are working cheaper ore, and a larger amount of it—getting out the wealth of the mines more closely, affording more work, and consequently showing a lower average yield."

KENTUCK—has been in moderate request at declining rates. The annual meeting of this company was held on the 24th inst.; and from the Secretary's statement we take the following:

RECEIPTS.

Cash on hand, Nov. 1, 1868	$ 38,825 28
Bullion product	805,732 82
Premium on bullion	963 84
Assessments—Nos. 1 and 2	40,000 00
	$885,521 94

DISBURSEMENTS.

Reduction of ores	$374,895 45
Labor	139,095 55
Dividends—Nos. 27 and 28	100,000 00
Advance to Virginia & Truckee R.R.	75,000 00
Timber account	21,265 01
Hoisting ores	12,381 48
Mine supplies	12,920 63
Sundry accounts	70,883 28
Cash on hand, Nov. 1, 1869	79,080 54
	$885,521 94

From the Superintendent's report we copy the following comparative tables:

Year.	*Ore yield, tons.*	*Gross yield.*	*Net yield.*
1868	31,390	$1,257,563 85	$515,043 13
1869	27,876	804,732 82	178,531 70
Year.	*Yield per ton.*	*Cost of Production and Reduction.*	*Net profit.*
1868	$40 06	$23 65	$16 41
1869	28 88	22 47	6 41

"The poor exhibit of the present year," continues the Superintendent, "as compared with the results of the previous year, is mainly, if not solely attributable to the great fire which occurred in the mine on the 7th of April last, which for nearly five months caused an entire suspension of work in the principal ore-bearing localities. In the meantime all possible efforts were made by means of air-drifts and winzes, and powerful air-blasts from the surface, to reach the ore bodies on the 800 and 900-levels, which, on the 20th of August last, we succeeded in doing, and commenced extracting ore; and since that time have extracted, on an average, 130 tons of ore per day." During the fiscal year, 27,867 tons of ore were extracted—the Old West Ledge, between the 400 and 200 levels, yielding 6,667, and the East Ledge as follows: Between 700 and 550 levels, 9,500; 800 and 700 levels, 10,750; and 900 and 800 levels, 950 tons. The following named gentlemen are the Trustees for the ensuing year: J. D. Fry, (President) A. Hayward, Thos. Sunderland, A. K. P. Harmon, and Wm. Sharon. Secretary, H. C. Kibbe. Superintendent, J. P. Jones.

HALE & NORCROSS—has been in fair request at rather lessened rates. For the week ending Nov. 20th the yield from the upper mine amounted to 466⅓ tons, and the lower mine 519 tons—total, 985⅓; previous week, 1,030½ tons. On the 21st inst. Cross-cut No. 1 had penetrated the ore body 29 feet; in No. 2 they were drifting north and south on the vein, and No. 3 had been carried in 48 feet. On the 23d they were making preparations to extract ore from Nos. 1 and 2, and were running drifts to connect these cross-cuts. On that date No. 3 drift had reached the west wall, tho ore being 49 feet wide at that point. The raise from this cross-cut is now upward of 20 feet above the level. As yet but a small amount of ore has been taken from the sixth level, but hereafter about one-half the supply will come from that level.

CHOLLAR-POTOSI—has receded under large sales. During the week ending Nov. 19th, 898 tons of ore were extracted, against 874 tons the previous week. The Blue Wing locality shows considerable improvement. The drift west from the main trunk, passing through the Grass Valley ground, has come out in the old Santa Fé slope, meeting with no ore while running the drift.

GOULD & CURRY—was in the market to a limited extent at declining rates. They extracted 367½ tons of ore during the week ending Nov. 22d. At the seventh station, the cross-cuts to the west are each in 40 feet. The cross-cut from the drift going south has been carried through clay and porphyry, and the one running north is altogether in porphyry.——BULLION levied an assessment of $7 per share on the 22d inst.

ONE of the best and quickest ways to obtain large numbers of desirable immigrants on the Pacific Coast, would be to provide some reliable means for them to obtain subsistence when they arrive here.

THE "STONE GIANT" is now on exhibition in a hall in Utica, N. Y., and a scientific report on the same is expected soon.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Nov. 26, 1869.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		*Per ton*
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	76 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

THE TEMPERANCE MIRROR AND DIRECTORY, a monthly paper, will be started in San Francisco, Jan. 1st, by Harry Andrews and J. W. Mackie.

Overland Monthly for December.

Table of coutouts: In Lava Land; In and Around Astoria; Expectation; Quicksilver, and its Home; Legend of San Juan de los Lagos; Down among the Dead Letters; Nevada; Cariboo; The King of Clear Lake; Those Americans; Tea Leaves; Minna's Betrothal; For Three Weeks; Old Lamps for New; Her Letter; The Idyl of Red Gulch; Etc.; Current Literature.

The descriptive and "valuable" articles, however interesting in subject and free in execution, are apt to be skipped, sometimes, in certain moods when we would relax ourselves to the beguilements only of lighter fancies, of sentiment, humor, and the enjoyment of the simpler manifestations of the heart. In this number there are more stories than usual. Down at the bottom of the list is the simplest told and most effective, because the least elaborated in style, of them all,—"The Idyl of Red Gulch." But while it is natural and brimming with the true story-teller's humor and genius, there is conspicuous the rawness—perhaps we should say coarseness—of stories as they are told around the camp-fire. Yet there is a moral to redeem it, in the abandoned woman's solicitude for the bringing up of her son,—did not the terse, playful sentences of Saxon vigor and rudeness already suffice to make us overlook the behavior of ignoble characters. "In Lava Land,"—the first article—is by a pleasing artist in words. A Mexican legend is that of the building of the church of San Juan de los Gatos, by the aid of an irreverent giant's hands.

THE GENESEE FLOUR MILL, on Gold street, in this city, so frequently damaged by fire, is again in operation. Its apparatus for cleansing the grain from smut, separating the barley and oats from the wheat, the bran from the flour, and assorting its various grades, are beautiful and complete in every department. The consequence is that no finer flour is produced anywhere. The capacity of mill is 400 barrels per day of twenty-four hours. The machinery is run by one of Booth & Co's 85-horse engines.

PROF. THEOBALD'S lecture on Wednesday evening, upon Pope Pius IX and the Ecumenical Council to be held at Rome, Dec. 8th, 1869, was listened to with interest.

KOOPMANSCHAP says there are 3,000 employed Chinese in California. Chinamen, it has been noticed, do not usually remain unemployed long.

FRIENDLY ASSISTANCE.—Those who learn the value of our paper by reading it, will confer a favor by informing those who should become its patrons of the superiority of the PRESS as a journal for reading and advertising.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Tarshish.—*Miner*, Nov. 13th: The lower tnunel is now over 100 feet long, and from 15 to 20 feet is being added weekly. Four men were taking out ore from the upper works on Tuesday, and some very good ore has been placed on the dump this week; 40 or 50 sacks of it the soft or pocket ore. Single-hand drills are used.

Leviathan.—We saw in the hands of Mr. Mullan, some Leviathan ore which he had partially smelted in a smith's forge, showing globules of copper all over them. Mr. M. thinks this ore may be smelted on the ground. The machinery for the mine has arrived.

Noble and Hill.—*Chronicle*, 14th: After a lapse of several years, work will be resumed on this claim next Monday.

AMADOR COUNTY.

Kennedy.—*Dispatch*, Nov. 20th: The Kennedy quartz mill was attached by its creditors last Friday, in consequence of which all work at the mine has been temporarily suspended. We understand that arrangements are being made by which work will he resumed in a few days.

CALAVERAS COUNTY.

Mining Items.—Messrs. Peters, Champion & Co. are working the Union shaft claim with success. It has the position of the best gravel mine in the district. The claim is now fitted up for winter working, large sheds having been erected over the shafts....Shaw is piping away at his bank with the best results. He has one of the best hydraulic claims in the county. The pay is uniformly good....Brackett & Co. are still drifting in search of the lead which they lost. The work is slow, as the cement is hard enough to require blasting.....At the Golden Gate claim they are taking out gravel at a rapid rate, and the quality is better than heretolore....Paul & Co. are still driving their gangway with prospects as bright as ever.

INYO COUNTY.

Lone Pine.—Los Angeles *News*, Nov. 20: Yesterday Mr. John Gray arrived in town with 142 bars of argentiferous lead from Lone Pine, and a box of rich specimens for one of the mine owners now in San Francisco, who is about going East.

LOS ANGELES COUNTY.

Good Showing.—*News*, 13th: The Eureka mine, Soledad, reports 140 ounces of gold, the proceeds of eight days' run.

More Silver.—*News*, 20th: Yesterday a prospector brought to the *News* office a magnificent specimen of silver-bearing rock from a ledge which he claims to have discovered in the Coast Range, some 65 miles from this city. The silver in the rock is plainly visible to the naked eye.

Rich Ore.—Yesterday a 75-pound specimen of rich argentiferous lead was brought to us. It is from the Comet mine, in Yellow Pine district. The supply of similar ore is apparently inexhaustible. The specimen would probably assay 90 per cent. of lead and silver. One of the partners is now in San Francisco, with a ton or two of the ore, for assay. Smelting works are to be erected immediately.

MARIPOSA COUNTY.

Mariposa Mill.—*Gazette*, 19th: The company's quartz mill seems to be progressing in its work with enlivening results. The resumption of the "wet process" in crushing, proves very satisfactory; the rock now being taken out is remunerative, and the prospect continues to be excellent.

MONO COUNTY.

The Dunderberg.—Carson *Appeal*, Nov. 14th: We are informed by persons who have thoroughly examined this mine, that it shows a large body of very rich ore. Situated on the eastern slope, with an inexhaustive supply of timber near, and an abundance of water, the Dunderberg will add largely to the product of the mines on this side of the mountains.

NEVADA COUNTY.

Empire Mine.—Grass Valley *Union*, 17th: The ledge is large in the main shaft, and increases in the Rush and Laton ground. The miners are taking out the ore faster than the thirty-stamp mill can crush it. Capt. Lee contemplates employing the Orleans mill, to help crush the ore. The rock coming out in such profusion is very rich.

Hope Gravel Mine.—The company is now taking out fine-looking gravel, and undoubtedly has the regular old river lead. Unless some unforseen accident happens, the Hope will henceforth be taking in instead of paying out coin.

McClellan Mine.—Same of 20th: Thursday last a blast disclosed a portion of the ledge which shows rich. The ledge has always been heavy in metal, but until Thursday no free gold had been found. The ledge is twenty inches thick.

Discontinued.—*National*, 16th: Jousen & Co. have discontinued work on ths Bavaria ledge, Rush creek, until next spring, on account of water. They are down 50 feet, and the rock shows well in gold and sulphurets. In the bottom of the shaft they have two ledges, one 18 inches in thickness, the other one foot.

North Star.—Same of 17th: The water has been reduced to the eighth level, and within a day or two the mine will be entirely free. Ore is being taken from the 6th and 7th levels, which will yield from $30 to $50 per ton.

The Ophir.—19th: This mine, between the Empire and Heuston Hill, is owned by the Empire Co. An incline shaft has been run to the depth of 300 feet on the ledge, which is from six inches to a foot in thickness. In the first level, ore has been taken out, which will run $30 to $40 per ton. They are now going to start a new level at the bottom of the incline. Some choice specimens were taken out on Wednesday.

Union Hill.—The only company at work is the "Union Hill," which is taking out 150 tons of ore per month. The ledge is four to ten feet in thickness. They have a great deal of water to contend with. The ore looks very fair.

Hydraulicing.—*Gazette*, 17th: But a small amount of water is running in the ditches in the lower part of the county yet. The South Yuba Canal Company are running 2,000 inches to Dutch Flat, and 1,600 inches to Omega. It needs heavier rains before miners can commence operations generally throughout the county.

Lindsey.—This mine is at the mouth of Fall creek, on the South Yuba. The ledge is fifteen feet in width, and for some months the owners have been crushing the rock in their five-stamp water mill, and doing well.

New Quartz Mill.—We learn that the mill erected by Van Dusen and others on the Illinois ledge, above Washington, was started up on Wednesday. The mill has five stamps and is run by water power. The ledge is of good size, and so situated that the rock can be easily delivered at the mill. It yields five dollars a ton, and can be worked with profit to the owners.

Illinois.—*Transcript*, 16th: The Illinois mine, above Cañon creek, on the Yuba, is owned by Thomas & Co. The ledge is from twenty inches to three feet thick, and the rock shows considerable free gold. The Co. have put up a five-stamp mill, which was started for trial last week, and worked satisfactorily.

Mount Auburn.—This ledge, owned by Holbrook, on Reagon Flat, has been opened at three places, to the depth of 25 feet, and is very rich. We saw specimens in the pile in which free gold could be seen all through. The ledge is large.

Wood's Ravine.—17th: Lutje & Swarts have completed a large flume, which is the outlet for tailings from the Knicker bocker, Gentry & Co's claims, the One Horse ground and other claims. Gentry & Co. are running a tunnel for opening their claims.

The Vigilance Mine and Steam Stamp Mill.—One of Wilson's patent steam stamp mills have been set up on the Vigilance on Reagon Flat, and the battery was set in motion on Saturday for the first time. The battery consists of two stamps weighing 650 pounds each—dropping 200 times per minute. The mill will be completed this week. The hoisting and pumping is done by a twenty-four horse power engine. The incline is down 225 feet, where they have a ledge from four to seven feet in thickness, of fine looking rock. They have out now 160 tons, and it is estimated that the two stamps will crush from 20 to 24 tons every 24 hours.

SIERRA COUNTY.

Suspended.—*Messenger*, Nov. 20: Work has been suspended at the Keystone mill, owing to the trouble of keeping the workings free from water, the pumping machinery not being powerful enough. The Co. has been running a tunnel to tap the ledge low down; but it will take some time yet to complete the work.

SISKIYOU COUNTY.

Quartz on Humbug.—Yreka *Union*, 13th: Lash & Co. still continue operations on the Eliza ledge with success. The ledge, at the point where their lowest tunnel strikes it, is five feet thick and of excellent quality. At present the company labors under a disadvantage, on account of the distance from the ledge to the mill and the necessity of packing their quartz on mules. We believe it is the purpose to remove the mill in the spring to the vicinity of the ledge.

TRINITY COUNTY.

Weaver Basin.—Trinity *Journal*, 13th: The claims in Weaver basin are all ready for water. A wet season will result in a large yield of gold, the claims being in a condition to be worked to the best advantage.

Flume.—R. N. Davidson, Supt. of the Fluming Co., informs us that the flume is now secured for the winter. There are 81 boxes laid down. These are 16 feet wide, and can be boarded 10 feet high on the sides if needed. The water has been turned in. The Co. are repairing their Brown's creek ditch, leading water to Mahie's Flat. All the old flumes along the ditch are being replaced.

The Rain.—Enough water fell to raise the river and drive out those engaged in mining in its bed; but miners generally have not been benefitted.

Valuable Claim.—Carson & Osgood, after years of hard work, have been richly rewarded. Four thousand dollars in coin has been refused for one-half interest in the diggings.

Quartz.—A gentlemau well informed in such matters has been prospecting the quartz in Weaver Basin, and gives it as his opinion that there is a mineral belt ranging through the county that is capable of easy development.

YUBA COUNTY.

Oregon Hill.—Cor. of Marysville *Appeal*, Nov. 20: The Castle Bar Co. has suffered heavily in the destruction of its works by the freshet on the Yuba. The Templar Quartz, with splendid machinery, is standing idle, for want of capital and experienced miners to make it pay. The ledge has always paid pretty well. Its shares cannot now be bought for less than $2.50 per foot. The locality resembles Grass Valley in its croppings. Experienced quartz men from Grass Valley are here, prospecting the hills; and one of them has found a good ledge. At Dobbins ranch there is an eight-stamp mill, where quartz from Camptonville yielded $50 to the ton. The miners here number about 25, and they are busy getting their flumes and ditches in order for winter. Ditches and water are needed.

Arizona.

Constantia Mine.—Prescott *Miner*, Nov. 6th: Judge Cartter, of La Paz, the other day exhibited ore from a gold-bearing lode named the Constantia, which made our eyes water. The mine is 13 miles this side of La Paz, convenient to wood and water. It belongs to an incorporated company, who are negotiating for a 10-stamp mill. Thousands of tons of ore are in sight.

Dry Diggings.—Some 50 or 60 miners are at work back of La Paz, making from $3 to $30 per day, by dry washing process. Judges Cartter and Peavis tell us of seeing recently at La Paz $1,500 worth of gold that was taken out of the diggings in one week. Pieces weighing $30 and $40 have frequently been found.

Walnut Grove.—C. G. Genung and P. Smith are now ready to start their arastras on ore from the Sutler lode. Pete Smith found recently, near the Placeritas, a lode of gold-bearing ore richer by far than any yet discovered in the district. The placer miners at work in McCloud's old claim are making from $5 to $7 per day.

Lower Lynx Creek.—The miners at work at the old Mexicau camp are doing first rate. We saw some of the gold. It was coarse. They are working the bed of the creek, washing the dirt in rockers.

Rich Rock.—We saw, the other day, several pieces of as rich gold-bearing rock as we have ever laid eyes on. Every piece was chock full. The specimens were from the bottom of a 30 foot shaft in the Charter Oak lode, Hassayampa district. The vein is six feet thick; pay streak, three feet.

Panning.—Gov. Safford, while near the Chase mill the other day, came across some miners at work in a gulch, took a pan of dirt, washed it, and got about 75 cents worth of gold dust.

The Prospecting Parties.—We learn from Chas. Franklin that the Cooley party had returned to Phœnix. They prospected upper Salt river, but found no diggings. An immense quartz ledge was discovered in one of the banks. The specimens taken from it were rich in gold.

Colorado.

Mining Items.—Central City *Herald*, Nov. 3d: Woodbury & Norton's mill is running 23 stamps without intermission; 18 on Missouri ore from the Winders & Martin claim, and five on ore from the Ophir. Some repairs are going on in the Consolidated Gregory....The claim of Bennett, Wright & Co. is paying $15 per day to the man....Wm. P. Jones has one of Wilson's Steam Stamp Mills put up in the old Keith Co's mill in Black Hawk. He will start up on Monday.... The Plumb Bros. have got their new 15-stamp mill on Quartz Hill about ready to run. They will crush custom quartz....A fine body of ore has been struck in the Baker Mine, Argentine. It assays $900 per ton....Mr. Freeman is putting up a mill on North Clear Creek seven miles above Black Hawk. It will contain five stamps and five arastras. There will be extensive mining there next summer.... The Paul Jones lode in Virginia Cañon is yielding fair looking ore.

Quartz Hill.—Same of 10th: The Co's mill has stopped work to put in a new hoiler, etc. Waterman's mill, Eurska gulch, is to add five stamps, making 20.

Rising Sun Lode.—For eighteen months McNear, McGaskell & Slattery have worked with discouraging results. They did not, however, despair, and last week, 200 feet below the surface, struck a seven foot crevice containing rich pay....Shaw & Finley have a lead further west, which runs 14 oz. per cord.

Ophir.—A party of 11 men, who are working out pay due them from the Ophir Co., are taking out three cords of ore per week, which yields from seven to nine ounces per cord.

Prize Lead.—Mr Hayden's new engine and hoisting machinery are busily at work. The mine is now the best paying lead on the Prize Hill, and furnishes a large quantity of ore.

Polar Star Co.—The 24 stamps are running on California ore from the Stalker & Standley claim. Thirteen cords are run per week, with an average return of 150 ounces, or nearly twelve ounces of gold to the cord.

Dr. Hagan's Works.—*Register*, Nov. 11th: We called yesterday at these works in Mill City, and found the large furnace charged with 20 tons of ore from the Whale lode, the furnace being heated for the first time. If the Doctor succeeds in handling these, the worst ores in the county, a new era will dawn on that portion from Idaho to Empire. Stamp mills have been faithfully tried and failed.

The Tunnels.—Notes of Travel, Denver *News*, 17th: A year ago when Burleigh and Marshall began their tunnel, failure was predicted. Now, a tunnel excitement exist. Many other tunnels are being driven as fast as possible. "There can be no danger that the Georgetown mines, opened as they will be by tunnels, will ever become 'economically exhausted.' The ore will lay above the tunnels, from which levels will he run, and the rich minerals will be stoped down and delivered at the mouth of the tunnels at a cost trifling compared with deep mining by means of shafts. When these tunnels shall be driven for sufficient distances to strike the lodes at depths of 500 feet and upwards, the supply of ore which will he guaranteed will be so largely increased and the yield of bullion so great in proportion, that all our present operations will appear as nothing."

Terrible Mine.—"The first class ore is now being shipped to England. The last lot of 11 tons which was shipped to Newark, N. J., yielded a net profit of $7,584.64 currency of an average of $689.51 per ton over all expenses of mining, transportation and reduction. The average value of all the first-class ore which has been worked has been $700, on which the net profit has been not lese than $550 per ton. No second class ore is now being reduced; but last summer Mr. Stewart worked 46 tons, the assay value of which was $282.50 per ton. Of this amount 70 per cent. was saved, making the yield $197.75 per ton. The profit was not far from $100 currency, per ton."

Briggs.—The old stamps in the mill are being replaced by new ones. Twenty-five are now in operation, and 25 more will be ready to run in a few weeks. The mill formely contained 50 stamps, weighing 650 pounds, and dropping 22 times per minute. With this mill they crushed 36 cords, or 252 tons, per week. The 25 new stamps are doing the same work done by the old 50, and when the entire 50 new ones are put in operation the capacity of the mill will he doubled.

Mills.—A list is given of 29 mills, with a total of 624 stamps, crushing a total of 421 cords of ore per week. Estimating seven tons to a cord, this makes 2,947 tons crushed per week. There are some six mills not included in the list, which would make the total about 700 stamps and 8,250 tons per week.

REDUCTION WORKS OF HUEPEDEN & Co. The total amount of ore worked from January 1st to October 23d, was 506 tons, which yielded a total of $58,215.92 coin, or $72,769.90 currency. This is an average of $115.05 coin, or $143.81 currency per ton. Now this is only 80 per cent. of the value of the ore. When it is remembered that these are our second class ores, the fact will appear remarkable.

Idaho.

MINING ITEMS.—*Avalanche*, Nov. 13th: The Ida Elmore and Golden Chariot continue to furnish the usual quantity of rich ore. The recent development in the Poorman proves to be a permanent thing; the lead is widening and the quality of the ore is getting better. The Baxter, which has been lying idle, is now being worked, and indications are favorable. We saw a specimen of ore this week, the finest we have seen in camp, taken from the bottom of the shaft, which is over 230 feet deep. Reports from the Red Jacket, Peck & Porter, Allison and Potosi, are also favorable. The Twilight, at Flint, now being worked by contract, by Mr. Clark, is turning out well.

THE BAXTER.—*Ware*, 18th: The specimen mentioned last week appears to be only a forerunner of what was to come. The mine has yielded a constant supply of superior ore ever since. One piece, now in Herman & Co's bank, is perfectly dazzling with rolls of bright ruby silver standing out in bold relief from the surface of the rock. O. S. Hazard, owner of the mine, is preparing to commence crushing in a few days.

LOON CREEK.—Helena *Gazette*, 11th: A private letter from Loon Creek, pronounces it a "hilk." The ground is claimed for 2½ miles. Over 400 men are at the camp. Claims rate from nothing to $6,000. There is very little buying or selling. The largest nugget yet found weighs seven ounces.

Mexico.

SONORA.—San Diego *Union*, 11th: A new mining excitement has started up, occasioned by the discovery of rich placer diggings in Sonora. The particulars reached Tucson two weeks since, accompanied by an invitation from an officer in the Mexican army to all Americans who wish to go hither from Tucson, to come along and go to work, and he will furnish them a military guard to protect them from the Indians. Eight of our citizens left with provisions, etc., to test the value of the report.

Montana.

PARK LODE.—Helena *Gazette*, Nov. 11th: Judge Turnley informs us that a crevice of eight feet has been struck; the rock is rich, and eight miners can keep the mill running. Mr. Whitlatch had formed a company of capitalists in the East to work and develop his lodes in Grizzly and the Owyhee Park.

GOOD.—We hear good reports from Confederate gulch. Many of the claims below Diamond City have been thoroughly tested. As much as $400 to the set of timbers, of coarse gold, is the average run.

QUARTZ.—We learn that 400 men are at work on the quartz lodes at Missoula. The prospect is very flattering.

PHILIPSBURG.—Cor. of the *Gazette:* "Property that six months ago could have been bought for the value of the quartz in sight, could not to-day be purchased for 100 per cent. advance. It is said that the St. L. & M. M. Co's mill has been leased, or in other words, that the offer of the California Co. is accepted, awaiting the approval of S. T. Hauser only. Also that the machinery will be put in running order immediately. About 900 tons of quartz lies subject to their order, and as many thousand can be furnished at the shortest notice. They have sent forward an experienced amalgamator from the French mill, Nevada. The Cole Saunders Co. are progressing finely with their new works on Camp creek."

NEVADA DISTRICT.—The Virginia *Capital Times*, Nov. 15th, says: Two drain ditches are being constructed, which will cost, in the aggregate, $4,000, and, when finished, will enable the owners to throw into the channels of commerce at least half a million of dollars. This statement is based on facts and figures.

ALDER GULCH YIELD.—It has been computed that the Alder Gulch for the year ending Nov. 1, 1869, gives a total of $1,000,000. These figures, had there been sufficient water, would assuredly have been quadrupled.

Nevada.

COPE DISTRICT.

COPE MILL.—Elko *Independent*, 17th: The new mill for Cope from San Francisco has reached this place, and is being loaded on teams for Mountain City. The mill is small, but complete.

RICH STRIKE.—News reached us last night that a surprisingly rich strike was made on Sunday in the Mountain City mine. Feet are worth $50.

FINE ORE.—On Monday we saw a specimen from the Mountain City mine, weighing nearly 50 pounds, which was literally a mass of horn silver.

MOUNTAIN CITY.—Letter to the abovenamed journal: The Argenta Co. are prosecuting their work with success. Several tons of first class ore have been shipped below. In the Mountain City ledge a large force of men are employed. This mine is evidently the mine of the district. During the past week 15 tons of first and second class rock have been taken out, besides a large amount of inferior grade. Work is progressing on the Columbus ledge, Grasshopper Gulch, one mile from town; also on the Crescent, situated about a mile from town. About 50 tons of ore have been taken from these claims and sacked. The Nappitandi ledge, near the Mountain City, is said to be the largest in the district. The Sunny Hill mine is creating quite an excitement. Assays from the Bruno ledge, in Bruno District, show $384 in silver and $12 in gold per ton. The Drew & Atchison mill is almost completed. Sellers, Merritt & Co. have made arrangements for hauling rock from the principal mines to the mill, and at present have one four-horse team hauling from the Hamilton mine, one from the Mountain City, one from the Belle of the West; and on Monday they commence hauling from the Grey Silver and various other ledges. There are now about 200 tons of rock delivered at the mill, and from 30 to 40 tons arriving daily.

WYOMING.—It is said that the smallest assay ever made from ore in this district was $384.20 in silver, and $12 in gold to the ton. The ledges thus far discovered are mostly in Silver Mountain, which is back of Bruno City, on Crystal Creek, a tributary of the Owyhee.

HUMBOLDT.

GOLD RUN DISTRICT.—*Register*, Nov. 20: The argentiferous galena ores of this district are attracting a great deal of attention in San Francisco. Several new companies have commenced developing the most promising leads, and are busily engaged in preparing for winter. The hoisting apparatus on the Cumberland shaft is completed, and the Co. is extracting ore from their drifts. R. C. Chambers has purchased the Register mine, and is now erecting comfortable winter quarters.

BATTLE MOUNTAIN.—Letters to *Register:* The Avalanche has been opened within a few weeks. At a depth of 20 feet, it shows a ledge 16 feet in width, of solid mineral, and well defined walls. The ore is argentiferous galena, and yields $280 per ton in silver, and 82 per cent. galena. A one-ninth interest was sold a few days ago for $2,000, the party retaining his interest in the ore on the dump. The Shiloh, owned by McCann, Way & Co., located near the Avalanche, is thought to be even better. The ore is of the same quality as that of the Avalanche, yielding $290 per ton in silver and 84 per cent. galena. The Cherokee is a ledge recently discovered by Robert Smith, a short distance from town. The Excelsior, owned by Hughs & Co., is six feet wide, and bears chloride ore which will assay from $80 to $100 per ton. The Mammoth, owned by Dr. Everson, is 12 feet wide, and, like the Excelsior, bears chloride ore. The ledges in this district, are looking well.

PAHRANAGAT.

BULLION.—*Reveille*, Nov. 19th: Yesterday, Wilson, the General Agent of the Hiko Co., and Mr. Dawley, the Supt. of its reduction works, arrived with 22 bars of silver bullion, valued at about $25,000. It will be shipped overland to New York immediately. We were informed that the bullion is the product of 30 days' run of the 10-stamp mill. The ore was produced by the Illinois, the principal mine of the company. Our informant stated that the ore reduced at the mill ranged in value from $80 to $100 to the ton. The Illinois is said to be of large dimensions. Mr. Dawley says that assays of the entire width gave the average of $40 per ton. The mill is at Hiko, while the mines are at Silver cañon, ten miles distant. It is the object to change this if possible. For this purpose an artesian well has been commenced in Silver cañon, near the mines. The well has been bored already 150 feet.

REESE RIVER.

BULLION PRODUCED.—*Reveille*, 20th: During the fortnight ending this date there were produced at the mill of the Manhattan Co. 24,113 ounces of bullion.

MINERAL HILL.—C. McWilliams, in company with several Virginia City mining capitalists, is visiting Mineral Hill District with a view of erecting mills, if encouragement can be obtained from the owners. So says the *Independent*.

EUREKA DISTRICT.—*Reveille*, 15th: J. Bateman and Col. D. E. Buel have purchased six locations on Ruby Hill together with several mines in the vicinity. The price paid is $200,000. Six furnaces are to be erected. This district is bound to figure in the quartz market. The single furnace running, turns out about two tons of bullion every 24 hours.

WASHOE.

HALE & NORCROSS.—*Enterprise*, Nov. 21st: On the 1,100-foot level the cross-cut west of the shaft has penetrated the ore 26 feet, and has not as yet reached the west wall. Another has been run 50 feet farther north. The width of the ore in this is 28½ feet. Most excellent ore is exposed in each of these cross-cuts, but that in the one farthest north is superior. A drift was started yesterday from the northermost cross-cut, to be run in the center of the ore-body to the northern boundary of the mine. This is the most important development since 1865.

SAVAGE.—A body of excellent ore has been found, the extent of which has not been ascertained, on the seventh level in the main drift running southward, towards the line of the Hale & Norcross. They are now overhauling their old upper works preparatory to taking out the low grade ore near the top of the ledge. This will be shipped by railroad to Carson river for reduction. The works are all in good order and everything is going on smoothly. The main shaft is down eighty feet below the present lower level.

OPHIR.—The Co. have still 250 feet of water in their shaft. The new engine is in operation. Two hoisting tanks are kept in constant operation, but the pump is idle, as the plunger pump is out of order, and being under water, cannot be repaired until the water has been lowered below the point where the trouble exists. The water comes from the old mine, and when it is once bailed out, there is no doubt that the pump will keep the shaft drained.

OCCIDENTAL.—Quartz resembling that in the principal mines on the Comstock has been found in the lower tunnel. It is supposed that the edge of the ledge has been cut. The body of ore in the north end of the mine is found to be extensive. The usual quantity is being taken out.

BELCHER.—The usual amount of ore is being taken out from the old works. A small vein of quartz and pay ore has been struck on the 730-foot level. They are drifting and cross-cutting on the 850-foot level.

VIRGINIA CONSOLIDATED.—The shaft is down 420 feet, and the rock continues favorable with no increase in water. At the depth of 500 feet they will begin drifting.

SIERRA NEVADA.—The usual amount of ore is being taken from the surface workings, and drifting is going on below in fair quartz.

SUTRO MINE.—Work is about being resumed in this mine, on the north side of Cedar Hill. Although Mr. Sutro may have been the locator of the mine, we believe that at present he is not interested in it.

CALEDONIA.—The new shaft is down 100 feet and drifting for the first level has commenced. Some fine looking quartz has already been encountered.

IMPERIAL-EMPIRE.—They are a good deal troubled with water, but are making fair progress, the shaft being down 1,182 feet. Drifting is progressing on the lower level.

YELLOW JACKET.—Last Thursday they made their first shipment of low grade ore by railroad to their mill at Empire City, on Carson river. It consists of seven car loads from the 700-foot level of the old north works and will probably mill $18 per ton.

SUTRO TUNNEL.—The small tunnel or "header" (six feet square) was in 173 feet last evening. During the past week they have made seven feet every 24 hours.

SEGREGATED BELCHER.—A deposit of ore assaying $200 has been found in the 500-foot level.

GOULD & CURRY.—Drifting is still going on in the seventh level, and the usual amount of ore is being extracted from the old works.

KENTUCK.—The good yield is continued, and a dividend of $10 per share was disbursed day before yesterday.

CHOLLAR-POTOSI.—The new hoisting works will go into operation in a few days. From the old works they are taking out 125 tons per day.

FIRST ORE SHIPPED.—Gold Hill *News*, 19th: The lot of ore from the Yellow Jacket shipped over the railroad yesterday to the mill on Carson river was from the 700-foot level of the old north mine, and dumped directly into the cars, the railroad passing within a few feet of the shaft. It is ore which heretofore was considered too poor to work.

DAYTON BULLION.—Same of 22d: The Dayton stage, brought up 1,448 pounds of crude bullion this morning. It was from the following mills. Birdsall, 1,048 pounds; Rock Point, 300 pounds; Reservoir, 100 pounds.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, 20th: The work goes bravely on. The splendid weather is being taken advantage of to haul from the mine dumps every pound of ore that the supply of horse flesh is equal to. The mine product of Treasure Hill is now sufficient to sustain a greater population than the three towns have. But times are dull. The bullion is turned out at so light an expense for mining and hauling that the gross product does not encounter sufficient friction—as by wages of men—to be much advantage to general business. Capitalists hire ten men to work a mine which on the Comstock would require 100 men. The bullion is shipped to the cars at a cost probably 60 per cent. less than it could be from the Comstock.

BULLION.—*News*, 20th: Total for the week $57,331. The price for crushing is now $16 per ton. Hence the reduced average yield of the ore, for now the mine superintendents work it without assorting.

MILLS AND FURNACES.—*News:* A number of additional small furnaces are going up, and we hear of arrangements under discussion for working on a larger scale even than the White Pine Smelting Works at Swansea. These works are turning out about six tons of bullion daily. They are running on ore from five or six different mines. The assay value of the bullion is about $75 in silver to the ton. D. A. Spraker, of Shermantown, has just broke ground for the erection of a set of works in that place to consist of two large furnaces, each four feet in the clear. *Empire* says: The White Pine Smelting Co. shipped last week 255 bars of bullion, weighing 22,345 pounds. A gentleman from Freiberg is constructing an improved furnace in this city, which will be ready to fire up next week. Work on the Chicago mill is progressing finely. Most of the framework is up, and the workmen are preparing for the machinery, the last of which is expected from Elko in a few days.

ITEMS.—*News*, 20th: Wm. Latimer has arrived from New York to introduce the Diamond drill. A new era in prospecting is promised us....Aurora Consolidated ships 80 tons ore to mill daily. Ore at 114 feet depth improves greatly....Work on Constitution progresses finely....Domingo ships 10 tons first class ore daily....Empress Josephine, Base Range, has a thin but rich vein, worth $100 per ton silver, smelted....Imperial gives three or four tons same kind. Gil. Dorland does not smelt it, but sells it on the dump at $25. ....Pritchard has a 25-ft. shaft....Little Giant mill constantly running on ore from the Pogonip & Othello. Has turned out $5,000 in bullion this week....Sierra Pasco ore works $86....Truckee is looking better. Twenty men this week have taken out this week 15 tons first class ore, and 40 tons second class. Last lot worked gave $136 per ton, .996 fine....*Empire*, 21st: Original Hidden Treasure looks better than ever. Force increased to 40 men. A new shaft has been started to tap the ledge 50 ft. down.

New Mexico.

MINING ITEMS.—Colfax *Telegraph*, Nov. 13: Maxwell's new 15-stamp mill, on ore from the Montezuma lode, nets $1,000 per day....The tramway from the Montezuma to Maxwell's mill, will be completed this week, ready for the wire rope, which is expected next week, with fifteen additional stamps....At Orleans Flat, Mr. Pease, with a rocker, is taking out $20 per day. ....The Michigan Co. are opening a new cut on Michigan Gulch. The same company are at work on Grouse Gulch, with success.

Oregon.

CANON CITY.—Dalles *Mountaineer*, Nov. 9th: Mining has not been unprofitable this summer. The lack of water has prevented some of the mines from being worked; but energy has been displayed in opening up claims, which have amply repaid. The Chinamen have been working claims on Cañon creek, hitherto considered worthless, and have sent considerable money into circulation. Parkers & Winters' claim at Parkersville, in the Burnt River District, cleaned up $17,000 in a two weeks' run.

San Francisco:

Saturday Morning, Nov. 27, 1869.

Notices to Correspondents.

"Rebellious Ores and New Processes," by C. H. Aaron, in type.

"Mining Notes from Placer County" are unavoidably postponed until next week; also some notes on the Eureka mine, Grass Valley.

Icon will appear next week.

T. J. C., Central, Col.—The Hagan furnace is not in operation here.

The Gold Hill Fire Still Burning.

The terrible and fatal fire which broke out in the Gold Hill mines on the 7th of April last, and which resulted in the destruction of a large number of lives, is still smouldering. After it had been reduced to close quarters, it was carefully walled in, and work was again started in different directions around it. It was thought to have been extinguished long ago; but such, it appears, is not the case, for a few days since some miners working between the 600 and 700-foot levels of the Kentuck mine suddenly picked through into a space where there was plenty of fire, finding large brands of it. The place was at once closed up again. Being as far as possible shut in and kept from the encouragement of atmospheric air, the fire merely smoulders, but it is there, nevertheless, and may keep on burning for many months to come. It can do no particular harm, however, as it is merely burning out the old timbering where the mine has been worked out.

Winter on the Railroad.—Both the Union and Central Pacific Railroad Managers affirm their belief that no material hindrances from snow on the tracks need be apprehended in the future. The experience of last winter, and the preparations which that experience has suggested, they hold, will prove ample for all emergencies.

Gone East.—Mark L. Winn, inventor of the shampooing apparatus recently illustrated in this paper, has gone East by rail, where he will make arrangements to have his apparatus manufactured. He will return shortly with a sufficient number of his machines to supply this market.

The Washoe Stock Board.

Again there is plenty of life and much to do between brokers, speculators, and owners in mining stocks. These words—"mining stocks"—refer with us always to Washoe. The quotations from the Board contain as a rule only the names of the Virginia and Gold Hill mines—a fact not by any means going to show that other districts in California or Nevada are not paying equally honest dividends in the sought for metals.

An *active* stockboard is, of course, the direct result and evidence of activity in the mines whose stocks are dealt in. The kind of activity has less to do with quantities of rock mined or milled, than with sudden changes in prospects of doing better or worse. Therefore, we may find some of the best managed and best producing, as well as best paying mines, little quoted or referred to in the stock columns.

The every-day trading and "transactions" are of no great general importance. The mining stock-dealers are organized into something like a great game, which seems to interest them very much, for they have their money—all of it as likely as not—staked, upon their own peculiar card, or trick. The latter consists in possessing especially clear, or exclusive knowledge: 1. Touching the situation or management, or new development of the mine in question, bearing upon a yield of million above the expenses. 2. The existence, or probabilities, or possibilities of new combinations in the company's stockholders, whereby, 3. The operations of mining or milling may be differently controlled, in such a manner as to give the parties controlling the opportunity to derive subordinate extraneous advantages and profits out of the *expense* account, in the way of—the thousand and one methods that are so easily practiced.

This amusement is even more respectable than playing at two bit euchre in respectable families to late and sometimes early hours. The rule of success is, as in the latter case, also a hiding of your own hand; a reading of your neighbor's hand by his movements, and by seeing through his intentions to deceive, yourself in the issue deceiving and euchreing him; but quite as often (when sufficiently tempted) the rule is to deceive the individuals on whose behalf you are playing, a matter at the same time very easily done, and covered up, in such a mysterious, sharking game, as speculative dealing in mining stocks.

The late rise in Washoe stocks is amusingly transparent and curious in its effects upon the sharp and intelligent faces of prim and seedy-looking men who are daily seen to congregate at the corner of Montgomery and California streets. These dealers, and agents, embody a very large share of the intelligence of our mining interest. They are doing much stirring, which works toward the development of our new unworked territories of untold wealth. The spirit of the community evidently commends and sustains them. They certainly do right in profiting as much by their transactions as they can, for who would not nab a fortune in a day? Persons who are, or wish to be engaged in legitimate mining, need not be interfered with; for that is quite a different trade.

The foundation for the late "improvement in mining stocks," is the discovery of some new bodies of ore in the central part of the Comstock vein, principally in the Hale & Norcross mine. This is about the point where the chimney and stockwork character of the northern row of Comstock mines begins to change into the sheet deposits, characteristic of the Gold Hill portion of the vein.

The latter is the true vein character, to be depended upon for regular and continuous mining; it contains a lower average of metal, but worked in quantity may yield quite as largely, and more surely, than even the chimney deposits. The new rich deposit struck in the cross cuttings of the Hale & Norcross is, according to the Secretary of the company, whom we have questioned on the subject, "different from anything that they have ever had," containing, we are told, a great deal of wire silver. But whether it is of the chimney or of the sheet character; whether the Comstock lode and ore as now developed in depth, promises to be uniform or of such a character as to admit of the formation of any further sound practical deductions relative to the future dividend value of "feet" in that region, nothing transpires to throw any additional light. "A rich body of ore" struck, is, of itself, an old story.

The Awards at the Chilian International Exhibition.

English manufacturing is so largely dependent upon its foreign markets that much more attention was given to the conquest of the Chilian field by English agricultural manufacturers at the Santiago exhibition of last April, than by those of the American Atlantic States, whose ample market is to the rear of them. Nevertheless, there were some good articles from the Eastern States, as specimens of the American method. The American steam thrashing machines on the Pitt system, being very light and cheap,—made of wood wherever possible,—found many patrons, but received only the second prize. The American wood and steel plow has hitherto been the standard in Chili; it was the cheapest plow in the market; yet the prize went to an English plow, on its merits for lightness of draught, durability, and quality of work done.

The firm of Ransomes, Sims & Head took the grand gold medal and $800 prize for the best general collection of agricultural machinery; also first prizes for steam thrashing machine, portable steam engine, and plow; while Hornsby & Son (English) came out first on reapers and drills. On plows and harrows in general, J. & F. Howard's were the best. Don Santiago Prado took the $500 prize and gold medal for horses and cattle. California does not seem to be represented on the prize list.

The Darien Ship Canal.—The telegraph of Monday says a Government steamer has been detailed to proceed to Panama, to assist in the survey of the proposed ship canal across the Isthmus. It is stated that a treaty has been received giving to the U. S. Government sole control over said work. This looks very much like business. The United States as well Europe must have a new and shorter ocean way to the Indies. It is especially opportune that the telegraphic dispatch noted above should appear simultaneously with the telegram announcing the successful opening of the Suez canal.

Delegation from Lick's Orchard. Five boxes of mammoth apples, peare, and quince, accompanied with the proper credentials as representing a very populous community of like stripe and flavor, reached our office a few days ago from the orchard of James Lick, flourishing at Santa Clara. They have been tasted, and are pronounced fit representatives of Santa Clara. The "Spitzenbergs" were exceedingly large and fair, and not excelled by any apples we have ever tasted.

For Amador, Calaveras and Tuolumne Counties.—Wm. H. Murray, our traveling agent, will soon visit the above named counties, offering persons a convenient opportunity to subscribe and pay for the Press.

The Official List of Premiums awarded at the recent exhibition of the Mechanics' Institute is published on pages 346 and 347. It is the first full report of awards published.

Profits and Losses of Two Methods of Mining.

Of late it has been common to hear the remark (a true one) that "mining stocks were never so low as they are now, nor anything like it." The lowest ebb and the subsequent rise is shown in the following table taken from the *Bulletin's* commercial column of November 12th:

	Sept. 30.	Oct. 30.	Adv.	Dec.
Alpha.....per share.	$10	$14	$4	—
Belcher.....	13	14	1	—
Bullion.....	16	16	—	—
Chollar-Potosi.....	14	17	3	—
Confidence.....	30	25	—	$5
Crown Point.....	14	12	—	2
Empire Mill.....	15	18	3	—
Gould & Curry.....	67	77	10	—
Hale & Norcross.....	114	139	25	—
Imperial.....	29	35	6	—
Kentuck.....	174	165	—	9
Occidental.....	9	13	4	—
Ophir.....	12	16	4	—
Overman.....	70	122	52	—
Savage.....	35	45	10	—
Sierra Nevada.....	7	13	6	—
Yellow Jacket.....	33	41	8	—

What Mount Davidsone of bullion have the brokers bore extracted? A million and more. See what amounts of paper bullion, that nevertheless represent the same amount of precious metal in our stock-dealers' control—by the following exhibit of the profits of stock mining for the month of October. On the whole number of shares represented by the above companies severally, the gain in market value stands thus:

Alpha.....	$24,000	Occidental.....	$40,000
Belcher.....	10,400	Ophir.....	67,200
Chollar-Potosi....	84,000	Overman.....	166,400
Empire Mill.....	3,600	Savage.....	160,000
Gould & Curry....	48,000	Sierra Nevada....	90,000
Hale & Norcross...	200,000	Yellow Jacket.....	192,000
Imperial.....	24,000		
Aggregate appreciation.....			$1,109,600
Loss in Confidence.....			$17,800
Loss in Crown Point.....			24,000
Loss in Kentuck.....			18,000 59,800
Net appreciation in 17 descriptions.....			$1,059,800

This is more than the mines, or the army of miners with all their hard labor, have been able to bring forth to the surface in the same space of time. The profits are decidedly in favor of mining in the stock board, as a business, and going comfortably to the Lick to dinner, and to the California Theater of an evening.

But there is another feature of stock mining, which is worthy of incidental note. For the first ten months of the year the monthly loss and gain on the foregoing descriptions have been as annexed:

	Gain.	Loss.
January.....	$809,700	$122,640
February.....	322,000	427,980
March.....	406,480	733,000
April.....	1,446,380	278,800
May.....	1,470,400	522,900
June.....	106,120	2,374,500
July.....	69,560	1,255,000
August.....	68,000	1,209,540
September.....	12,500	1,544,960
October.....	1,109,600	49,800
Totals.....	$5,840,740	$8,519,120

Losses above gains, $2,678,380. These losses are likewise real losses to individual owners, often in cash. What is the cause of such losses? Of course, that the "mines are not yielding enough to keep up the stocks." Mining "don't pay," referring now, as a matter of course, to legitimate mining, for every one knows that stock mining in general pays well, the commissions at least, plus occasional handsome strikes. The losses go to the account of those who own in some of these mines that figure in the stock boards, and who do not make stock mining their special business.

Yet the Virginia mines have been producing, quietly and regularly, during October, and every preceding month of the year as during former months when stocks were deemed at high tide.

The Virginia *Enterprise* thus states the case: When the stockholders of San Francisco were driven by their business necessities to throw their Washoe stocks upon the market three months ago, the inference was that the bottom had fallen out of Nevada. The result was a panic, or little short of it, and immense losses for the time being to *those* who had faith enough to purchase and hold.

Mines certainly would not be worked—no more than a railroad could be run—if they were not paying somebody more than the money that is being put in. But there is one class to be excepted—the mines that are worked solely to trap fools in the stock market.

Observed Changes of Level on the Pacific Slope.

The "cataclasms" of the Bible and of theoretical geology—the astounding results of dynamic change exposed to view in the shape of upheaved mountains, Yosemite gorges, and ten thousand shapes now grand and beautiful,—evince a tendency to carry the thinking mind of man back to an age of terror, and to feed, if not create, superstition. In one sense, superstition is a virtue, for it is the laying of a sort of foundation for riper knowledge of nature around us, and of Him who created. Popular philosophy prefers to believe that everything has been "hove up." There are belemites found scattered over the surface, and sticking in the rocks in numbers, little bolts that do not belong to or look like any living created thing ever seen, —and which must have been the very arrows that were fired to and fro in those days of havoc, when the devils had it all to themselves in their own quarrelsome, infernal way.

Geology, embracing all the other sciences, and bearing most directly of all upon the destinies of man, loves to trace in things to be observed around us in the present, as far as possible, the same causes and operations that in the Creator's hands, gave to us the foundations of the earth to dwell upon. We need imagine nothing whatever. None of the original causes or operations have been suspended. We can even descend to, and witness with mortal eyes, the earth's internal fires, in the molten lake of the crater of Kilauea. We can read as easily and unerringly as we do the pages of a book, the successive formations that envelope the old plutonic rocks like the peelings of an onion, to our particular standpoint on the surface, where we are scraping the soil, or burrowing in the crevices for metals.

Reference has frequently been made to observed changes of level that are going on on this coast and elsewhere. An inch of change in a century is a mile in a little more than 50,000 years—a brief "day" in geology. While the eastern coasts of the North American continent are known to be sinking, and the western oscillating or rising, from Chili to British Columbia, there are to be noted with special care and exactness, local variations, or oscillations, periodical and regular or otherwise.

The student of the geological history of California may find something that is to the point and suggestive in the following communication stating a few facts, the purport of which in regard to our local geology need not be enlarged upon by us at present. Prof. Whitney's survey records the Cretaceous and Tertiary rocks, in the same region along the foothills, as a little out of level, dipping westwardly. Such facts have undoubtedly something to do with the formation of the auriferous gravel courses of the pliocene and post-pliocene rivers that once drained the golden western slope of the Sierra Nevada. Geographically, the line of alteration in level observed by our correspondent, is fixed by the summit of Mt. St. Helena in the Coast Range, and the Marysville Buttes; about N. E., and nearly at right angles to the coast line at this point:

FORBESTOWN, Butte Co., Nov. 8th.

DEAR SIR:—You will remember, when I was in San Francisco, in September, of my telling you that on the spot where I built my house some seven years since, one peak of the Marysville Buttes appeared to be higher (without reference to the exact altitude) than the summit of the Coast Range immediately beyond. On the fourth of September last, to my astonishment, the same peak of the Buttes, from the same spot, appeared to be on a level with the Coast Range, and I at the time called the attention of others to the fact. My brother, who is also certain that one peak of the Buttes was formerly above the summit of the Coast Range, on September 5th walked with me down the hill to a spot about seventy-five feet below the foundation of the house, before we could make the peak of the Buttes as much above the summit of the Coast Range as formerly. This afternoon—November 8th—I could distinctly see from my door the summit of the Coast Range *above* the highest peak of the Buttes. I have never done so before, and the change in level has been the subject of frequent observation and remark with me within the last two months. Moreover, I walked down the hill to the spot where I and my brother stood two months since, and the highest peak of the Buttes only appeared on a level with the summit of the Coast Range beyond, and a still further walk down the hill to a spot some seventy-five or a hundred feet lower, only made the highest peak appear as it did two months since, or as it did formerly at the house. I have never taken any observations with instruments to ascertain the exact amount of depression of the Buttes, or elevation of the Coast Range and Sierra Nevada, but am certain there has been an alteration in the level of the points named, which also appears to other observers. The altitude of the location of my house is about 2,300 feet—the distance to the Buttes about thirty-five miles on an air line—to the Coast Range, from 130 to 150 miles. Yours truly, F. A. HERRING.

Electricity and Crystallization of Metals.

Daniel Breed writes from Washington to the *American Artisan*, that John Corson has just got a patent for the making of iron of a superior fibrous structure by insulating it during the process of manufacture from electrical earth currents. He is an old California miner, and says he has observed that gold was "generated" in the tailings of worked-out mines, and that such generation or deposition was more abundant in gulches running east and west,—or parallel to the earth currents,—than in those running north and south,—or transverse to such currents. So he concluded that electricity was the cause of the crystallization of metals, and in 1867 received a patent for the use of electricity in crystallizing gold. He now proposes to insulate metals to prevent crystallization. He insulates the furnace, forges, anvils, rollers, and other machinery, and also the floors, tools, and all appliances where iron and steel are manufactured or stored; likewise railroad tracks, bridges, buildings, and all structures made of iron, in order to produce and preserve a superior fibrous condition.

Perhaps the occurrence of the gold in gulches running east and west could be accounted for in some other manner.

A PARK FOR SAN DIEGO.—San Diego wants a park, where its future overcrowded population can stroll at its leisure and get a breath of fresh air. An area of 1,480 acres has been set apart for that purpose, and yet the people complain that the grounds are too small! London and Paris are satisfied with 500 acres each; but San Diego, being about to become the terminus of a Continental railroad, is, of course, a city of large expectations, and should be gratified.

DEATH OF A CALIFORNIA INVENTOR.—Zenas Wheeler, late of this city, died in Melbourne, Australia, on the 15th of August last, at the age of 53 years. Mr. W. was a native of Maine, came to California in 1848, and soon after located in Grass Valley, Nevada county, where he was well known as a mechanical engineer. He was among the earliest of our inventors to introduce pan grinding into quartz mining, and his name has for the last six or eight years been prominently connected with this class of mining machinery.

SOME military gentlemen went over to Saucelito on the 18th inst. to try the Remington rifle for soldiery, with a view to getting the Governor and military authorities posted as to the effectiveness of some of the new improvements. The results were considered highly satisfactory. The representative of the invention was A. E. Crane.

New Books.

THE CANDY ELEPHANT and Other Stories for Children. By Clara E. Dolliver. Illustrated. 12mo; pp. 236. New York: Published by A. Roman & Co., 1870.

Miss Dolliver is a common-school teacher in San Francisco, and one of the class of young ladies who could afford to be "ugly," though we do not believe that she is anything of the kind. Woman are so strangely constituted, or mon's judgment is so perverted, that lines of character in their faces are usually considered, or *are* out of place. They were not made to wrinkle their sweet faces with thought, nor to do anything but sow, and cook, and nurse their babies; and between those three employments the young and handsome must, in a few years, be transformed into crooked-backed, spinally ailing, roasted, wriukled or shattered, *ugly*, oldish women. Such is the theory and the practice. But women can be out-door bodies, and can show character as well as men; and they do it in some of the best literary works of modern times. Miss Dolliver's book is a good specimen of a woman's writing. They have a way, of getting around all dullness, and will take you through regions of vivid coloring, giving you, in their own peculiar way, the pith of a volume in a few sentences. Women are "Frenchy" in their habits of presenting things—that is, the French, rather, are femiaine in their way of talking and writing. On certain subjects a woman's handling is superior, and far more attractive to the general reader, than a man's; and such subjects are those in the collection of stories before us, the first of which gives the title to the book. The "Candy Elephant" was the nickname of Miss Em's little brother Bobby, and the story tells most pleasingly all about the child getting lost in the rain on a Thanksgiving day, and being sought for and believed to be drowned by Em. and Mr. Heath (who afterwards marries Em). The boy, on a visit to Em's one day, strays away and does get drowned. She remembers Bobby's words when she found him on that Thanksgiving day: "Don't cry, Em."

The illustrations are very superior, as well as the printing. The stories are all Californian in tone and location; amongst them are several happily conceived fairy stories; and as a Thanksgiving and Christmas book, though intended for children, it is well worthy of the spare hours of older people. The price is $1.

OPTHALMIC SURGERY AND TREATMENT; with Advice on the Use and Abuse of Spectacles. By John Phillips. Chicago: Western News Co., 1869. Ill. 8vo; pp. 512. Received from and for sale by A. Roman & Co., San Francisco.

In the eye and its perceptions and capabilities as the chief organ of the soul, man approaches most nearly to the omniscience of the Creator. Spiritualists, and sickly people with unnatural longings, are not satisfied with natural perceptions, and would adopt other means of guidance, even in some of the most important matters of life, seeking to see and know without this intermediation. Let them arrive at the desired results in the natural and appointed way just as far as it will suffice—and that is a great deal farther than will Psychology, or Spiritualism in any form. The faculty of seeing is something wonderful, and noble, for it is superior to bodily sensation. It is the language of intelligence. What impalpabilities of soul and of the immortal enter into and play around the eyes!

A student of eye diseases as a specialty—a thorough student—at once becomes one of the most perfect examples of a benefactor that the whole range of human pursuits can afford. Quackery will not answer here.

But as oculists cannot be supported everywhere, the general practicing physician is often necessarily called upon to serve. This work is intended to give him all the aid of all the newest developments in eye surgery. It seems to cover the whole ground conscientiously. The price at Roman & Co's is $5.

MANUAL OF THE HAND LATHE: Comprising Concise Directions for Working Metals of all kinds, Ivory, Bone, and Precious Woods; Inlaying by Veneers, and various methods practiced to produce Elaborate Work with dispatch and at small expense. By Egbert P. Watson. Illustrated. 8vo; pp. 136. Henry Carey Baird, Philadelphia, 1869. Price $1.50; by mail free.

The author, one of the former editors of the *Scientific American*, presents this work as the result of his own experiences, having himself practiced turning with the enthusiam and love of an amateur. The tools and methods are well illustrated, and the style is very concise and clear. The hand lathe, or foot lathe, which means the same thing, is a universally useful machine, adapted to use in homes and families, by ladies as well as by gentlemen, out of work hours as well as in, for ornament quite as much as for useful purposes. Some of the most beautiful ornamental turning ever done, was by Miss Holtzapfel, and other German ladies use the lathe with great skill. It is a cheap and simple machine, that will save persons of mechanical taste many an item of expense. The whole ground of wood and iron turning is covered in Mr Watson's work. Publisher's price $1.50, by mail free.

THE PAINTER, GILDER, AND VARNISHER'S COMPANION: Containing Rules and Regulations in everything relating to the Arts and Painting, Gilding, Varnishing, Glass Staining, Graining, Marbling, Sign Writing, Gilding on Glass, and Coach Painting and Varnishing; Tests for the detection of Adulterations in Oil Colors etc.; and a statement of the diseases to which Painters are peculiarly liable, with remedies; and an Appendix, on Colors and Coloring, Drying, Modes and Operations, together with Chevreul's Principles of Harmony and Contrast of Colors. Henry Carey Baird, Industrial Publisher, No. 406 Walnut street, Philadelphia, 1869.

This very essential work—to every painter— has already been noticed by us. The publisher's price is $1.50, sent by mail free of postage.

New Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR THE WEEK ENDING NOVEMBER 16th.

WOODEN PAVEMENT.—Phinehas Howard, San Francisco, assignor to J. S. Josselyn, W. B. Lake and B. F. Josselyn, same place.

PROCESS OF REDUCING REBELLIOUS ORES. A. I. Frick and J. B. Le Clerc, San Francisco.

FIELD HAY PRESS.—E. J. Marsters, Shaws Flat, Cal.

BEVERAGE.—Constantine Nessi, San Francisco.

CHAIN ELEVATOR AND BUCKET.—John A. Ball, Grass Valley, Cal.

GANG PLOW.—W. J. Boyce and Geo. W. Haines, Maine Prairie, Cal.

HARVESTER AND THRESHER.—W. G. Davis and Levi T. Davis, assignors to D. McCreary, J. B. Davis and L. T. Davis, McMinnville, Oregon.

WASHING MACHINE.—Herrmann Cramer, Sonora, Cal.

CABINET FOR LADIES.—J. Forbes, San Francisco.

PINS NOT MODERN.—A collection of twenty-five pins has recently been placed in the Louvre, Paris, which were found in the subterranean vaults of Thebes, and must have been made more than 3,000 years ago. They are very well made, and differ but little from those now in use. Ladies' hair pins have likewise been found under similar conditions, almost precisely like those which the ladies of the present day employ in fastening their hair.

RUSSIA LEATHER is called by the Russians themselves "jucteu." It is usually dyed red with aromatic saunder's-wood; and is especially valuable for its property of keeping free from mould, when exposed in damp situations, and in being proof against the attacks of insects. It even repels such annoyances by its odor. It is useful in preserving books, when employed as a portion of the binding material.

A FATAL EXPLOSION of the manufacturing works of the Giant Powder Co., located between St. Mary's College and the Industrial School, nearly five miles from the City Hall, San Francisco, exploded and buried last night killing two men and seriously injuring others, including six Chinamen.

A GOOD INVESTMENT.—The woolen mill at Marysville has declared 33⅓ per cent. and 100 per cent. stock dividends after two years of operations. Its capital stock was increased from $50,000 to $100,000.

RED DOG HAS GONE TO YOU BET.—Business houses, families, offices, everything. Red Dog is no more; in short, the "dog is dead."

Award of Premiums.

[*Official Revised List, Seventh Exhibition of the Mechanics' Institute—Furnished specially for the M. & S. Press.*]

MEDALS.

INSTITUTE MEDAL.

Pacific Rolling Mill Co.

INVENTOR'S MEDAL.

A. G. Waterhouse, rotary mechanical power.

GOLD MEDALS.

Kindleberger & Arnold, blind shade tenoning machine.
J. D. Arthur & Son, bent-axle gang plow.
California Powder Works, blasting, rifle and hunting powder.
A. S. Hallidie, patent suspension bridge.
J. S. Phillips, portable assaying machine.
San Francisco and Pacific Lead Pipe and Shot Works, pig lead, leadpipe, drop shot, etc.
Jouathan Kittredge, Californuia safes.
Pacific Saw Manufacturing Co., saws, pruning knives, reapiug machine sections, etc.
Elam & Howes, wooden ware.
Pacific Glass Works, assorted glassware.
San Jacinto Tin Co., samples of tin ore, pig tin, block tin and tin ware.
Pioneer Paper Mills, colored and other papers.
Black & Miller, hacks and top buggies.
Main & Winchester, display of harness.
Goodwin & Co., best average general display of furniture.
Strahle & Hughss, laurel palace and California woods.
Toby Rosenbal, oil paintings—Exile's Return and Joys and Sorrows of Spring.
P. Mezzarra, artistic merit in statuary of California manufacture.
George A. Brush, imitation laurel, walnut and oak.
Jacob Zech, square piano.
Capital Woolen Mills, blankets and flannels.
J. R. Nickerson, best displ ay of apples.
Thomas Varney, amalgamating pan.

SILVER MEDALS.

G. T. Pracy, steam engine governor.
Berry & Place, Blake's steam pump.
J. T. Ford, hook and eye machine.
Berry & Place, planing and matchiug machine.
C. F. Travis, French burr mill stones.
J. W. Sutton, rotation dynamometer.
Hawley & Co., Marsh's harvester.
George W. Taylor, steam quartz battery.
T. Locher, working model of steam plow.
San Francisco Cordage Co., samples of manilla cordage.
A. S. Hallidie & Co., wire rope and cord.
Liddle & Keading, California-manufactured breech and muzzle loading sbot guns and telescopic target rifles.
Asphaltoliu Pipe Co., asphaltoliu pipe.
E. N. Robinson, specimeus of roofing, slate and flagging.
John Roach, transit, theodolite and leveling instruments.
V. W. S. Parkhurst, Howe's staudard scales.
Folleau & Mabon, snrgical appliances, artificial legs and truss s.
National Watch Co., Elgin watches and movements.
Pbelps Brothers, California-manufactured bolts, nuts, screws, etc.
N. W. Spaulding, circular saws with Spaulding's patent teeth.
Brittan, Holbrook & Co., japauued and copper wars.
H. T. Graves & Co., wire goods.
W. T. Garratt, brass work.
M. Fulda & Son, mammoth wine cask.
Korbell & Brotbers, California veneers,
Johu Mallon, specimens of glass cutting.
M. Clark & Son, California stoneware.
Whittier & Fuller, mirror silvering.
Pacific Oil and Lead Works, paints and oils
Mrs. C. Cook, hair jewelry.
Pacific Plate Works, gold and silver plating.
Saratoga Paper Mills, straw wrapping paper.
D. Hicks & Co., book binding.
Kimhall & Co., display of California carriages.
O. F. Willey, light open buggy and turndown phaeton.
Larkins & Co., no top buggy aud Concord spring buggy.
Stone & Hayden, display of harness and team collars.
Manasse & Baker, display of tanned leatber and skins.
P. Kelly, boots and shoes.
M. M. Cook & Sou, leather belting and hose.
N. P. Cole & Co., Californuia manufactured cabinet work,
Dana & Codington, California mauufactured curled hair.
Samuel M. Brookes, still life paintings, 77 and 78.
G. J. Denny, marine oil painting.
F. Serigni, superior penmanship and drawing.
James Lick, ornamental frames, clock case and gilded glass plates.
John W. Cherry, gold letters on glass.
Noble & Gallagber, embossed, enamelled and ornamental gilding on glass.
Miss Marion Blanchard, wax work.
Jacob Zeeb, upright piano forte.
Kohler, Chase & Co, Mason & Hamlin's cabinet reed organs.
Eureka Manufactory, wadding, batting and comforters.
Orcgon City Woolen Mills, samples of cassimeres.
K. Meussdorfer, hats.
H. Liebes, furs.
Ed. Muller, silk culture.
L A. Gould, apples, pears and grapes.
D. L. Perkins, 146 varieties of seeds.
D. Ghiradelli & Co, chocolate, broma and cocoa.
Brignardello, Michaevello & Co, farina, Italian paste and vermicelli.
Boston Cracker Co, crackers, cakes, etc.
F. Seibert, red wine and brandy.

DIPLOMAS AND CERTIFICATES OF MERIT.

CLASS I.—Section 1.

H. J. Booth & Co., horizontal steam engine, diploma.
J. T. Ford, miniature steam engine, oer.
G. T. Pracy, 8-inch engine, with fittings, dip.
H. B. Martin, double acting oscillating steam engine, dip.
Michael Lawton, model of steam engine, dip.
T. W. Burns, Taylor oil burner, dip.
J. W. Bowker, spark catcher and smokc killer, dip.
Edwin Squires, 1-horse power steam engine, dip.
David Stoddardt, Pickering governors, dip.
Fuller & Co., Johnson's oqualizing steam heater, dip.
J. L. Constable, patent steam packing and piston, csr.
Troadwsll & Co., Hoadley's portable steam engine, dip.

Section 2.

A. Meycrs, Leffsl American double turbine, dip.
Fuller & Co., Bodine Jonval wheel, cer.
D. Stoddart, Cameron special steam pump, cer.
D. Stoddart, Sewell & Cameron's fly-wheel pump, cer.
W. D. Hooker, hand pump, cer.
W. H. T. Clark, hand pump, cor.
Hanscom & Co., Hayes' steam pump, dip.
Baker & Hamiltou, Earle steam pump, cer.
V. Cushing, Excelsior hand pump, dip.

CLASS II—Section 1.

Kindloberger & Arnold, double acting blind wiriug machine, dip.
Otis Jackson, endless or band saw, dip.
Pilkington & Laue, Excelsior wood saw, dip.
Geo. A. Day, jig belt saw, dip.
Geo. T. Pracy, upright drill, cer.
T. D. Young, sngine lathe, cer.
Wm. Sellers, (Pbiladelphia), bolt cutting machine, dip.

Section 2.

J. W. Quick, quartz smutter and shaker screens, dip.
A. S. Hallidie, improved grip pulley, dip.
B. P. Ridsr, model of brick macbine. dip.
A. Williams, model of brick machiue, cer.
Atwood & Bodwsll, Excelsior windmills, dip.

CLASS III.

Hanscom & Co., foundry and cupola in operation, dip.
W. H. Hepburn, amalgamating pan, dip.
Thompson Bros., Patterson's patent forge, dip.
Porter & Collins, quartz crusher and duster, cer.

CLASS IV.

Treadwell & Co.. Russell's threshing macbine, dip.
H. G. Pratt & Co, Eagle hay press, dip
L. L. Sawyer, Finlayson's seed sower, dip
Baker & Hamiltou, sweopstake horse fork, dip
Hunter & Weister, grain separator, cer
M C Hawley & Co, Buckeye mower and reaper, with self-raking attachment, cer
M C Hawley & Co, Burdick's national hay cutter, cer
Ives Scoville, side hill plow, cer

CLASS V—Section 1

Lloyd & Stewart, improved anchor, dip.
I E Thayer, model of pilot boat, cer
Murdock & Campbell, model of pilot boat, dip
James Houseman, model of yacht pilot boat, dip
John E Kennedy, model of propeller screw, dip
B Reiley, set of hinged row locks, dip
O T Stacy, steering apparatus, dip.
L D Herrick, metallic life boat, dip.

Section 2.

A J Plate, hunting rifles and shotguns, dip
Wm Rudolph, improved gun lock, dip.
Potter, brooch-loading gun and projecttiles, dip.
Church & Clark, fireworks, dip.
W T Garratt, two brass 2-pound cannon, cer.
Cranmer & Holden, revolving battery gun, dip.

Section 3.

P. Portois, earthquake-proof chimney, dip.
Pacific Wood Preserving Co, specimens of prepared wood, dip.
W Lynch, Lynch's improved reflector, dip.
M. Clark & Sou, sewer and water pipe, cer.
B H Freeman, stair work, dip.

CLASS VI.

Lundborg & Marwedel, case of telegraph instruments, dip.
California Business University, telegraph instruments, cer.
Fairbanks & Hutchinson, platform and counter scales, dip.
A. E. H. Braun, trusses, dip.
Mrs. M. A. Suydam, patent cornea restorer, dip.

CLASS VII.

J. Perham, stove-pipe shelf, cer.
George Rubens, saucepan cover, dip.
John McLeod, combined latch and lock, cer.
John Nestor, weatherboarding tool, dip.
F. T. Houghton, petroleum stoves, dip.
Charles Otto & Co., case of brass and plated hardware, dip.
Henry Axtell, two pairs wire cutters, dip.
A. L. Stemson, Westlake patent lanterns, dip.
American Saw Compauy, samplos of perforated saws and movable teeth, dip,
C. H. Foster, substitute for brass hinges, dip.
J. B. Owens, coal oil stoves and lamps, cer.
Standard Soap Co., snbmerged coffee pot, cor.
Matthsw Cooke, giaut wedges, dip.
Weed & Co., brass goods, dip.
M. Price, cutlery, dip.
Joshua Gray, samples hroom, solder, piano covering and hook and eye wire, dip.
F. B. Lamb, stovs-handle and household tool, cer.
Kindleberger & Arnold, reversible loose joint butts, cer.
Carl Hinz, moulding tools, d'p.
Garvey & Kimball, steamboat aud house bells, dip.
John Bobu, stoves and fixtures, dip.
L. D. Herrick, Hendrickson's chimney top and Herrick's sprinkler, cer.
Root & Nye, gas fixtures, dip.
Cassin & Proctor, patent funnel, dip.
Will & Finck, hotel aununciators, dip.
W. T. Garratt, California-made hells, dip.
J. H. Culver, improved calipors, dip.
H. Vail, iron planes, dip.
C. O. Bagley, window-blind fastener, dip.
Loyd & Tetlow, patent sewing needle, dip.
Tay, Brooks & Backus, japanned ware, dip.
Wm. H. Woods, steam cylinder cocks, dip.

CLASS VIII.

Thomas J. Hall, willow ware, dip.
I. E. Thayer, stick of laurel timber, dip.
Figer Brothers, hrushes, dip.
S. P. Taylor & Co., hrooms, dip.
E. A. Stockton, washing machine, dip.
D. G. Lswis, mangle and wringer, dip.
Jacob Wbitney, washing macbins, cer.
F. W. Arnold, casks, barrels and kegs, dip.
Miss M. P. Carpenter, fluting machine, dip.

CLASS IX.

S. & G. Gump, mirrors, dip.
A. S Hallidie, plumbago, dip.
Thomas O'Niel, samp.es of cut glass, dip.
Haynes & Lawton, chinaware, dip.
R. A. Swain & Co., fancy goods and cut glass, dip.
Albiou Pottery, pottery ware, dip.
Son & Briggs, meerschaum pipes, cer.

CLASS X.

J. J. Knowlton, ink, dip.
S. Pillsbury & Co., Mme. Balcear's washing fluid, dip.
S. Pillsbury & Co., Paropa Rosa's toilet companion, cer.
S. Pillsbury & Co., liquid laundry blue, cer.
Cordillera Silver Mining Co., rare and costly minerals, cer.
G. P. Rose, collection of minerals, cer.
George Pheiffer, model cabinot, cer.
Hugo Mabnz, aniline dyes, dip.
Pacific Match Factory, block matches, oer.
M. Lebatard, Russian inflammable balls, cer.
George Heuter, ocment, varnishes, sealing wax, etc., dip.
Dana & Codington, oil and glue, dip.
Hucks & Lambert, axle grease, dip.
Standard Soap Co., variety of soaps, dip.
A. Golsh, California safety matcbes, dip.
Crane & Brigbam, sulphate of copper crystals, dip.
Vichy Water Co., vichy water, dip.
Napa Soda Co., Napa soda, csr.
Pacific Congress Water Co., Pacific congress watsr, csr.
J. F. Fuggazzi, perfumery, cer.
Biggs & Gardner, display of ores, dip.

CLASS XI

J. C. Hilton, stencil dies and steel figures, dip.
San Francisco Plating Works, nsw and old ware plating, dip.
Geo T Casebolt, plated carriage lamps and trimmings, dip.
John J Joiner, metallic signs and engraving on metal, dip.
George M Wood & Co, door plates and seals, dip.
F M Trueworthy, stencil plates and impressions, dip.
Dr D S Hutchiuson, specimens of mechanical dentistry, dip.
Geo W Patch, samplss of stencil work, cer.

CLASS XII.

Cubery & Co, spscimens of printing, dip.
A W Stott, card engraving, dip.
Geo B Hitchcock, lstter press and display of books, dip.
H H Bancroft & Co, law blanks, gold pens, etc, dip.
Paul & Linforth, Russell's Eureka combination printing cass, dip.
A. L. Stemson, patent check cuttsr, dip.
Burgess & Stratton, patent music folios and music files, cer.
Henry White, travelers' scrap book, cer.

CLASS XIII.

Lawton & Co., milk wagon, dip.
Paul Frievhofer, brewery wagon, dip.
George R. Cramer, dumping wagon, cer.
Wm. M. Betts, carriage springs, dip.
A. W. Burnham, two buggy woods, dip.
S. L. Pereria, railroad springs, dip.
Wm. H. Hughes, tire upsetter, dip.

CLASS XIV.

Mrs. Whiting, portable wheel cap, dip.
Edward Galpen & Co., Saratoga trunks, dip.
H. Behrendt & Co., sole leatber trunks, dip.
L. Price, boots and shoes, dip.
Broderick & Kast, boots and shoes, cer.
Malone & McMahon, tanned skins, cer.
Lawless Brotbers, ladies' saddle, dip.
B. Falck, leather frames, baskets, etc., cer.
Mrs. A. D. Baker, leather bracelets, etc., dip.
Mr. Barr, (Sacramento) California saddletrees, dip.

CLASS XV.

Mrs. H. E. Morton, reception chair, oer.
Thornton & Westlsy, sofa bed and bed bottom, dip.
Strahle & Hughes, billiard table, dip.
Blythe & Wetherbee, pyrographic wood, dip.
A. Litzins, California easy chair, dip.
Geo. O. Whitnsy & Co., display of imported furniture, dip.
Lazzaro Castagnino, two specimen tables marqustrie work, dip.
L. L. Sawyer, California improvod window shade, cer.
Jones & Wooll, gilt mantle mirror frames, dip.
Deroms & Strout, enclosed bed, dip.
A. J. Forbes, pet of boudoir, cer.
Jacob Schreiber, imported garden furniture and store stools, cer.

CLASS XVI.—Section 1.

Samuel Walker, portraits, dip.
John Wilson, landscapes, dip.
Robert E. Ogelby, crayon sketches, 56 & 57, cer.
Geo. H. Burgess, Pencil Drawings, cer.
Norton Bush, tropical sketches and bay of Panama, cer.

Section 2.

California Business University, practical commercial penmanship, dip.
Mallon & Boyle, glass staining, dip.
Jas. E. Wolfs architectural drawings, dip.
Mrs. H. S. Hutchinson, medley picture, dip.
Joseph S. Mitchell, marble picture frame, dip.

Section 3.

Sweet & Gadsby, imitation of marble and wood, dip.
James W. Lunny, lettering on glass, cer.

Section 4.

Mrs. M. E. Doherty, hair work, dip.
Mrs. Swanton, moss work, dip.

D. Dennechaud, artificial flowers, dip.
Mrs. Richard Brown, skeleton leaves, dip.
Mrs. May, bouquet of skeleton leaves, cer.
Mrs. Bennett, wax work, cer.
Mrs. S. A. Sanderson, moss work, cer.
Mrs. A. de Yonng, pin picture, cer.
Mrs. J. J. Daggett, shell frame, cer.
Miss Winnifred White, picture in sea moss, cer.
Miss Emma Blanche, wax cross and wreath, dip.
Miss Mary Pennie, wreath of California poison oak, cer.
Mrs. J. Widie, beaded pin cushion, cer.
Mrs. F. B. Medena, 2 shell wreaths, cer.
Miss Kate Mitchell, picture and frame made from California leaves and flowers, cer
Miss Nellie Welty, 4 pieces bead work, cer
Mrs M G Coffin, wreath of sea moss from Alaska, cer
H Kahn, case of artificial flowers, cer
Mrs V E Howard, boquet of artifical flowers, made from eilk cocoous, cer

CLASS XVII

F B Schoestein, orchestrion machine, dip
A A Rosenberg, California publication of music, dip
M W Willis, case of brass band instruments, Louis Schreiber's patent, dip

CLASS XVIII.—SECTION 1.

A Hahne & Co, Pioneor factory, wadding, batting and comforters, dip
Alexander Mackay, rag carpeting, dip
W D Perrin, Sacramento, samples of California flax in plant and fiber, dip
Main & Winchester, robes and blankets, cer
Geo. Macy, rag mats, cer

SECTION 2.

S. Figel, boys' clothing, dip.
Joseph Figel, boys' clothing, cer.
Norcross & Co, regalia and embroidery, dip.
M. Ettinger, friuges, trimmings and cords, dip.
H. R. Cabery, Chicago, Masonic jewels and and regalia, dip.
Pacific Pioneer Paper Collar Co, paper collars and cuffs, dip.
Pacific Straw Works, straw goods, dip.
R. M. Adams, hats and caps, dip.
Pacific Necktie Factory, cer.

CLASS XIX.

Mrs. Fanny P. Chandler, knit bedspread, dip.
Mrs S E Holliister, knit bedspread, cer.
Mrs Schrinor, crochet bedspread, dip.
Mrs H Robson, crochet bedspread, cer.
Sarah E Hoadley, bedquilt, dip.
Miss Lizzie Martin, Joseph's Coat of Many Colors, bedquilt, cer.
A H Suplee, Affghan, dip.
M Peterson, affghan for carriages, cer
Mariah Sutherland, tapestry picture, "Crowning of Queen Esther," dip
L H Bailey, worsted pictures, cer
Mrs A Van Dusen, down capes and trimmings, dip

WALTHAM WATCHES.
Let every one who wants a Watch, read this carefully
Especially if in some remote out-of-the-way place.
Now that the railroad is open, we propose to give the residents of California the opportunity of getting single genuine Waltham Watches at the
Lowest New York Wholesale Prices.
We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or
REFUND THE MONEY.
As an indication of the Prices, we will quote one Watch from our list. The P. S. BARTLETT, Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,
$28 in Greenbacks, or about $20 in Coin:
All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,

[Special Notice.]

Winn's Patent Shampooing Apparatus

By the use of the apparatus here shown, the unpleasant mode in which the operation of shampooing is usnally performed, is converted into a neat and tidy process, very effective and decidedly agreeable. By the aid of this apparatus, the head is washed and scrubbed in a hath of water, of any desirable quantity or temperature, and the employment of which, upon the top of the head, is productive of the most delightfully agreeable sensations, such as impart an entirely new feature to the process of shampooing. The apparatus is tasteful as well as suhstantial in its constructiou; and its use is equally as effective when applied to the long,flowing hair, as worn by the ladies, as to the shorter hair of gentlemen's wear.

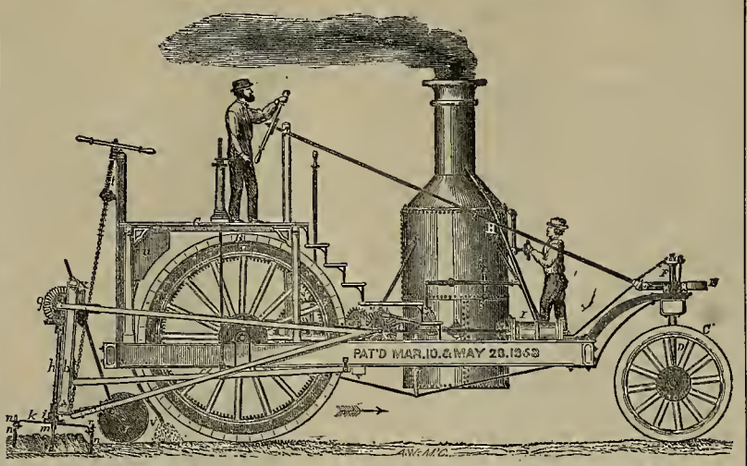
To form this apparatus, a rim or hottomless pan is first constructed, with a gutta percha lining so devised and provided with an elastic strap, as to fit tightly around tho head, below the priucipal part of the hair. The drapery or curtain, which is seen to fall helow the rim, is both for ornament and use; it serves to conceal from view the somewhat unsightly straps, lining, etc., which form the water-tight joint hetween

the head and apparatus thereto applied, and a subsequent olastic gutter, which is strapped tightly about the head, at the extreme lower part of the hair, to catch any water which may possibly escape from the main apparatus. As seen in the engraving, each has a flexihle tuhe appended, by which the water may be carried off to a sink or other suitable receiving vessel, so that the person will have no occasion to leave his seat during the entire operation, or even to remove his neck-tie.

The soap-suds or any other shampooing fluid which may be employed, is poured upon the top of the head, within the rim, after it has been properly adjusted, and a hrush or mop, or sponge, or any other suitable instrument, is theu employed within the hody of the liquid to clean the head and hair. The liquid is readily discharged through a stop-cock and the tube shown in the rear, and fresh water for rinsing applied, as often as may be desirable. Standards, with curved rests or supports, placed upon the shoulders, and adjusted by screws upon the top, all shown in the engraving, are affixed for the purpose of taking the weight of the apparatus and a portion of the weight of the water from the head. The flexible rim which adjusts the apparatus to the head makes this device practicahle.

Previous to putting on the rim an elastic strap is placed around the head to hold up the hair intended to he included within the rim, when it may be properly washed and cleansed. This arrangement is particularly useful and indispensable in fact, in shampooing the head of a lady with flowing hair. This combined apparatus renders the process of shampooing as easily and as readily performed for a lady as for a gentleman. Mr. M. L. Winn, of this city, the inventor and patentee, exhibited his apparatus and the practical employment of the process, in the Mechanics' Fair, and will soon open a saloon iu this city. The patent was ohtained by the M. & S. Press Patent Agency.

The Standish Patent California Steam Plow.



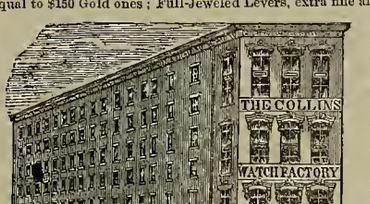
Capacity, from FIFTEEN to THIRTY Acres per day. The success of this invention for plowing large fields, is established beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of cultivating their farms, are invited to call upon the inventor, PHILANDER H. STANDISH, or address him by mail, Box 17, San Francisco. Single Machines for sale. Also, State rights, and patents for England, France, and Russia.

$10. $15. $20. $25.

THE CELEBRATED IMITATION GOLD HUNTING WATCHES,

"Collins' Metal" (Improved Oroide).

These justly celebrated Watches have been so thoroughly tested during the last four years, and their reputation for time and as imitations of Gold Watches is so well established as to require no recommendations. Prices—Horizontal Watches, $10, equal in appearance and for time to Gold Watches worth $100; Full-Jeweled Levers, $15, equal to $150 Gold ones; Full-Jeweled Levers, extra fine and superior finish, $20, equal to $200 Gold ones.



We have just commenced making a very fine American Watch, full-jeweled, patent lever, chronometer balance, adjusted to heat, cold and position, 4¾ ounces down weight, equal in appearance and for time to a Gold Watch costing $250. We charge only $25 for these magnificent Watches. All our watches in hunting cases, gents' and ladies' sizes, chains, Collins Metal, $2 to $8. Also, all kinds of jewelry, equal to gold, at one-tenth the price.

CALIFORNIA DIAMONDS SET IN GOLD.

We are now making jewelry of the California Diamonds. These are real stones of great brilliancy and hardness, and cannot be distinguished from the genuine stones, even by good judges. They are particularly brilliant at night by artificial light, do not scratch or become dull by use, and retain their brilliancy for an indefinite time. The following are the prices:

Ladies' and Gents' Finger Rings, single stones, one carat weight.....$5 each.
Gents' Pins, single stone, according to the size of the stone.....$4 to $6.
Ladies' Cluster Pins.....$7 50.
Ladies' Cluster Earrings.....$7 00.

TO CLUBS.—Where six Watches are ordered at one time, we will send a seventh Watch free. Goods sent by express to be paid for on delivery.

BERRY & PLACE, 112 and 114 California st., San Francisco.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London. [3v19-6m

AN INTERNATIONAL EXHIBITION seems likely to be held at Washington in 1871. Gen. Grant subscribed $5,000, and over $125,000 has already been secured to the fund.

THE Helena (Montana) *Gazette*, of October 22d, states that a boiling spring has been discovered in the vicinity of the Big cañon of the Colorado, which throws a stream five feet in diameter to a height of 100 feet!

APPOINTMENT.—Our Agent, Mr. J. A. Sullivan, is authorized to act as agent for the *Mining and Scientific Press* in this county. We wish him success in his journeyings around the country.—*Calaveras Chronicle.*

THE Amador *Ledger* has commenced its 15th volume. Springer is a veteran printer and a popular publisher.

To Advertisers.

After January 1st, 1870, the latest hour for receiving mining and other advertisements for the M. AND S. PRESS will be during Thursday evening, as our paper will be printed for the interior mails on Friday morning.

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, have just issued a neat little volume of over five hundred well executed wood cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the M. & S. PRESS office, postpaid, for $1.—*New Age.*

BOOK ON EARTHQUAKES.—A Treatise on Earthquake Dangers, Causes and Palliatives, by Prof. Thomas Rowlandson, comprising Earthquake Dynamics; Earthquake Waves, Sound that attends Shocks, Lime, Mortar, etc., Cosmogony and Scismogony, Phenomena of the Neapolitan Earthquake of 1857, and General Observations respecting Structural Arrangements. Published by Dewey & Co., Mining and Scientific Press Office, San Francisco, 1869, containing 96 pages. Price 50 cents, postage free.

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

THE EYES are the most precious of all organs For that reason they should be used carefully and treated scientifically. At the first sign of failing application should be made to MULLER, who will supply a pair of spectacles which will make old eyes as good as new. *

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

A NEGLECTED COUGH, cold or sore throat, which might be checked by a simple remedy like "*Brown's Bronchial Troches*," if allowed to progress, may terminate seriously. For Bronchitis, Asthma, Catarrh and Consumptive Coughs, "*The Troches*" are used with advantage, giving oftentimes immediate relief. Singers and public speakers will find them also excellent to clear the voice and render articulation wonderfully easy.

THE PAIN KILLER is both an internal and external remedy.

THE PAIN KILLER should be used at the first manifestation of cold or cough.

THE PAIN KILLER.—Don't fail to keep it in the house ready for use.

THE PAIN KILLER is an almost certain remedy for CHOLERA, and has, without doubt, been more successful in curing this terrible disease than any other known remedy, or even the most eminent and skillful physicians. In India, Africa and China, where this dreadful disease is ever more or less prevalent, the PAIN KILLER is considered by the natives, as well as by European residents in those climates a SURE REMEDY.

THE PAIN KILLER.—Each bottle is wrapped with full directions for its use.

THE PAIN KILLER is sold by all druggists and dealers in family medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. no6

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons,

Sore Throat, Sudden Colds, Coughs, Etc.

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24v18-4w

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction,

10v18 6m B. F. HOWLAND.

RETURNED.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

T. B. WINOARD, Secretary.
San Francisco, Nov. 8, 1869. no27 1w

Pilot Mining Company—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of November, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room No. 7, 423 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Monday, the third day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighteenth day of January, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. M. HARRON, Secretary.
Office, Room No. 7, 423 California street, San Francisco, California. no27

Mining Notices—Continued.

Alleghany Consolidated Gold Mining Company, Location of Works: Sierra County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-fourth day of September, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
W H Tompkins	9	1500	$450 00
A L Whitney	32	185	55 50
Charles Adams, Trustee	12	1000	300 00

Blasting Accident.

A Smartsville correspondent of the *Appeal* says: On Thursday last, Professor Hafenegger, Mr. Leszinkey, chemist, and Mr. Klause, of the firm of Charles W. Klause & Co., San Francisco, agent of the Hafenegger Powder Company, San Francisco, arrived here with a full supply of material to test the efficiency of their powder in blasting rock. They called on Mr. O'Brien, Superintendent of the Pactolas Company, who introdnced them to the contractors on his tunnel, with whom they made arrangements for the contractors to drill certain holes as they directed, which was done—the powder men to load and discha.ge the same. On Friday two holes were discharged, which proved satisfactory. Three more holes were prepared for operation on Saturday. The powder being used in tin cartridges, they had to be made. Everything was not in order in time to load and fire on Satuiday, and was postponed until Sunday morning, when in tamping, or preparing the cartridge in the drill hole, a premature explosion occurred, killing Mr. Klause instantly, tearing off a portion of his head and one arm. Mr. Herman Smith, one of the contractors, who was assisting, was so terribly mangled that he expired in two hours. Mr. Leszinkey, the chemist, is dreadfully bruised and cut up, and one eye destroyed; legs, arms and sides terribly cut up. Dr. Asay being at home at the time, has taken charge of the sufferer, with the hope of his recovery.

MANUFACTURING

Room to Let.

We have a large room, about 18 by 36 feet, in second story at 414 Clay street, near Sansome, which we will rent very low, suitable for printing or manufacturing purposes

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET.
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermitent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the velnous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*: Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought or 50 cents per dozen. 25v18tf

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequalled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Chalice Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Heater, Condenser and Filter, Combined.

BOILERS, HIGH AND LOW PRESSURE,

Pump, Pipe and Sheet Iron Work of all kinds; Quartz Crushing and Amalgamating Machinery, including High and Low Mortar for wet or dry crushing; Furnaces for roasting ores; Horn, Wheeler's, Patton's, and Belding's Amalgamating Pans and settlers; Hendy's Concentrator; Hungerford's Concentrator; Hunt's Grinder; Blake's Crushers; Stamp Shoes and Dies of the best white Iron; Russia Iron Screens, etc.; Flour Mill and Saw Mill Machinery in every variety; Hendy, Gang, Saw Mill, Pumping and Hoisting Machinery; Excelsior Force Pump, for domestic, ship and mining use—the simplest and best in use; Iron and Brass Castings of every description; Steamboat Repairs; Boiler Making executed with despatch. Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & EOKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eekart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eekart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 5- or 50 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

H. J. BOOTH & CO.

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular **Boilers**, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v15tf

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

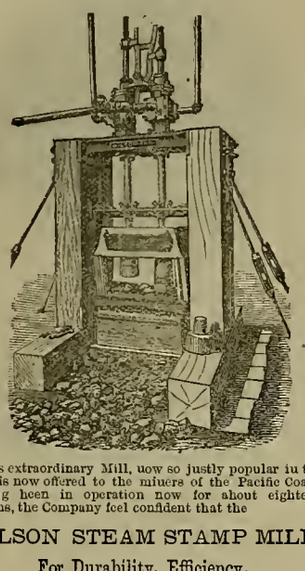
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,

1v1 San Francisco.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

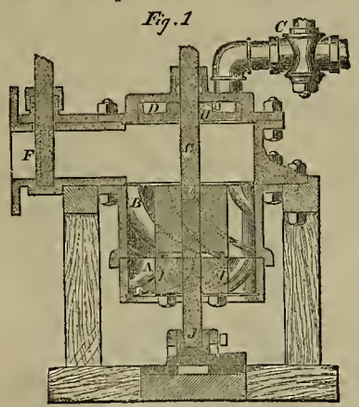
A. BICKNELL, Agent,
Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular. **A. LIND, Millwright,**
Pacific Iron Works, San Francisco.
Refer to John Sime and J. J. Haley. 19v19

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec.* 19.

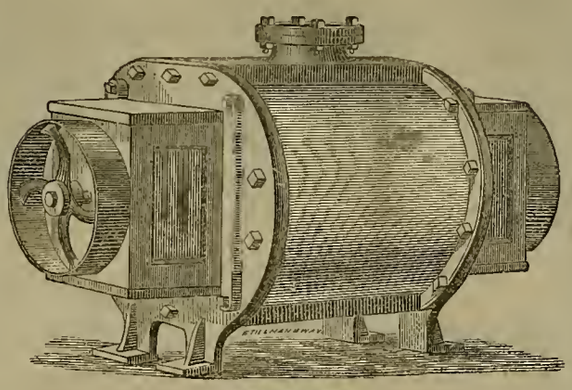
ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

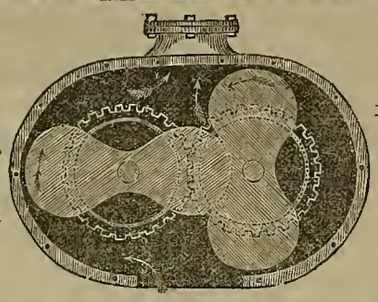
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All new patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveies, throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

The Illustrated Collision—The Fine and Black Arts.

The Mining and Scientific Press, *News Letter*, and *Police Gazette*, have had their "special artists on the spot" of the late smash-up, and with various effect. The Press has a very cleverly executed cut, but what is best, it is quite correct—that is, so far as the cars and engines were concerned. There is no attempt at showing the dead and wounded, with the employés jumping with hair on end. It is a picture from the "scientific" standpoint, we presume, showing the effects of force and motion; a sketch calculating and proper as to place and purpose.

The *News Letter* has attempted to "draw it fine," but succeeded so well in an important particular that we "can't see it"—or couldn't on the spot, in this instance. * * The execution of this picture is somewhat in keeping with much of the humor of the journal in question—like moonshine on a snowbank; pleasing to look at, but too cold for good nature.

But *how* can we describe that black spot in the *Gazette?* * * This is an execution in leather, and would take the medal anywhere. The thing looks as if it had been executed during hot weather and was in a fearful state of decomposition. * * For a pegging-awl sketch, perhaps, this sort of illustration may do; but on the whole, we think the artist had better finish himself with a bare bodkin.—*Oakland News.*

Land Speculators.—Senator Stewart, of Nevada, who has recently returned from a visit to the southern counties, tells the commercial correspondent of the *Union* that there is scarcely an acre of land of any value in any of these counties, except such as was covered by Mexican grants or settled by old residents, but has been gobbled up by half a dozen individuals in San Francisco. The Senator's words were: "They own the whole country." The idea of taxing the people of the State to bring purchasers or tenants for these lands is very cool, to say the least.

Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:
United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco. Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunion, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,

Sheffield Scientific School
Of Yale College, New Haven, Conn.
This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.
The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology. and 7—Select Course.
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.
Tuition, $125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

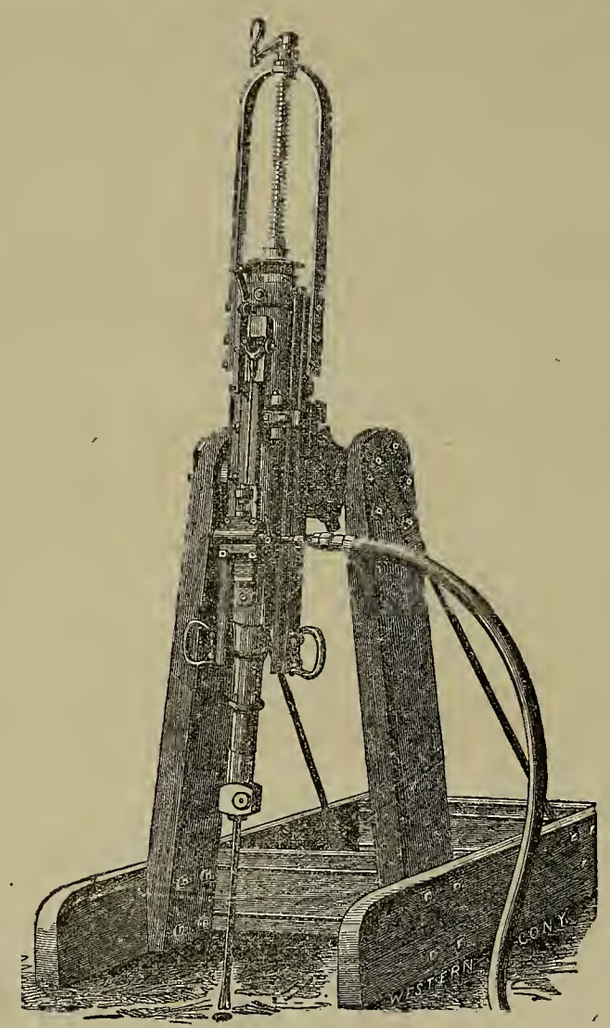
Burleigh's Pneumatic Rock-Drill.

The saving of labor and the consequent saving of expense is not the principal advantage of many new inventions. The saving of time is often of much greater importance. In some localities—in New York City, for instance—it takes months to blast away the rocks, which not only occupy the space to be used for cellars and sewers, but often rise to the height of thirty or forty feet above the level of the ground. With the assistance of the drill, which is the subject of this article, the same amount of rock may be removed in as many weeks, as months, by the old method, and that with a less number of workmen. This is, of course, of great importance in a city where the houses are occupied as soon as completed, and where impediment to travel by the building of sewers is a public loss to be avoided as much as possible.

The Burleigh drill has been in use for some three or four years in the Hoosac tunnel, Mass., and was described in the PRESS in 1868, since which time it has been much improved. When mounted singly they appear, in form, similar to a large heavy painter's easel, as shown in the accompanying illustration. The place for the picture upon the easel is occupied, in this case, by a cylinder and piston, which may be worked directly by means of steam, or by air compressed by the means of a steam engine placed at any distance required. For drilling in the open air, this steam boiler may be placed near the drill, and the steam employed at once; but for working in the shafts of mines or tunnels, it is more convenient to have the boiler outside, connected with an engine compressing the air. The air is then, by means of tubing, conducted to the drill. The small amount of loss, which is only about 15 per cent., occasioned by the use of this medium, as a means of transferring the power, is fully compensated for by the utility of the escaping air, for the purposes of cooling and ventilation. At the Hoosac tunnel, these drills have been in use for more than three years, and it is doubtful whether without their assistance this gigantic work could ever be accomplished. The boiler and engine for compressing the air are outside the tunnel, at a distance of one and a half miles from the point where the drills are worked. Eight of these are worked at one and the same time. The escaping air contributes greatly to the comfort of the laborers, and removes at once all gases, etc., that result from the blasting operations. The drill is attached directly to the piston-rod, with which it moves up and down, exactly on the principle of that class of steam-hammers. It may be made longer or shorter according to the necessities of the case. During the operation, which consists in striking the rock at the rate of from 150 to 250 blows per minute, the cylinder, piston, and drill are automatically advanced or lowered by means of a screw, in accordance with the amount the drill penetrates the rock, forward or downward, the drill being rotated at the same time.



BURLEIGH'S PNEUMATIC ROCK-DRILL

Five sizes of these drills are made, drilling holes from 1¼ to 5¼ inches in diameter; the sizes generally used are those from 1 to 2¼ inches. Thirty-six inches in depth can be drilled without a change of drill-points. We ought to add that in these drills, the steam required for each amounts to about three-horse power, with a pressure of fifty pounds to the square inch.

The Engineering and Mining Journal, in noticing this machine, mentions as follows: "It has been decided to use these drills in the work of removing the obstructions in Hell-Gate channel, New York. The idea is to work upon a plan similar to that employed at Chicago in working the tunnel underneath the lake for providing water for the city, only in place of the clay which there forms the bottom of Lake Michigan, and which can be cut, as it were, like cheese, we have all rock to be excavated. Near the shore, a large coffer-dam or caisson is being sunk, and the soil removed until the rock is reached. Then the boring and blasting will commence, and go on until a sufficient depth has been reached, whereupon the process of tunneling under the rocky bottom of Hell-Gate will commence by means of the Burleigh drill. After the middle of the proposed channel has been reached, ramifications will be made in different directions, blasting material will be placed in the main tunnel and all its branches, and all of it exploded at once. It is expected that the whole reef will be scattered and fall into the deep recesses adjoining, clearing a channel of at least twenty-five feet depth of water, so that even the Great Eastern would be able to enter New York harbor by way of Hell-Gate, as well as by Sandy Hook. We ought to add that the above-mentioned plan is that of General Newton, the accomplished United States Engineer in charge of the improvements."

Mr. A. W. Von Schmidt claims to be the originator of this idea, as set forth in his plan for the removal of Blossom Rock in our own harbor, and accepted by the Department.

The Burleigh rock-drill is now in successful operation in New York, Chicago, Jersey City; also at the Hoosac Tunnel (Mass.), Lake Superior, and Nova Scotia mines, Union Pacific and Boston & Hartford Railroads; also in deepening the beds of the Illinois and Michigan Canals, and Des Moines Rapids, and numerous other localities. Our leading mining companies will do well to examine the merits of these machines for use in their mines at an early day.

The patent rights for the Drill and Air Compresser for the States of California, Nevada and Oregon, are represented by William M. Greenwood, San Francisco, to whom communications on the subject may be addressed.

Nitro-Glycerine Explosion.

The recent explosion of 1,300 pounds of nitro-glycerine at the Giant Powder Manufactory, near this city, of which mention was made in our last issue, proves to be the severest which has occurred upon this coast. Three persons were killed—Mr. Bussenius, the Superintendent, a teamster named Cook, and a Chinaman. Mr. Wallerweiller, Assistant Superintendent, and five Chinamen were severely wounded. The grounds on which these works stand comprise about an acre of land, which is enclosed by a board fence. There were five buildings in the enclosure, every one of which was completely demolished; the fence boards were entirely blown off on all sides.

This disaster, and the fact that none of the giant powder contained in one of the demolished buildings was exploded, not only repeat the warning with regard to the manufacture and care of nitro-glycerine, but also shows most strikingly how very safe is giant powder when finally manufactured. The cause of the explosion is not positively known, as certified in the statement of the trustees, on page 364, who give further information of the accident.

INADVERTANTLY OMITTED.—The following, which has been handed to us, explains itself:

"EDS. M. AND S. PRESS:—Please insert the following award, which was inadvertantly omitted in the revised list furnished you: Mrs. H. G. Suplee, easy threading needle, silver medal. Respt'y,

A. S. HALLIDIE, Pres't.
GEORGE PARDY, Sec'y.

Rebellious Ores and New Processes.

[Written for the Mining and Scientific Press.]

Editors Press:—We are continually hearing, through your columns and from other sources, of "rebellious ores" which cannot be worked, and of wonderful "new processes" which will extract all the precious metal, if not more, from any ore whatsoever. Electricity appears, just now, to be the favorite catch-word among "process men," who, like quack doctors, know well how to atuue their lay to the popular ear.

The cry of rebellious ores is, to miners, the consolator of despair; to a certain class metallurgists, the cloak of ignorance; among speculators in stocks, it is the excuse for worthless mines and barren ores; to buyers of ores in San Francisco, it is a source of great profit and of equal amusement; to the sensible and intelligent metallurgist it is, in most cases, simply *bosh*.

I firmly believe that there is not an ore of gold or silver in this country that caunot be worked to a reasonahle percentage—say 80 to 90 per cent. of common fire assay (which is way below the truth)—by some one of the known processes. The Sheba mine alone, of all that I have yet seen, furnishes au ore which is comparable, in point of refractory combinations, with those of Lower California, successfully worked hy the Triunfo and other companies.

Operations of Practical Men.

The usual course when au ore is to be worked is to send a rich sample to San Francisco, where it is treated by some metallurgical wiseacre of that city, usnally in an iron pan rich with the residues of former operations. I have known several hundred dollars per tou iu gold to be returned by oue of these concerus from a test (God save the mark!) of ore which contained uo gold worth speaking of.

Then an amalgamator, or smelter, is sent to the mine. If he he of the class of self-styled "practical" men—that is, ignorant of nearly all that he ought to kuow—he commonly adopts the pan process, in some of its many empirical forms. He puts in a little sulphuric acid, perhaps, and follows it immediately with a little carbonate of lime, or caustic potash, soda, etc., and points triumphantly to the ensuing effervescence as proof that "it is working," iu blissful ignorance of the resultiug compound. If one were to advise the use of sulphate of lime, or potash, or of glauber salt, the "practical man" would be very much amused.

One of this class ouce asked me why it was that he failed to he able to cupel a piece of *black lead*. Another objected to melting his gold in a black lead pot, because it gave him *lead in his gold!* They make nice distinction between sulphate of iron and sulphate of copper when used in an iron pan, and eschew muriatic acid while freely making use of sulphuric acid and salt. Well, if the ore is pretty facile, the "practical man" gets out about fifty or sixty per cent. of the silver, and considers himself successful. If uot, he fails.

The "Doctors."

Should he, however, be of the more pretentious class, especially if he be a *doctor*, he goes to work with a grand flourish of trumpets and a great outlay of (other peoples') money on some "new process," of course of his own devising, and equally, of course, utterly absurd and impracticable, even if theoretically correct. *His* failure is a foregoue conclusion, without ifs or buts; and one fine day he goes to San Francisco "on business," and fails to come back. His "works" are sold at a loss; the smokeless chimney becomes a landmark for travelers and a warning beacon to capitalists. He pockets his salary and goes to work on another new process. His employer's pocket their loss, and pronounce the mines a failure. The disappointed but not daunted miner shoulders his pick and goes prospecting for "gold rock" or for silver ores which can be worked; the storekeeper foots up his bad bills, and all shake their heads and say the mines are rich, but the ores are "very rebellious." The village, or "city," once so lively, becomes more desolate than the desert from which it sprung. If, hy chance, a metallurgist who does know his business is employed, the chances are that he is so cramped by the meanness or stupidity of the Grand and Sublime Muddlehead G. & S. M. Co. he works for, that he can do nothing, and either retires in disgnst or is kicked out with a damaged reputation. This is a true picture of what has happened in dozens of instauces.

Examples.

In Cerro Gordo, the ores were "very rebellious," and the smelting furnaces would not "stand" until one with capital and commou sense went there and proved the contrary. Hot Springs has been blasted, and San Francisco ore-hnyers enriched, by tue cry of "rebellious ores." But that day has passed here, I think. At Grass Valley, the sulphurets of the Eureka mine became all at once so "rebellious" that the local "sulphuret men" could do nothing with them until Deetken—whose attention was drawu to the snbject by a letter of the present writer's in the M. & S. Press—went there, aud solved the problem. Meadow Lake and Arizona are still under the han of "rebellious ores" and the cursc of "new processes."

A "New Era."

But now, for the hundredth time, a new era has dawued. The metallurgy of gold and silver is to be "revolutionized;" and Dr. Rae, Snperintendent of the Desulphurizing Electro-Mining Co., of Syracuse, N. Y., and Empire City, Colorado, is the long-looked-for metallurgical Messiah. He has already worked seven hundred pounds of horribly rebellious ores.

Down on your knees, ye stiff-necked, unbelieviug miners, and clasp your grateful hauds, ye despairing capitalists, for the day of deliverance is at hand! Hide your diminished heads, practical men and professors, and let the Hagau furuace pale its ineffectual fire, for behold, a greater than you cometh;—one who is prepared to extract "all the gold or silver from the most refractory ores" by "a very simple and economical process," which "covers the application of electricity, or magnetism, in any mode in which it has hitherto been or *may hereafter* be applied." That is to say, our sapient Patent Office has granted a patent to Dr. Rae for the application of electricity in modes in which it was applied before Dr. Rae ever thought about it, aud has also granted patents to other parties for modes which were already covered by Dr. Rae's pateut! The fact is, the Patent Office aud the public are being most egregiously humbugged in the matter of new processes.

Chemistry of Amalgamation.

I call upon the examiners to note this: The Mexican patio process depends for its efficacy ou the preseuce of "magistral" (which is simply impure sulphate of copper) and salt. These make chloride of copper; and this, with quicksilver, copper or silver, makes subchloride or dichloride of copper, or cuprous chloride; it is all the same. It is this dichloride of copper which acts on the silver ore. The Mexican "fonda" process consists in boiling the ore pulp in a copper pau, with "magistral" and salt, quicksilver and mechanical agitation. Here again we have the same effect. The sulphate of copper and salt, as well as chloride of silver, whether previonsly existiug or formed in the process, make, with the copper of the pan, this same subchloride, or dichloride of copper, or cuprous chloride, or cupric dichloride, or by whatever other name our chemists, in the present transition state of chemical nomenclature, may choose to call the substance Cu^2 Cl.

Again, when bluestone and salt are used in iron pans, the contact of iron, of reduced copper, as well as of quicksilver, produces this same substance, which acts on the ore till it is itself destroyed hy the iron pan. Any patent, therefore, on the "use of dichloride of copper in amalgamation" is just so much waste paper.

Merits of Electrical Processes.

Aud these "electrical processes," in nine cases out of ten, are nothing more than the Mexican fonda process, inveuted two hundred years ago. Do they uot all use metallic copper and salt; and do they not all produce, in some way or other, tho substance Cn^2 Cl or dichloride of copper? Verily the pateutee of the "use" of that substance will have a goodly fortune if he can collect royalty of all who "produce" it in their operations on silver ores!

I am not an old fogy, and I believe that electricity may yet play a very important part in our metallurgy; but I also believe that the time is not yet come, and that the use, or hypothesis, of any other electricity than that necessarily involved in any chemical reaction, is, in any of the processcs now hefore us, all stuff and nonsense; either purely suppositious or quite superfluous. But I am open to conviction.

Method Pursued at Hot Spring.

I am now working the "rebellious" ores of the Blind Spring district, or Hot Spring, in Mono Couuty, to 80 to 95 per cent. of common fire assay, and my bullion is .940 @.970 fiue. I use the old Mexican fonda process, with such improvements, looking to economy, as are suggested to me by a slight knowledge of metallic chemistry.

Nothing Refractory and Nothing New.

I will close hy reiterating my conviction that there is no ore of gold and silver, on this coast or elsewhere, that will not yield to the intelligent application of some one of the known processes; and further, that no important discovery or invention in metallurgy, at least other than purely mechanical, has been yet made, or may be looked for, for some time in this country. If there is au exception, it is probahly Kustel's combinatiou of Plattner's gold process with Patera's silver process.

Chas. H. Aaron.

Moutgomery, Nev., Nov. 14, 1869.

"Common Sense."

[Written for the Mining and Scientific Press.]

C. T. Hopkins, Esq., President *pro tem.* of the "Immigrant Uniou," has written a pamphlet of sixty-four pages, to which he has affixed the title of "Common Sense Applied to the Immigrant Question." The Union over which he presides, have "ordered 10,000 copies of this Common Sense to he printed aud distributed throughout the States."

The avowed object of the Uuion is to attract the attention of the people of the Atlantic States and of Europe to the immense resources of California, and the inducements they present to those who desire to migrate in search of a new home, with the view to improve their conditiou.

The object of Mr. Hopkius is two-fold,—first, to secure material aid from the public and from the Legislatnre, in the shape of subscriptions and appropriations; secondly,—to make known abroad our resources, etc., with tho view to secure the desired population. Had his object been the reverse of all this, we think he could not have secured it more effectually thau he will by a dissemination of his "Common Sense."

We believe Mr. Hopkins to be siucere in his convictions, that mining for the precious metals, as a branch of industry, is no longer profitable; and that it should be shunned as a demoralizing curse to the community. At the same time, we believe Mr. Hopkins to be so thoroughly imhued with prejudice against mining, as to disqualify him from drawing a faithful picture of our resources—the chief of which is, and will long continue to be, mining! As au evidenco of that prejudice, we refer to the speech made by him at the hanquet given hy the Chamber of Commerce two years ago, —which was published in the *Alta*, and uoticed in the Scientific Press.

It was the mineral resources of this country which brought most of us to these shores, and it will he the mineral resources which will cause most of those who, for generations to come, will follow us.

The prosperity of the farmer and of the manufacturer are due to the mines; the mines built San Francisco, and have created our fleets of inland and ocean steamers, and have caused the construction of every mile of railroad throughout the State.

To the mines do the rich men of Califoruia directly or indirectly owe their wealth. To the mines do the mechanic and laborer owe the high rate of wages they have so loug enjoyed, and from which they have accumulated millions of savings to disburse again in the shape of assessments upon "feet," or in monthly instalments to pay for homestead lots, for which they have no use—disbursements made more frequently to enrich others than themselves.

To the mines are our land lords indehted for the high rents they have so long enjoyed,—whether those reuts were derived from city property or farm lands. We ask Mr. Hopkins to point out where one hundred thousand dollars—the result of profit from farming—have been invested in San Francisco; and we will show him a million against it from the mines.

Mr. Hopkins shows the product of bullion from the "Comstock" for four years, or rather 3¾ years, to have been $31,038,190, and the dividends over assessments to have heen $3,616,250; and then, after a grand flourish, says: "The owners of the mines would have made $3,616,250, clear profit, if they had not in the meantime lost $9,601,800 hy depreciatiou of the stocks!"

If Mr. Hopkius knows anything about the Comstock mines, to which he refers, he ought to kuow that notwithstanding all the waste and extravagance attending their management, they have returned thousands of dollars for hnndreds expended to develop and work them. This he can ascertain by referring to the reports of Messrs. Ross Browne, Raymond and others. Then let him add to the profits of the mines, the profits of the Union Mill Company, composed of some half dozen men, mostly in San Francisco, who own or control upwards of twenty mills, which are kept constantly employed upon the reduction of ore from the Comstock mines, for which they obtain $13 a ton; while other mills, owued outside of the combination, would be glad to do the same work for $10 a ton. These profits would make a material difference to both assessments and dividends. While Mr. Hopkins was engaged in the collectiou of statistics in regard to mines, why did he not refer to the reports of Messrs. Ross Browne and Raymond for statistics in relation to some of the incorporated companies of California, such as the Amador, the Eureka, the Idaho, and others, which are held for investment and managed in the interest of the owners, with the view to profit aud not for speculation. We ask Mr. Hopkins to go hack eleven years, to the condition of San Francisco when the Frazer river excitement broke out, which gave a shock more severe than that of the severest earthquake—followed hy the discovery of silver, which was the turning point in the career and prosperity of the city of San Francisco.

Mr. Hopkins estimates the population of California at 500,000, and the annual consumption of farm produce, for each individual, at $100, makiug au aggregate of $50,000,000. He does not say whether this estimate is hased upon the value of the produce upon the ground, or whether it includes the cost to remove, with commission and profits of jobber and retailer. In one case it would lessen the value of farm produce; in the other, increase the expenditure of the consumer upwards of 50 per cent.

He then adds the amount of *exports* of farm produce, estimated at $16,000,000, which, with the $50,000,000 before mentioued, make $66,000,000. Then compare it with the production of mines—$23,809,057.

He appears to lameut that the farmer must feed our whole population, and a portion of our dependencies, before a single shipload can be spared for export. He tells us how many acres are under fence, and the value of their produce, and then estimates the value of the produce of 40,000,000 of acres; but has failed to furnish the particular information wbich would be of most interest and value to those who would he likely to come here to engage in farming, viz: The price of land in the various couuties, accessible to market; the cost to plow, seed and reap per acre; the yield of the various cereals; the cost to thrash, and hag, with the freight and commission to the nearest shipping point, with all charges.

Such dates would enable others to judge whether wheat, etc., can be raised to profit, at present prices, not likely to be increased hy au increased production. Then if Mr. Hopkins would collect statistics as to the manufactures to show the percentage consumed in the mines compared with that of the agricultural counties, he would give some insight into the merits of that branch of industry. In conclusion, we believe the resources of the State to be beyond the estimate of Mr. Hopkins; at the same time we believe that he must be content, for very many years to come, to see the mining interest of our State at the "head," instead of the "foot," of our industrial resources. C. M.

Mechanical Progress.

The Westernhaus Brake.

This operates by compressed air, and upon the whole length of the train at once. As described in the *U. S. Railroad Register:*—"A vertical steam cylinder (10-inch diameter, 10-inch stroke) fastened to the side of the locomotive, drives an air-pump of the same size, and fills a strong reservoir of boiler plate, beneath the platform, with air condensed to a pressure of 100 lbs. to the inch. The reserve of condensed air is always at the engineer's command. A second gauge, placed above his steam-gauge, indicates to him what the pressure of the air in his reservoir is at any moment. The steam cylinder, communicating directly with the boiler, will pump away until the pressure in the air reservoir rises nearly to the pressure of the steam which drives it, and then stops. When the engineer uses a portion of the air to break the train, the pump goes to work again of its own accord; and if there be a leak anywhere, the steam cylinder will feel it and keep at work, just enough to keep the pressure up to par.

Every car has beneath it a gas-pipe one inch in diameter, running from one end to the other. At each end of this pipe a short piece of india-rubber hose terminates in a brass tube, with a valve in it, to prevent the *exit* of air. Coupling any two cars, you couple also two of these tubes, by sliding one inside the other. Under the middle of each car is a ten-inch cylinder with piston-head, and piston-rod, and a branch to the long gas-pipe. Its piston-rod is directly connected with the wheel-brakes, and presses them against the wheels with the force of the compressed air in the reservoir, which can be let on slowly or instantaneously or continuously, as the engine driver sees proper to do it."

Pressure of Steam not the Cause of Boiler Explosion.

A. T. Hay has written to the Chicago *Railway Review* upon this subject, since the explosion at the Indianapolis Fair-grounds. He says the generally held notion is erroneous; and that chemical action of some kind, produced by the impurities contained in the water used, is undoubtedly the cause of most boiler explosions. We quote portions of his communication:

"Hundreds of old boilers are run with their maximum of steam until their outer shells are so corroded and worn away by *oxidation* that you can drive a punch or even stick a jack-knife through the iron. A passenger engine on the Baltimore and Ohio Railroad, at Columbus, came out of the round house in a leaky condition. The jacket was removed, and the bottom of the boiler was found to be in such a condition that with one blow a hammer could drive a punch through it; and yet that engine had been making her regular trip, carrying 120 pounds pressure. And hundreds of boilers are condemned every year under similar circumstances; that is, they simply let the steam and water out at the weakest place, no particular damage being done, nobody hurt, and no explosion reported. These facts rather shake the bad iron theory.

Many even of the best, heavy, new 5-16 iron boilers explode with terrific force, tearing through solid iron, leaving the seams or joints unbroken, with a full gauge of water and at a low or medium gauge of steam. At the Pennsylvania Iron works, Danville, Pa., in 1867, a new cylinder boiler connected with 30 other boilers by large steam pipes, exploded with a full gauge of water 20 minutes after the fire under it had been extinguished, and while the fireman was putting in a new grate bar,—killing seven men, and tearing the iron like pasteboard.

In 1860 the propeller Globe exploded her boiler in the port of Chicago, seven hours after her arrival, when her fires had cooled down, and the steam gauge only showed 10 pounds pressure,—utterly destroying the boat and cargo.

In Cincinnati, Nov. 3, 1868, a saponifying tank used for the separation of the glycerine from the fatty acids contained in tallow and other fats, by means of steam taken from a boiler carrying from 85 to 90 pounds pressure, exploded, throwing the wreck two squares.

Water used for steam purposes usually contains more or less mineral matter in solution and organic matter in suspension, and a rise of temperature up to boiling point is favorable to chemical action.

Now take water for steam containing mineral bases combined with their acids, animal fat and other organic substances. The fats or oils will act chemically on the steam, forming fatty acids and glycerine, while the organic matters liberate nitrogen. That glycerine is a base, and combines chemically with nitric and sulphuric acids is well known. The glycerine will combine with its due proportions of acids, and having a greater specific gravity than water will gravitate to the bottom of the boiler, where it will remain harmless, so long as the temperature of the iron is below 360° Fahrenheit. This degree can only be reached under ordinary circumstances, by the sudden lowering of the temperature of the steam or water; which will give sudden rise to the temperature of the iron, and the thicker the iron the hotter it will get, and the more liable we are to have terrible explosions.

Why all writers ignore chemical action within a steam boiler, with all the evidence of corroded iron, and the deposit upon the inside of the boiler of incrustations is more than I can account for. I have examined hundreds of boilers, and made up my mind years ago, that engineers, as a general thing, are no more responsible for those terrible disasters than we are for the effects of a tornado at sea. And, in conclusion, let me say, I have seen, *in two instances, a substance resembling coal-tar and earthy matter came out of boilers, that was about as explosive in the open air as gunpowder.*"

HÆMATOXYLIN IN PHOTOGRAPHY.—Logwood contains a crystalline matter, termed hæmatoxylin, which is prepared from the powdered extract by digesting with ether. The liquid is distilled and mixed with water; and in a few days hæmatoxylin is deposited in crystals. The extract of logwood treated in this way yields from ¼ to 1.10 of its weight of this substance. The fact that hæmatoxylin reduces salts of silver and turns red in the sunlight suggested its application in photography, and the experiment has recently been tried in St. Petersburg by Dr. Tabensky. Two plates were sensitized and exposed in the usual way, The one was developed with pyrogallic acid, the other with a solution of hæmatoxylin. The result was equally good in both cases. Dr. Tabensky found the following mixture to work well: 0.5 parts hæmatoxylin, 80 parts distilled water, 22 parts acetic acid of 33°. A little glycerine improved the developer.—*Journal of Applied Chemistry.*

WELDABLE IRON.—Mr. E. Williams read a paper before the Iron and Steel Institute at Middleborough upon the manufacture of rails, in the course of which he said that the severe tests of rails, by heavy falling weights, necessitates the use of iron that welds with difficulty, and therefore does not make the best rail for wear. He adds: "On this subject I have thought and experimented much, and I am satisfied that a fibrous nature and weldability do not go together, and that only well puddled, crystalline iron welds easily, and, therefore, with moderate certainty. Given any kind of wrought iron, it welds more easily in its first stage, that of puddled bar, than at any future one; and the effect of roughing it down, that is, of extra piling and rolling, is always to diminish the weldability of the resulting rail piles. Those who make cable bolts, best boiler plates, and other similar iron, know how certainly they are spoiled if they are worked hot—in other words, if they are welding hot."

CHUCKS.—The "scroll" or "universal chuck" should have only three jaws. "Articles to be chucked are seldom near enough of a size in two directions to engage four jaws equally. If the article is not a true circle, three jaws will always hold with an equal bearing. For circular central work, such as blank gears, wheels, small pulleys, and all circular pieces which need a true central hole, the scroll chuck for accuracy and expedition has no rival, but it should have only three jaws. The chuck best entitled to be designated 'universal' is the independent jaw chuck, the jaws of which are operated by a steel screw. These chucks have four jaws, which operate independently of each other. Articles of great variety of shape may be held in this chuck as well as circular, eccentric and one-sided pieces, and they hold the article much firmer than the scroll chuck, and hence they are much better adapted to solid work."—*Cor. of Amer. Railway Times,*

Scientific Progress.

Zoic Theory of Chemical Geogony.

Prof. Henry Wertz read a paper before the American Association at Salem in which he enunciated an original theory, viz.: that life is, and has always been, the governing influence in all chemical changes that ever occurred or will occur; and that the prozoic atmosphere contained very little or no free oxygen, but consisted essentially of carbonic acid, nitrogen and aqueous vapor, while at the same time the constituents of the ocean were at their maximum of oxidation. We quote a few paragraphs, more or less condensed:

"What is our only source of oxygen at present? Evidently the decomposition of carbonic acid by solar force, through the influence of plant vitality—a never ceasing agency which has continued to increase the proportion of oxygen and diminish that of carbonic acid in the air since plants began to grow upon the earth. * * * To the objection that in the earliest sediments we find little organic, or even carbonaceous matter, I reply that (apart from the graphites and sulphides, both believed organic in origin,) it is easily understood that while life might withstand the ferric compounds, dead organic matter would quickly be burned up thereby, the sulphides having indeed resulted from this very burning process; the original oceanic metallic sulphates, which are now extant as sulphides, having given up their oxygen to the atmosphere by this indirect process of reduction by dead organic matter. I may add, that there has been still another source of oxygen, freed through vital influences: that oxygen which represents the proportion deficient in bituminous coals to form water with the hydrogen. This represents of course oxygen which has at first been merely transferred from hydrogen to carbon; but as the carbonic acid, once formed, is again decomposed and its oxygen set free, it amounts to the same thing. * * The notion that ferric solutions are inimical to life, is not supported by evidence, although *ferrous* solutions are so, without doubt. * * It has been claimed that subærial action of carbonic acid, on alkaline and earthly silicates, would introduce into the ocean enough of bicarbonates to render it neutral, or even alkaline, and to precipitate all ferric oxides and hydrates. No doubt this took place *locally*, and the iron ore beds of these rocks are thus (and I believe thus only) to be accounted for. We have thus actually a prop to my theory. Still, to bring the whole of the ocean to a neutral or alkaline condition must have required time enough for the deposition of the whole mass of the Eozoic schists, if not of a portion of the Palæozoic. The formation of gold veins has occurred throughout all time, and is even now going on, by virtue of the same agencies that I was the first to discover in 1858; the alternate formation, by oxidation, from auriferous pyrites, of ferric solutions of gold, and their reduction to ferrous conditions again, by further reactions with unaltered pyrites or with organic matter. * * From the above it will be seen that my reasonings have led me to believe that, in Prozoic times, all the oxygen of the earth which now enters into the processes and changes going on upon its surface, all the *potential* oxygen of the earth (so to speak) was locked up in combined forms and divided between the earth's hydrosphere and its aërosphere; combined chiefly with iron in the former and with carbon in the latter."

WHY STRETCHED RUBBER CONTRACTS WHEN HEATED.—This occurs within a certain range of temperature, owing to the presence in it of vesicles containing aeriform matter. When the rubber is stretched, these vesicles are elongated; and when heated, their tendency to resume the spherical form tends to the lateral expansion, and consequently to the longitudinal shortening, of the stretched material.

CITRIC ACID IN TOMATOES.—Prof. Silvestri of the University of Catana has found an abundant source of citric acid in the plant *Tomato de la Paz.* This belongs to the family of the *Solanaceæ*, is about twelve feet high, and contains one and a half per cent. of citric acid. He has also found it in the common tomato, and it probably exists in all the plants of the family.

Manufacture of Chlorine.

Mr. Walter Weldon read a paper at a late meeting of the British Association, upon the manufacture of chlorine by the means of perpetually regenerated manganite of calcium. He claims not only to have produced a new compound, but to have reduced, by fully eighty per cent., the cost of the principal item in the manufacture of chlorine, and also to have made such manufacture possible without the production of any offensive residue. He thus describes his process: "The liquor which remains after a charge of manganite has re-acted upon hydrochloric acid in any suitable still is run into a receptacle, in which it is treated with carbonate of lime, to neutralize any free acid, and to decompose any sesquichloride of iron or of aluminium which may be contained in it. It is then pumped up into an elevated cistern, in which it is left at rest for a few hours in order that it may deposit solid matters in suspension. The most abundant of these is usually sulphate of calcium; but there are also small quantities of sesquioxide of iron, and larger or smaller quantities of alumina and silica. These impurities having deposited, the supernatant liquor, which is a mixed solution of chloride of manganese and chloride of calcium, and is now quite clear and of a beautiful rose color, is run off into another vessel, where there is added to it the quantity of lime necessary to decompose the chloride of manganese in it, and nearly an equivalent more. A blast of air is then injected; and what was at first a perfectly white mud, all the manganese in which was in the state of MnO, soon becomes a very black mud, nearly all the manganese in which is in the state of MnO_2. This is then allowed to settle for twelve hours, at the end of which time it has separated into a denser black mud and a supernatant clear solution of chloride of calcium. This having been drawn off, what remains is ready for use in the still. It is used as mud, without drying, being conveyed to the still by pipes and entering by a hydraulic lute. In the still it meets with hydrochloric acid, from which it liberates chlorine, at the same time reproducing exactly such a residual solution as was commenced with. With this solution the round of operations is recommenced; and so on, over and over again, continually."

WERE THE TWO OCEANS ONCE CONNECTED AT DARIEN?—Some geologists have attempted to account for certain climatic phenomena in Europe, by supposing a former depression at the Isthmus, sufficient to allow the Gulf Stream to have flowed into the Pacific. A comparison of the Coral Faunæ of the two coasts at that point results in the discovery of the fact,—says Professor Verrill,—that no species are found to be identical, while even the genera and families show remarkable contrasts. * * * "We may legitimately conclude that no very extensive or deep connection, sufficient to alter the course of oceanic currents, can have existed since the coasts have been inhabited by the existing species, otherwise a greater admixture must have taken place. A narrow or shallow channel of communication would probably account for all identical species yet observed; but at what period it may have existed is still another question."

THE COLORS DIFFERENTLY DISTINGUISHABLE.—Bright yellow is the color most easily distinguished, and violet and red the least. Blue comes next to yellow. In singular conformity to this is the fact, that if a spectrum be projected through a slit in paper surrounding a basin of water containing water fleas, the greater number of the insects collect in that part of the water illuminated by the orange yellow rays, and the fewest in the line of the violet, which would seem to indicate that they too most readily perceive yellow light.

OCCLUSION OF HYDROGEN BY NICKEL.—M. Raoult finds the small cubes of nickel, such as we find in commerce, to be in an eminent degree porous, and to have, like palladium, the power of absorbing hydrogen. One cube of metal will occlude 165 times its volume of gas. It appears that once hammered, the metal loses its porosity and powers of absorption.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Sorghum Culture.

A greatly increased interest appears to be manifested of late at the East, in the culture of sorghum, or the Chinese sugar cane, and its value as a farm crop is now quite generally admitted. This advance is due in part, to the introduction of improved facilities for the manufacture of the syrup, hy which the enterprise devoted to the crop is more fully rewarded, and largely to the high prices caused by the political disturbances iu Cuha aud the failing of our crop iu Louisiana; but the great underlyiug cause of high prices may be referred to the natural increase in consumption of sugar, and the growing disproportion hetween the supply and the demand. This alone is sufficieut to prevent sugar from declining to the old prices, until some new and more productive source of the article shall he developed. Sweets of all kinds must rule high iu price for some years to come, at least.

A number of enterprising farmers located in the San Felipe Valley, Monterey oonnty, have recently undertaken the experiment of raising "sorgo." Some 45 acres have heen harvested with most satisfactory results. The cane has been produced at the instigation of Mr. J. H. Purdy, who, being provided with all the necessary machinery, has been experimenting in the production of sorgo syrup for the last two years. His experiments, last year, were a failure through the incompetency or neglect of the party to whose care they were committed. This year he has met with good success.

As far as the manufacture has progressed, the production has been 400 gallons to the acre. It is thought that it will average 350, or about double what the sorgo grown in the Eastern States—in Ohio, for instance—produces. It is believed the cultivation of this plant will yet prove very remunerative in situations where the heat and length of season are sufficient for its growth up to a full maturity.

We have seeu samples of this syrup, which is of a light amber color, and compares favorably with the syrups manufactured at the refiueries in this city. It was manufactured by Mr. George X. Collins, hy the new Weller & Hatcher process. It ought to retail readily, in this city, at 75 cents per gallon, or ahout $120 per acre for the farmer's share, in addition to about 40 hushels of seed to the acre, worth at this time about six cents per pound for seed. This is more profitable than raising wheat at $1 per cental, or barley at 75 ceuts, which are ahout the current rates for these grains paid to the farmer.

How to Utilize Smutted Wheat.—The Willamette *Farmer* says that smutted wheat can be made iuto good and wholesome flour by adding one quart of finely-pulverized air-slacked lime to each eight bushel of grain, and thoroughly mixing it hefore it is passed through the cleaning apparatus of the grist mill previous to grinding. The lime seems to cut the smut which adheres to the fuzzy end of the wheat, and is blown out with other dust and dirt. If this is a fact, it is new to us, and is well worth the attention of the farming community everywhere.

Oats in Oregon.—A telegram to the *Bulletin* of this city, a few days since, says the merchants of Walla Walla complain that they cauot get hold of enough oats to supply the local demand. Two and a half cents per pound is offered. The late warm rains in that vicinity have started grass, which is growing finely. The hills and valleys are remarkably green for this season of the year.

Advantages of Good Cultivation.

Liebig states that the farming lands of Hesse iucreased 300 per cent. in value in fifteen years, simply on account of improved culture, introduced through scientific investigation and experimeut.

It is well known that the yield of sugar in the Island of Mauritius gradually fell off, from its large original yield, to 2,000 pounds per acre. Laudowners were not slow to perceive that their estates were fast being ruined by improvident culture without rotation of crops. An improved system of cultivation was introduced a few years ago, including a free use of guano, and the result has been that the yield of sugar has been increased to 6,000 pounds per acre. The soil of the island is very rough, and obstinate, so much so that it is worked almost exclusively with the hoe, and other hand implements. Bad culture has so impoverished the sugar lands of Lousiana that they have fallen off to 1,000 pounds per acre, according to reports two years ago; although the reports of the Agricultural Bureau at Washingtou for the present year set down the yield at 1,500 pounds.

It is claimed that the saving of grain iu the United States by the introduction of the recently improved thrashing machines (which are computed to be about 230,000 in number) is fully $10,000,000 over what could be realized were our present crop to be thrashed by the old-fashioned flail.

Farmers sometimes poh-poh at "scientific farming," and the introduction of "new-fangled machinery." Will such people tell us what we should do without the farming machinery introduced by the present generation? What would be the conditiou of our lands without the use of mineral manures—the direct results of "scientific farming?" They would be as desolate as the plains of Babylon or the hills of Judea, once the garden spots of earth; but now, through lack of scientific farming, abaudoned to wild beasts.

The wheat lands of the Middle States have fallen off in the yield of wheat from an average of forty to fifty bushels per acre, to one of ten or twelve, through lack of proper culture. The older lauds of California will not produce to-day more than half as much as they did fifteen years ago; while the plains of Egypt are as fertile now as they were in the days of the Pharaohs, for the only reason that the waste of crops is supplied hy an annual source of fertilizing material from the overflowiug waters of the Nile.

Soap Suds.

The value of this article as a stimulant of vegetable life cannot be too highly appreciated. It contains the aliments of plants in a state of ready solution, and when applied acts not only with immediate and obvious effect, but with a sustained euergy which pertains to but few even of the most concentrated manures. The proper way to utilize this material is to cause its absorption in a compost heap. Muck, loam or stable compost should he deposited where the drainage from the sink and laundry, may find its way to them and he absorbed for the benefit of the crops. In this way several loads of most excellent manure, suitable for the support and sustenance of any crop, might be made at comparatively small expeuse. The highly putrescent character of this fermentable liquid qualifies it admirahly for the irrigation of compost heaps of whatever material composed. Being a potent fertilizer, it must, of necessity, impart additional richness to almost auy material to which it may he added. Try it, and mark the result.

Importing Weeds.—The Willamette *Farmer* complains that several new varieties of weeds have heen introduced into Oregon iu packages of seeds sent from the Department of Agriculture.

The Beet Sugar Movement.

The *Bee* says that the Sacramento Beet Sugar Association have on hand about 200 tons of sugar beets, raised upon their own farm, for the purpose of experimenting in that hranch of industry. Their machinery for sugar manufacture was to have been set in motion the past week. If it proves profitable, the Association will enter largely into the business the coming seasou, and other refineries will he erected in many places; hut if the experiment fails, then it is not likely to be tried again for years to come.

No opinion as to the probable result can he given. The test must he awaited. We only know that the beets can be raised here cheaper than in Europe; but the question to he solved is, how much eugar will they produce per acre or per ton? When we know that, we know all, and until we know it we can know nothing valuable concerning this interest. The result is awaited with auxiety, but with confidence.

It may surprise many to learn, what is nevertheless a fact, that fully one-third of the whole amount of sugar consumed in the world is mauufactured from beets. While the soil needed for the sugar beet is quite different from that best suited to the grape, the climate required for the two is identical—warm and dry. Much money has been lost in attempting to cultivate the sugar beet in the moist climate of Englaud. Efforts in this direction have now been abandoned; yet immense quantities of the raw beet sugar of Germany and France are imported into the British Islands from their refineries, competiug very successfully with the cane sugar from their own colonies. The successful iutroduction of the business into this State would establish a large and important branch of agricultural industry. Hence the anxiety with which the results of the experiment at Sacramento are awaited. It is known that the beet in California secretes about two per cent. more of saccharine matter than it does in the best localities in Continental Europe, and every condition here seems favorable.

Improved Cotton Culture.

The system of field labor which has heretofore obtained at the South, has not heen at all favorable to experimeutal culture; hut with the renewal of industry there, under more favorable auspices, more attention is very geuerally being paid to improved cultivation. More care is heing taken to keep the lands in good condition, hy the use of manures and rotation in crops; and more attention is being devoted to diversified agriculture. One of the most interesting experimeuts in the way of improved culture, which we have noticed, is that of Col. G. B. Lockett, of Georgia, who has beeu making an experiment this year of "high" culture in cottou, which will he worth much as an example to the planters of the South. He put in six acres of cottou, with the desigu of making their product equal to that of seventy-two acres cultivated in the usual careless, superficial manner.

The average yield of cotton on Georgia lands is about a quarter of a bale of lint to the acre—or, a bale to every four acres. Col. Lockett aimed to gather three bales from each of his six acres, and the Albany (Ga.) *News* says that he will come pretty near doiug it. His land was richly manured, carefnlly, deeply and minutely cultivated and kept in the best order; and the result is that notwithstanding the severe drouth in Georgia, which interfered materially with the experiment, he has a splendid crop. It is estimated that he will gather seveuteen bales, of 500 pouuds each, from the six acres. This will be worth, if only of ordiuary quality, $2,125; but as the manure and careful cultivation will have made the staple of unusual length, and fineness, it is estimated that it will sell for thirty-five cents per pound, or $2,975 for the whole—making the richest yield of six acres ever witnessed in cotton culture in the South.

A Horticultural Experiment.

The Bucyrus (Ohio) *Journal* invites attention to a very singular and interesting experiment recently performed in that place. A lady was told that if, on the 1st of August, she should pick from a young lilac its entire foliage, the tree would forthwith not only put forth new foliage, but hlossoms also. The experiment was tried, and the results were as predicted.

Such phenomena are not uncommon; and are explained on the well known principle that a tree when so wouuded as to threaten its existence, immediately directs all its energies to develop flower or seed buds, as if in that way to secure the perpetuation of its kind. This is often done when a tree is so wouuded that its next winter or period of rest proves its last. This peculiarity was strongly exemplified in the actiou of the fruit orchard mentioned in these columns three weeks ago, the trees of which, after being maliciously girdled, seemed to put forth renewed energy, and produced a most extraordinary crop of fruit (seeds). This effort appears to be accomplished at the expense of a severe drain upon the roots, which, if the wound has been very serious, is apt to eventuate in the death of the tree the next summer.

If pear and apple trees, after having made their spring growth, aud perfected their fruit buds for the ensuiug season, are subjected to a long period of severe drouth, followed by a period of moisture and warmth, they will often again break into fresh leaf and hloom. And in California especially, such fruit is generally perfected; but it is usually of small size. In the Northeastern States, the shortness of the season generally prevents the perfection of the second crop. The same effect is produced hy pulling the leaves off when the huds for the ensuing year are fully ripened.

A Boston Notion—Horticultural School.

It is reported that as soon as the uecessary funds are obtained, an institution is to he opened near Boston in the novel form of a *horticultural school for women*. We find the plan described as follows: It comprises a farm, containing ahout twenty acres, five acres to be used for the cultivation of small fruits, flowers, and salads, and such vegetables as are euitable for culture by female labor, the rest to be devoted to mowing and pasturage; a good plain dwelling house capable of accommodatiug about thirty inmates; a harn large enough for the farm stock, and an experimental plant house for growing flowers aud early vegetables, and the forwarding of plants for field crops, The control of the institution is to he vested in a president, secretary, treasurer, and twenty-four managers—one-half of whom will he ladies—who will be aided hy a competent instructor, an experienced farmer, and the necessary assistants. The pupils will be instructed in plain sewing, the use of the sewing machine, and in all kinds of housework, as well as in horticulture, and lecturers and teachers in kindred branches of labor and service will be employed from time to time.

It is intended to receive pupils to the number of twenty-five, who are from the age of sixteen upwards, of good character, fair education, and able to work as may he required. The course of instruction will extend through two years. The estimated cost of procuring the farm and outbuildings and maintaining the school for three years, is $30,000.

A Wonderful Plant.—A specimen of a remarkable plant—"The Flower of the Holy Ghost,"—has been successfully raised in Norwich, Conn. The flower is a creamy white cup, nearly as large as half an egg, and extremely beautiful, and its wonder as a natural floral growth is the fact that in this flower is a little pure white dove, with pink bill and eyes, and its head turned as if looking over its back. Its wings, feet, bill, etc., are as absolutely perfect as those of the living dove, whose counterpart this wonderful mimic bird is.

No Room for Flowers.

We pity the householder who says that he or she has no room for flowers. It is to be feared there is a desert in the heart of such a person. Not to love flowers is to be indifferent to one of the most beautifnl gifts of God to man. What, got a few square feet in a front or back yard, or even an empty window sill, and still "no room for flowers?" The writer has sometimes dwelt in straightensd quarters, with twelvo hours a day devoted to lahor; hut he never yet was in a place where he had no room for flowers, or saw the day when he had no time for their culture. It is true, a small city yard is but a poor place for a floral display; but *something* can always be grown and pleasure derivcd therefrom, wherever the sun shines, be it upon the open soil, a covered pavement or an elevated window sill. By the exercise of a little judgment and care, a very fair display of the treasures of the floral kingdom may be made in a front yard of only a few fcet depth.

The *Hearth and Home* speaks of a retired horticulturist, who had left his heautiful garden in the country and settled down upon the pavements in the city of New York. In the back yard of his residence, however, were to he seen the evidences of his old love for the beautiful, in hundreds of rare and handsome plants growing luxnriantly on a little patch, which comprised an extent of ground only equal to a bed five feet wide by thirty in length, and yet, says our coutemporary, "We will venture to say there was a greater variety of choice plants growing within this space than can he found in the gardens of nine-teuths of our wealthiest farmers, or in the suhurhan homes of our merchant princes. In a shady nook, ferns of a dozen or more species were unrolling their fronds, the hasement windows were screcned with morningglories, while roses and verhenas hloomed in the eunniest border, and low-growing lobelias and myrtles peeped out from underneath the taller-growing plants. A rustic vase held the following plants: *Coleus Verschaffeltii, Lysimachia nummularia, Maurandia Barclayana, Hedera helix, Cuphea platycentra, Convolvulus stellatus, Verbenas*, three varieties, and two sorts of creeping myrtle."

Does not this prove that "where there is a will there is a way" of accomplishing our object in floriculture? Blessed is he that has but little, but more hlessed is he that makss the most of what he has!

GETTING DRY.—The ground in many places is getting too dry and hard to plow. The grain upon the fallow and most of the other ground which has been sown is up and looking finely; but the farmers need more rain before they can proceed much further with their plowing and seeding. In some localities tho dry north winds are telling unfavorahly upon the young grass and grain. Many of the trees, especially in the foot hills, which were persuaded into premature hudding and blooming by the few days of warm southern winds, have gone back again, and will bide their time.

RANCH DESTROYED.—The Turner ranch of 700 acres, in Linda township, near Marysville, once considered one of the finest ranches for agricultural purposes in the Yuba bottom, has recently been sold for $500. It was covered with sand by the flood of 1862, since which timo it has become overgrown by willows and cottonwood, the growth of which for fuel is the only use to which the property can now be put.

FEED YOUR TREES.—Some of our fruitgrowers are complaining of a deterioration in fruit. This thing grows out of our California way of farming, without attending to the kecping up of the land. Trees require plaut food as well as corn, or potatoes, or wheat, and they will suffer without it, giving evidence of the lack in hoth the quantity and quality of the fruit.

Twenty Farms on Fire!

The rule in this State seems still to be to run our farms into harrenness. But few farmers look much beyond the present. They want all they cau get now; and they generally take it iu what they conceive to he the easicst way—leaving the future to take care of itself. There are notable exceptions, it is true; hut they are rare. The Oakland *Transcript*, under the above head, touches up some of our improvident farmers as follows:

At any time within 300 years, the Tycoon would have disemboweled any one, or more of his suhjects, who were guilty of euch agricultural incendiarism as the grain growers of California are in the hahit of committing every year. The intolligence and conscientiousuess of Japanese agriculturists, surpass that of Californians, immeasurably. A Japanese would as soon roh his wife's mother as roh his Mother Earth. There prevails in Japan a morality in agriculture which prohibits anyhody from impoverishing the soil. Ground which has yielded a crop, must he replenished with fertilizing agents hefore being taxed for another yield. In California, our grain growers *burn the straw*, return nothing to the soil, yet take a crop from it every year. One night last fall, we counted from the deck of ths ferryboat, twonty fires hurniug in Alameda eounty. Twonty piles of straw, representing an important product of farms. *Twenty farms on fire!* Wo call that agricultural incendiarism, and the result of such incendiarism, practiced for euccessive years, is well known in many parts of the Stato. Land that once produced sixty hushels of grain per aere, will not yield thirty now.

Hybridism in Fruits.

It has heen stated that there is some evidence to show that the character of one variety of the strawberry was effected hy growing iu the vicinity of other sorts. Hiram Walker, of Washington county, N. Y., who has practiced grafting since 1818, writes, that according to his experience, the same thing takes place with apples and other fruits, and he thinks the fact that some winter apples does not keep, is not due to their heing grafted on stocks of early varieties. He says he never knew any difficulty in keeping fruits where the orchard was all of one kind but that when early and late sorts were altogether, late fruit was rendered early, and early fruit made late, from cross impregnation. He mentioned a tree in Saratoga county which was in part grafted with a sweet variety, but the grafts bore sour apples for several years; the grafts of the eweet apples had been put into the lower limbs of a sour apple tree, and so long as the upper limbs of the original tree remained, the sweet grafts bore sour fruit, from blossoms being impregnated by those on the limbs above them; when the natural limhs were removed then sweet apples were produced. Mr. W. mentions other instances of a similar charactor which have fallen under his observation. The euhject is one not only of ecientific interest, but of actual importance to all fruit growers. It is within the observation of every one that a variety of fruit is not the same, eveu in widely separate localities. The differenco is by eome attrihuted to soil and exposure, by others to the character of the stock upon which the fruit is grafted, and now we have the influence of the pollen of our neighboring sorts charged with being the disturhing cause. Other observations on these pointe are needed.—*Utica Herald.*

MIGNONETTE TREES.—A correspondent of the London *Journal of Horticulture* gives a plan of growing miguonette as a little tree for the conservatory. He says: "Sow a pinch of seed in the center of as many three-inch pots as there are plants required. When the plants are strong euough, thin them by degrees to one plant in a pot, and that must bo the strongest. Train that up to a stake to the height required, pinch out all side-shoots and the heads of hloom, but do not divest the stem of its leaves until the plant has attained its full hcight. To form a head, about three are left at the top."

WHEAT IN COLORADO AND MONTANA.—The farmers of hoth Colorada aud Montana are highly gratified at the results of the wheat crops in their respectivo Territories. Forty bushels to the acre in the former, and fifty in the latter, of choice, plump grain, are not uncommon.

DAY AND NIGHT WITH PLANTS.—Plants cannot he kept at the same temperature day aud night, and remain in health. In houses where plants are merely kept out of the frost, the night temperature may go down to within a few degrees of freezing. Heat in houses where plants are in hloom, should he at from 60° to 65° during the day.

MUSTARD SEED.—The Chinese are said to he making mouey in Monterey county by gathering and shipping to this city wild mustard seed. Last year one Chinamen employed ten of his countrymen in the business and pocketed a profit of $15,000.

TAXING LARGE RANCHES.—The experiment of taxing large ranches at their full valuo has been found to work well the past year in Los Angeles. The result has heen that thousands of acres have passed from the hands of speculators into the possession of producers, who hring active capital and permanent prosperty into the county.

THE English potato crop has turned out better than was expected. Experience is proving that it is mainly the late varieties which fail there; such being injured by the heavy autumnal rains, which come before they cau be taken from the ground. Farmere are urged to plant early varieties.

THE first cargoes of this year's California wheat are heginning to arrive at Liverpool. With the present market thore, the shippers must he largely losers. This is very unfortunate, and tho fact has a depressing influence on the market here.

TAR ON PEACH TREES.—A fruit- grower in Bartlett, Teun., followed the advice given in "Ten Acres Euough," and covered his peach trees for a few inches ahovo the ground with tar to keep off borers, etc. Result—an equal number of dead trees.

GRAIN IN SAN DIEGO.—The grain crop in San Diego couuty, the past season, has turned out very finely, iu spite of tho warnings of the old Californiane that the country was too dry for grain.

SWEET POTATOES IN OREGON.—The Willamette *Farmer* says that as fine and equally as large sweet potatoes have beeu raised in Oregon, the past season, as have heen received from California.

CRAB APPLES are assuming much more importance among northwestern orchardists than heretofore.

THEY are planting black locust trees in Los Angeles for future use.

The "Driver" Ants.

Dr. G. A. Perkins contrihutes to the *American Naturalist* a description of these ants, the pest of tropical Africa. We quote and condense:

"The night is chosen for their foraging expeditions. In the midst of social enjoyment the announcement is made, 'Here are the drivers!' and, instantly, all are on the alert to escape. Lanterns and hamhoo torches aro lighted, and a search made about the house to learn the direction taken by the assailants; and if in their usual numbers, the house is often left to them entirely for hours.

An invading army could not exhibit a higher state of discipline than is seen in the movements of these insects. They enter a house usually at one point, whero a stroug guard is stationed to defend the pass; they then branch off right and left, and again divide, and subdivide, till the whole ground is completely covered; not an inch is left unexplored, and every crack and cranny is entered, giving hut little hope of escape to any creature that may he found secreted there. Attacking their prey, they plunge their forceps into it, regardless of the size or strength of their antagonist. Nothing will cause them to relax their hold. The animal or insect writhes or twists under the pain; hut his case is rendered more hopeless every moment hy additions to the numher of his assailants; at length, when completely exhausted hy struggling, he yields to his fate, and is dispatched. They have been known to attack a human heing, when rendered helpless hy disease, and cause his death in a few hours.

If a live coal is dropped in their way they immediately attack it, though hundreds may perish in doing so. It is interesting to see a hand of these midnight marauders returning home from the scene of plunder on the approach of day. Issuing from the same place they entered, they are each seen hearing away some trophy with them; a joint of a cockroach's leg, the hody of a spider, or the larvæ of some insects, etc., are the various spoils. As the lahorers pass on with their loade they are guarded by a largo body of soldiers, which are stationed along the sides of their path; or, if they aro to pass through a place of uncommou exposure, these soldiers form a covered passage, hy standing upon each other's backs and hooking their forceps together. Through this arch thue formed the laborers pass in safety."

THE USE OF BOTH HANDS.—A writer suggests that it would be a good thing for men and women were they taught, in childhood, to use their left hands equally with their right. The use of the right hand only for certain actions—such as writing and working with mechanical tools—is entirely couventional, and there does not appear to be any reason why people should not be ambidexter in every kind of manual work. Persons who have lost their right hand by accident frequently acquire great facility with the left after eome practice, but grown up persons have not always the patience to hetake themselves to the necessary practice. By children the thing would be acquired ineensihly, if means were taken to lead them to the practice of it. Children living in houses where two languages are spoken acquire both with great facility, and what is true of tongues would he equally so of hands.

A STEAM OMNIBUS.—An omnibus, drawn by a road steamer, has heen huilt in Edinburgh for an enterprising omnibus proprietor in one of the largost English towns. At the first trial the eugine, with the omnihus attached to it, was run up and down the incline to exhibit its speed and the ease with which it could he controlled. It went up the hill at the rate of seven miles an hour and came dowu at the rate of nine. It turned iu the road with far greater ease than if drawu by horses, was pulled up instautaneously at the word of command, and even backed up hill. It then ran at hest omnibus speed up Leith street, in spite of its steepness. Tho dexterity with which it picked its way hetween strings of cart-horses, omnihusses and cabs, and the docility with which it stopped or turned wheuever it was required, were spokeu of as marvellous.

ANOTHER BATTERY.—M. Böttger is reported in Paris journals as recommending for force and durability the following for galvanic batteries: A cylinder of amalgamated zinc is placed in a concentrated solution of equal parts of common salt and sulphate of magnesia; the antimony is placed in a porous cell filled with dilute sulphuric acid.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

TARSHISH.—*Chronicle*, Nov. 20th: Considerable first-class ore has been taken from the upper tunnel. Good headway is being made in the lower.

PENNSYLVANIA.—This company is at work in the south drift, and rich rock has been taken out.

THE MOUNTAIN.—The furnace house has been rebuilt with regard to safety from fire, and work in the tunnel is progressing. Water is coming in, the rock is seamy, and several spurs of quartz have been cut.

LEVIATHAN.—*Miner*, 20th: The first pit of charcoal for this mine is nearly ready, and it is thought that the soil near Soda Springs will serve as a flux.

IMPERIAL.—The tunnel is now in 1,280 feet, and has been run with less cost and in less time than any other work of the kind in Alpine.

ORE SHIPMENT.—The teams which took the machinery to the Leviathan mine last week returned loaded with ore, which they will deliver at Reno, to be shipped thence to England.

AMADOR COUNTY.

CASCO.—*Ledger*, 27th: We learn that this mine is steadily improving. During the past week, excellent rock has been struck in the north level.

CALAVERAS COUNTY.

RAILROAD FLAT.—*Chronicle*, 27th: The Petticoat mine is to he supplied with new machinery for both milling and hoisting. The machinery has been purchased, and is already on its way. It is the intention of the proprietor to have it in operation before the rain sets in.

NEW DIGGINGS.—The Mokelumne Hill Canal Co. have just laid 3,500 feet of 11-inch pipe, under 20 feet pressure, to conduct water on to Poverty Bar Ridge, near Camanche. The ditches connecting with the pipe are completed, and the water is now on the ridge. A dozen miners' cabins have been erected in that vicinity within the past week or two, and their occupants are already washing. Teams are hauling lumber, and everything is hustle.

MARIPOSA COUNTY.

QUARTZ MILL BURNED.—*Gazette*, 26th: On Wednesday last the hoisting machinery and buildings of the Marble Springs mine, near Coulterville, were destroyed by fire. The mine had not been worked for a year and a half. It is supposed to have been set on fire.

NEVADA COUNTY.

MINING ON THE RIDGE.—Grass Valley *Union*, 23d: At Birchville not much is doing. Chinamen are working the opened claims, and are not making more than wages. There are many valuable unopened mining claims at and near Birchville. These will he worked to advantage when the tunnel now being run is completed. This is now in 3,000 feet, the end being 400 feet from the surface. A shaft is to be raised from the end of the tunnel. At Buckeye Hill, the Evans & Stidger claims yield from $16,000 to $18,000 for every 30 days' washing. At French Corral there are three cement mills (one a new one) of ten stamps each, running constantly, with profitable results. The cement claims at Empire Flat, one quarter of a mile from the Corral, are doing well. At Sebastopol, the American Co. is doing well, working with the hydraulic process. On San Juan Hill, two new companies have started up. The Eureka Lake Co. is, especially, taking out good pay. At Badger Hill, two companies are waiting for a tunnel to be completed. The English Co. is doing well. The McDonald Co. at Grizzly Hill has struck good gravel. The Chinamen bring in to Block & Furth, Bankers at San Juan, from $2,000 to $5,000 worth of gold dust per week.

RATTLESNAKE.—Same of 26th: There have been some discoveries of good quartz ledges at Rattlesnake, five miles south of Grass Valley. Numerous locations of claims have been made.

MINING SITUATION.—Same of 28th: Mining in Grass Valley was never more brisk or more profitable than it is to-day. We hear the best of news from the upper part of the county. Near Nevada City the Pittsburg is yielding splendid rock. At a point 30 feet south of the old works the rock taken out yieled $98 per ton in free gold, and the sulphurets at Maltman's works yielded $150 per ton. The yield of rocks and sulphurets together gives as the proceeds per ton about $135. Yesterday, Delano sent below a bar of gold worth $6,000, the product of Perrin's mine, Wolf creek, in two week's run. The shaft is being re-timbered, and the workmen are not taking out ore. This mine employs 22 men, and its yield, since opened, has amounted from $11,000 to $12,000 per month. Hoisting, pumping and crushing are done by water-power. The Wisconsin mine and mill has started up, the old employés leasing the works. The John Bright will have a whim in operation in a few days. Good rock is coming out. At Rattlesnake, Eudy & Co. are about putting up a mill. The O'Connor mine is taking out splendid rock. The Allison Ranch Co. has struck it rich. At the depth of 486 feet, on the incline, the main ledge is three feet thick, and is covered with free gold, besides being rich in sulphurets. In the lowest north drift the ledge shows well. The Carihoo ledge, supposed to he a feeder to the main ledge, is turning out the richest rock ever taken out in this district. The Carihoo is ten inches in thickness, and shows great flakes of gold. The office of the company, at the Ranch, is crowded with rich specimens of quartz from the Carihoo. The Harterey is paying for sinking, and a small dividend beside. The prospects are good. The Eureka and Idaho keep up their same old steady lick, giving no astounding items, but turn out big dividends.

LARGE LUMP.—*Transcript*, 23d: On Saturday in the Kennehec claims, near Birchville, a lump worth $200 was found in a crevice upon the bed-rock.

TO START AGAIN.—The Pennsylvania Co., which has not been worked for two years, is about to he started up again. When this lead was struck, for a long while it paid handsomely. It is the general belief that the Nebraska lead runs through these claims.

MEADOW LAKE.—Virginia City *Enterprise:* A gentleman just in from this place says rents are remarkably cheap in that town. About half a dozen families have their choice of two or three hundred houses. Mining and milling are at a standstill. The ores are very intractable, and even the most stout-hearted and enthusiastic are becoming discouraged.

FALL CREEK.—*Gazette*, 23d: A gentleman just down informs us that the Dillon and Industrial companies—consolidated for prospecting—have their tunnel in 1,000 feet. The tunnel is supposed to he within 50 feet of the gravel lead, the perpendicular depth being 200 feet. The Maguire, adjoining, have run a tunnel from the face of their hydraulic claims into the Doolittle Hill, and found pay gravel from the start. Their last clean-up yielded $3,000, after 45 days' run. Henry & Co., below, have suspended work for the winter, and propose putting up hoisting works next spring. Five companies below are doing work enough to hold their claims. About 25 miners will remain in the camp during the winter.

PLACER COUNTY.

IOWA HILL.—Cor. of Auburn *Herald*, 27th: Morning Star Co. started up their new 10-stamp mill six weeks ago. They have just cleaned up 600 ounces, the result of three weeks' run, working daytimes only. The new 20-stamp mill at Monona Flat will he ready to run the first of January. The Lebanon mill, near Wisconsin Hill, is ready to run as soon as they can get water. The ditches are not of sufficient capacity to afford water for any great length of time. There is some talk of bringing in a branch of the South Yuba ditch. If that is done, Iowa Hill will become a flourishing mining camp.

PLUMAS COUNTY.

PROSPECTS WELL.—Quincy *National*, 20th: O'Neill & Co., prospecting on the head of Newtown Flat, near the old Pioneer claims, struck pay dirt a few days ago. They have sunk three shafts, each 40 feet deep, and at the bottom of the last one struck gravel which "pans" at the rate of $3 per sack full. The character of the gold shows that they are on the old Elizabethtown lead.

SHASTA COUNTY.

SALE OF DITCHES.—*Courier*, 27th: E. R. Jones, of Eagle creek, has sold the two Cottonwood ditches to Mr. Pottor of San Francisco. The price paid is reported to he $2,000. We understand that it is the intention to enlarge these ditches next summer.

DITCH LEASED.—A. R. Andrews has leased his mining ditch at Roaring River to Wm. Logau. The ditch is in good running order.

SISKIYOU COUNTY.

QUARTZ.—Yreka *Union*, 20th: At Wheeler & Baker's may be seen specimens of quartz from the Eliza ledge at Humbug, owned by Lash & Co., plentifully sprinkled with free gold, and filled with the heaviest sulphurets of iron. The quartz resembles that found in the Eureka and North Star ledges, at Grass Valley. The ledge is over six feet wide in the new tunnel.

MCADAMS CREEK.—Lieut. H. Mathewson has struck a quartz ledge in the old Hardscrabble claim. It is three feet in thickness and rich in gold. He is taking out quartz, which he intends to get crushed as a test.... Chinamen are employed as drifters in nearly all the claims on McAdams creek. They give general satisfaction, and work for just half the wages demanded by white men.

TRINITY COUNTY.

PROSPECTING FOR QUARTZ.—*Journal*, 27th: Mr. Phelps has found rock in West Weaver Mountain, which, by imperfect working test, yielded at the rate of $50 per ton in silver. The formation of a company is seriously talked of, and an organization will be effected soon. There can he no doubt that there is a rich mineral belt ranging through the county. The character of our placer mines establishes this fact.

BROWN'S CREEK DITCH.—The new flumes are put in all the way to Mahie's Flat, and the ditch cleaned out. The rest of the ditch on the other side of the creek will he repaired immediately.

TRINITY CENTER.—Boynton & Whitmore finished cleaning up last week, taking out about $4,000....Thomas Cayle is putting down a large flume in his claim....George Williams and Lewis Hall have purchased the Sikes ditch and claim; have thoroughly repaired the ditch and flumes, and are ready for operations.

TUOLUMNE COUNTY.

PLACER MINING EXCITEMENT.—Sonora *Democrat*, 27th: The miners at Chinese Camp and vicinity have been for a week staking off ground. Two colored miners, on Tuesday, found rich pay one-half mile northeast of Chinese. Some Chinamen who had been working in a small gulch which runs into Wood's creek, quit work some time since. The darkies prospected on the banks where the Chinamen had not worked, and struck diggings that pay from one to two ounces a day to the hand. Some of those who have taken up claims have found good prospects, and commenced washing.

BUCHANAN.—Mr. Breuer brought to town Monday last over eight pounds of gold, the result of the last run on rock from the "Old Buchanan mine."

Arizona.

BIG BUG.—Prescott *Miner*, Nov. 13th: Theo. Boggs, on Thursday, informed us that the mill was running on Eugenie rock, which, from indications, was paying well. Lively times in Big Bug now.

THE PROSPECTORS.—Jackson's party returned Sunday from their prospecting trip, after an absence of nearly three months. They were unsuccessful in finding placer diggings, but found lodes of gold and silver quartz that assay handsomely. Many of the party talk of going back again.

Colorado.

WARD DISTRICT.—Boulder *News*, 16th: We are informed that the Ni-Wot Co. have struck a body of ore in their east drift that turns out over $300 per cord. They are running 20 stamps. There are 50 men employed in the district. One other mill is kept at work most of the time. Some of the miners are piling up their best iron for some better method of working. At Gold Hill, Wm. Brierly has suspended operations for the winter, for want of milling facilities, there being but one ten-stamp mill in the district. Christopher Houlk has completed his hoisting works on the Horsfall, and will work during the winter. He is down 100 feet, and has a crevice of one foot of $400 iron, per cord, of ten tons. Parties working the claims adjoining Houlk on the west, are taking out ore that will run $500, and over, to the cord.

MINING ITEMS.—Central City *Register*, 18th: Dr. Rae's machinery for the Knickerhocker mill, at Empire, passed through town to-day....Two Cornishmen rented the Dead Broke lode, a branch of the Gregory, a short time since, and their ore, crushed at Walker's mill, yielded ten ounces per cord....The Consolidated Gregory Co. shut down their mill on Monday, but will start up again next week....Plumb Bros. have the plates of their new mill in excellent order, and are running it on ore from the Leavenworth lode, Russell district, for Chas. Harker....Judge Dickerson is still putting an engine and boiler into his mill below Black Hawk....Ed. Moores is fitting up the old Wilson mill, in the 3d Ward. He is cutting a bed-rock ditch for water, and thinks he will have no trouble in running all winter.

Georgetown *Miner*, 18th: Work on all the tunnels is progressing favorably, with indications of rich "strikes" in two or three of them....Stewart will start up his works as soon after his return as he can obtain a supply of ore....The Baltimore Tunnel has been widened its entire length, and the drills are now working in the heading. Sinking on the Boaz has been resumed....L. Huepeden & Co. are running on a lot of Magnet ore. There is something over two tons being treated. Samples of the pulp assay over 200 ounces in silver....L. Huepeden & Co's new crushing machinery is doing better work than with the stamps. The running of the new cylinder is perfection. One-third less power is required to run it than the old one, and the charges are several hundred pounds larger. ....Dr. R. J. Collins will soon resume work on the Tropic lode, Sherman Mountain....The ore vein in the east stope of the Terrible has widened to 12 inches. The production of ore is greater than ever.... The Marquette is the west extension of the Correct lode. The crevice has been developed by three shafts, from 6 to 13 feet deep, 300 feet apart. A vein of mineral is making its appearance on the hanging wall.

CAPITAL MOUNTAIN.—Discovery shaft on Stephen Girard lode is 12 feet deep; pay-vein ten inches. On the Capital lode the pay-vein is four feet wide at 50 feet depth in discovery shaft. An average assay gave $198 per ton. Selected ore gave $13,000 per ton. Other assays by other persons gave about $1,200. On hand, four tons first-class ore, and a large quantity of second-class. Active work will soon be commenced.

OHIO MOUNTAIN.—Rip-Tearer lode has a 15-foot shaft. Fear-Not has a wide crevice. Commonwealth has a very large outcrop. Discovery shaft 60 feet. Crevice at bottom full seven feet wide. Two tons of first-class ore on hand, and a large amount of second-class. Ohio lode shaft is 70 feet deep and has a 7-foot crevice.

MOUNT OLIVE.—Mayflower shaft 10 feet down. Emmet is well opened in several places. The ore is worth $100 per ton. A tunnel site has been selected and work commenced.

HIGHLAND MOUNTAIN.—Discovery shaft of Highland lode 40 feet deep. Crevice four feet—pay-vein 10 inches. Native silver is found. Select ore assayed $1,300 per ton. Fourteen and a half tons have been treated, and profitably. Vigorous work will he continued all winter.

Montana.

BUTTE CITY.—"Clover Leaves" in *New Northwest*, 19th: Comparatively little of the mining ground in the vicinity has yet been worked, lying above all the ditches yet in. The yield, where water is obtained, is large. In the gulches covered by the two or three ditches, only a few claims could be worked in 1869. Forty-five claims (names given) paid, in 1869, $161,000. There are hundreds of claims above the level of the present ditches. These will quadruple the yield on the completion of the Humphrey ditch, now being built by the Humphrey brothers. This is one of the gigantic works of the day. Butte, on the Pacific Slope, needs water; Boulder basin, on the Atlantic Slope, has it. To carry it from the one to the other, a ditch 30 miles long, with a tunnel 24,000 feet long, through out the main divide of the rocky mountains, is necessary, is undertaken, and is almost completed. It will carry 2,000 inches of water high on the Silver Bow region, and give employment to 5,000 men.

LAST CHANCE.—Helena *Gazette*, 18th: On Taylor, Thompson & Co's claim below town, a deposit has lately been discovered, which will take a long time to mine out. This runs twenty feet deeper than has ever been heretofore penetrated on this claim, with equally good pay.

SHIPMENT OF QUARTZ.—C. W. Sears has just returned from shipping 90 tons of rock eastward, to be tried. This is from the rich lodes at the head of Ten Mile. From Corinne, the ore will be shipped by railroad.

GOLD CREEK.—The camp has suspended operations for the winter, with the exception of two claims on Pilgrim Bar.

PHILIPSBURG.—*Capital Times*, 17th: Benj. Levy gives us these items: The Eastern Camanche is 1,000 feet open, and from 30 to 78 feet deep, by inclines and shafts. It is owned by the Brown Bros., and Cogswell & Waterbury. They have 600 tons of ore out, some of which is so rich that native silver may be seen. The Mountain Queen is another rich lode. The ore is free from base metals, and Mr. L. thinks it will yield $100 to the ton. It is owned by John Ullery, Ben. Franklin, and Dr. J. M. Merrill. The Speckled Trout lode, owned by Cole Saunders, is now being developed. Eight hundred tons of ore have

been taken ont within 30 days. This is to be run threngh a concentrator, and afterwards shipped East in gunny sacks. The Acliff is the name of another lode, owned by Mr. Arthnr Horton. Mr. H. bas 40 tons of ore, part of which was crushed, showing an average of $85 to the ton. There is a shaft on this lode 50 feet in depth.

Nevada.

COPE DISTRICT.

MOUNTAIN CITY.—Elko *Independent*, Nov. 27th: The Atchison and Drew mill will start up to-day. Milliug facilities are greatly needed. New discoveries are daily made in the mountains for a circuit of 60 miles.

COPE ORE.—About three tons of rich ore from Cope were received en Thursday by Reinhart & Co. It was forwarded to San Francisco to be worked. The last shipment of ore from the Mountain City mine worked $342.17 per ton. This was taken from tbo surface, with n view of giving a fair sample. Some ef the ore was covered with moss. Ten tons of choice ore will be shipped, five tons to the English mill at Reno, nnd five to San Francisco.

HUMBOLDT.

ROCHESTER.—*Register*, 27th: Mr. Onderdonke, the Supt., hns returned from the East, prepnred to rcsume work in the shaft immediately. A pump to drain the sbaft will be put in as soon as soon as it can be procured frem San Francisco. An engine for hoisting and pumping purpeses is already on tbe ground, and werk will be carried on steadily during the winter.

TAILINGS.—Mr. Pease, Supt. of the Union Series mine, has purchased a large pile of tailings, the nccumulation of a year's custom work at the Holt mill ere it was removed to Golconda, nmeunting to several hundred tons, and will ship them to the Reno mill for amalgamation.

UNIONVILLE.—Correspondence of same: The old war betweon the Silver Mining Co. and John C. Fall nnd others, has broken out anew. The Co. hnve commenced an action aginst Full & Co., charging tbem with trespassing, nnd have asked for nn injunction.

ARIZONA MINE.—The *Enterprise* has seen some very rich specimens of ore from this mine, and from tbnt of the Silver Mining Co's claim. This company ship some 15 tons per day to Swansea, which works $550 per ton, nnd have reduced at home some 30 tons that pays $100 per ton.

BATTLE MOUNTAIN.—*Register:* The extensive mineral deposit recently discovered in the vicinity of Galena, ten miles from Battle Mountain, are erenting an excitement. Miners and business-men are rushing thither.

THE UNION SERIES.—Work progresses steadily on the Union Series in Winnemucca mountain, and recent developments are encouraging. Superintendent Pease shipped last week to the English Co's mill at Reno, 15 tons of ore for reduction.

REESE RIVER.

MINERAL HILL.—*Reveille*, Nov. 22d: The agent of a company at Virginia City nrrived bere on Saturday, for the purpose of examining quartz mills, and to select one and have it removed to Mineral Hill.... The *Independent* says: McWilliams, Mills nnd Frazier have made arrangements with Ward & Co., who own pretty much all of Mineral Hill, to erect n ten-stamp mill. These gentlemen have gone to San Francisco to purchnse the machinery, and intend to have it on the ground within two weeks.

MANHATTAN.—*Reveille:* Tbe mincs of this Co., on Lander Hill, never looked as well as at present. In the different works, the drifts and breasts expose extensive bodies of hnndsome ore, which seems to assure tbe supply of the works for a long period. Yesterday six bars of bullion were shipped overland per W. F. & Co.

SPRING VALLEY.—We have before us specimens from the Reeves and Berry, and two unknown claims, which are masses of stetefeldtite. Chloride ore is found in some of the claims, samples of wbich appear to abouud in horn silver. One specimen which has been shown us assayed $1,483 per ton in silver.

EUREKA DISTRICT.—The amount of smelting ore is abundant. Tbere will probably be a dozen furnaces in the district before the middle of next summer. Twenty tons of lead bullion have been produced by tbe smelting works during the last 30 days. A letter says: The Eureka furnace, under Col. Buel's mnuagement, will start in two or three days. Col. Robbins' and one or two more furnaces are nbout to he commenced. Col. Robbins has a mill on the road,. which will he here in 14 days. Some large sales of mines are reported. The Champion and the Buckeye were bought by Messrs. Buel and Bateman. On the whole, things look promising.

OPHIR CANON.—Major Clendon, the Supt., is pushing work in the Murphy mine of the Cambridge (late Twin River) Co. The water has been entirely pumped out, and men are at work drifting and sinking.

SANTE FE DISTRICT.—Several lots of ore hnve already heen hauled to the mill in this city, the net yield of which was considerably more than the expense of mining nnd milling.

SILVER PARK.—Cer. of *Inland Empire*, 26th: "There are about 100 claims located on these hills, all of which show fine chloride ore of a greenish blue color. The ore assays from $100 to $800 per ton. Immense quntitics of float, or boulders ef ore, are found on the flanks or sides of the hills, nnd several parties have collected from 10 to 30 tons.

WASHOE.

SIERRA NEVADA.—Gold Hill *News*, 27th: The raise from the car-track level has connected with the southwest surface deposit, and the north drift from the same level to connect with the north surface body has struck petty good quartz. The mill is shut down for two or three weeks to put in new machinery.... YELLOW JACKET.—The only developmcnt made lntely, is the assessment of $5 per share. The present yield is 200 tons ef ore per day, including large amounts of low grade ore taken from the 700-foot level of the old mine, nnd shipped by rnilroad to the company's mill on Carson River.... OCCIDENTAL.—Face of lower tunnel in quartz shewing metal, and constantly improving. The body of ore recently developed at the north end of the old mine is improving in heth quality nnd quantity.... SAVAGE.—Sinking in the main shaft progressiog. The late ore develop ments senth of the shaft are looking well, yet are not quite as extensive as at first anticipated.....HALE & NERCROSS.—Tbc body of ore developed at the 1,100-foet level is known to he 300 feet in length, with an average width of 30 feet. It extends to the level ahove, and the sinking of the main shaft 100 feet deeper will he sbortly commenced. A telegram of the 23d says: The northern cross-cut has reached the west wall. Tbe ore at this point is 49 feet wide; the western is ten feet, and contains the richest ore ever found in the mine.... OPHIR.—Still waterlogged, the water in the new shaft being nemly 400 feet deep. The pump is working finely, discharging at the rnte of 16,000 gallons per hour.... CALEDONIA.—Indications at the 100-foot level are promising.... BULLION.—Prospecting as usual, principally at the 1,400-foot level.... SEGREGATED BELCHER.—The small body of rich ore is as yet not fully developed. The mine generally is looking well.... CROWN POINT.—The cross-cuts east and west from the south drift at the 1,000-foot level show no metal.... KENTUCK.—The principal ore supply is from above the 800-foot level, and the usual daily yield is kept up. Considerahle ore is produced from the upper levels.... CHOLLAR-POTOSI.—The present yield is 125 tons per day, assaying $40 per ton.... GOULD & CURRY.—Present yield a little ovcr 50 tons per day from the old workings, cnr samples nssaying $39 per ton.... VIRGINIA CONSOLIDATED.—New shaft 440 feet deep. The rock heing favorahle, with little water to interfere, good progress is made.... OVERMAN.—Yielding 130 tons of ore per day, which assays $49 per ton.

WHITE PINE.

The usnal mining review for the week has failed to reach us, either through the *Empire* or the *News*.

DOWN THE CANON.—*Empire*, Nov. 23d: As Gold Cañon is to the Comstock as a milling center, so is the cañon stretching away to the eastward of this city to White Pine. Snbstantial improvements are to be seen all along the route, and general thrift seems to pervade all branches of industry. At the Cbicago mill several largo teams are discharging machinery, and a large force of mechanics putting it in place. The Swansea mill, with a fair supply of ore on the dump, is kept in constant operation, works to perfection, and is yielding splendid rcsults. A little further along, Colonel Townsend has men widening his grade. Nevada mill has been out of service the past week, pending the change from dry to wet crusbing. The machincry will be set in motion again to-day for the winter's run. There are 12,000 tons of ore from the Aurora Consolidated mine on the dump. The Little Treasure and Henderson's mill are botb in litigation, and in consequence are idle. The machinery for a foundry is to he seen a short distance above the Swansea mill.

HIDDEN TREASURE BULLION.—There were shipped from Lerhenan & Co's nssay office, Shermantown, yesterday, three hars ef bullion, 984 fine, aggregating $4,011.52, which is the first shipment of bullien from ore ef the Original Hidden Treasure mine worked at the Metropolitan mill.

HAPPY JACK WINS.—The suit between the Happy Jack and John Dare Companies was yesterday determined in favor of the fermer. One of the peints at issue was the number of days work necessary to hold a location for one year. Judge Beatty adhered to his former construction of the miuing laws, te wit: that two days laher for each claim of 200 feet is requisite.

AN ITEM.—A few mouths since, a man with ne capital save a peny, some hlnnkets and a little foed, left Hamilteu on n prespecting trip. Seuth ef here some 100 miles he found some ledges. By dint of hard work he dng two tens ef ore. He took it en pack nules a long distauce to a quartz mill in Hiko nnd had it worked. After paying nll expenses, the bullien from the two tens nctted him nearly $600 per ten, with which he beught him some mining teels, seme flour, hacon nnd whiskey, and going back, fixed him a cabin, and has now set down to his winter's task of developing bis miue.

OFF FOR KERN.—Same of 27th: Yesterday morniug, Taylor, Southwick and Barnaby left this city with a wagon loaded with provisions and chemicals for Kern District. They inteud to spend the winter in developing some of the mines in which they are interested. They will make experiments in the reductieu of ore by an arastra. Several parties are talking of taking mills inte Kern this winter.

BASE METAL RANGE.—A Shermantewn letter te the Elko *Independent* says: The Base Metal Range is now attracting more attention than auy other locality. The mountain is almost one selid mass ef mineral, of high aud low grade. Smelting furnaces are to be secu in full blast at every turn of the roads nnd bend in the cañons, while the late increase in the shipments of rich lead bullion attest the fact that the ore can be successfully reduced by smelting.

New Mexico.

UTE CREEK.—Elizabcthtown *Telegraph*, Nov. 20th: Over the range, a large amount of money is heing expended in perfecting tbe arrangements for mining. The two quartz mills are as complete ns possible. On this sido of "Baldy," the prospects are brightening. Graham & Co's quartz mill will soon he iu, nnd will be put up speedily nfter its nrrival.

PLACERS NEAR SANTA FE.—"Mr. Brown has sold his mill to the Candebrian Q. M. Co., and we are ruuuing on quartz from the Co's mine with good results. There is a three-foot crevice of quartz, with a shaft 60 feet deep, with levels running 20 feet each way on the lode. Brown is opening a promising lode. The shaft is 60 feet deep, with a 2½ foot veiu. We ran eight tons of quartz, which yielded well. He is putting up another stamp-mill. At the Old Placer, the Co's mill is running on quartz from various lodes. I understaud the rcsults are not flattering."

PLEASANT HILL.—"The only company now working is Collins & Co., of Orleans Flat. They rock out about $10 per day to the man. Last Chance has shut up shop, so has Shouneasy. The boys on Willow Creek look smiling."

Oregon.

RAIN.—Jacksonville *Sentinel*, Nov. 20: For several days past the much-hoped-for rain has been coming down. We hear the Chinamen are buzzing around lively in their mining operations, and white miners in a few days more will bnve plenty of water.

PLACER GOLD.—Dalles *Mountaineer*, 16th: We were shown to-day a very good prospect of placer gold taken from Mt. Creek, about ten miles from the Dalles.

AMALGAM FOR ELECTRICAL MACHINES.—Dr. Böttger recommends the following preparation: Two parts hy weight of pure zinc are brought to fusion in an iron spoon, and one part of mercury carefully stirred in. Tbe product is an exceedingly brittle, easily pulverized, silver white amalgam, which in compact condition can be presented any time in closed bottles. It is best to rub up a small piece in a mortar, when wanted, and mix with a little tallow.

PHOTOGRAPHING COLORS.—An announcement has been made to the French Academy of Sciences by M. Cross that he has succeeded in photographing colors. Specimens were shown at the same time. If the report is reliable, the fact is an important one.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Dec. 3, 1869.

W. T. Atwood states the following as approximate price at which copper ores can now he sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores nssaying ahove 30 per cent., $2.50 per unit. Bars at the rnte of 13c. per lb. for pure copper.

EASTERN LAND OPERATIONS.—Several prominent gentlemen have recently purcbased 75,000 acres of school swamp lands in Wisconsin at a very low price. They are also purchasing large quantities of other unoccupied lands. All of this land will he sold to emigrants, who will settle upon and improve it, *at cost*—the purchasers considering themselves amply repaid for their trouhle in the general prosperity which will tbereby accrue to the State. Will our Californin laud monopolists make a note of the above?

THE LAST FROM DR. LIVINGSTONE.—Dr. Livingstone was at Zanzibar in good health August 8, 1868. He had been spending the year previous exploring the country south of Tanganyika lake, which he found to contain many small springs, which he claims to be the true sources of the Nile. He requests furtber supplies of necessaries, including nautical instruments and copies of almanacs for 1869 and 1870. Tbis indicates that he proposes remaining in the country a long time.

Reading for the Hour.

Accidents.

We pride ourselves on being a peculiarly "go-ahead sort" of people in this State, and that when we once have commenced a work we put it through in a rapid manner. Not having had railroads for any great length of time, our advantages in the line of railroad disasters have hitherto been limited; but apparently we are now making up for lost time; and if our proper amount of people are not killed off, it will be no fault of ours. Gunpowder and nitro-glycerine explosions are also getting to be the order of the day; and the reporters of the daily papers have full scope now for the exercise of their descriptive powers. We expect soon to have the half of San Francisco burned down. It would be a good idea to import a large amount of arsenic, so as to have it handy; and there are a thousand other little tricks which will readily occur to the mind of the thinking man.

There is a little motto which we all have heard, which we consider to contain a good moral, and which we all remember to forget. This little motto used to be (it may have changed since we came to this State): "the want of care does more damage than the want of knowledge." Inventors may increase and multiply their patent safety-signals, powder, matches, valves, and other apparatus; but as long as we persist in being careless, we may laugh their efforts to scorn.

The Pope and the Roman World's Council.—Œcumenical councils seem to have "fallen through" for three centuries preceding the present month (December). Probably the desired results have been found more easily accomplished in some other manner. The questions and dogmas before the religious world recently brought to a definite form by Pius the Ninth's syllabus of modern errors, and the character of the Pope and the position of the ancient Catholic Church in the light of modern civilization, were very ably discussed by Prof. Theobald at his recent lecture at the Mercantile Library. He showed by a most graphic picture of the individuality, private character, antecedents, and of the election of Pius IX. to his position, how and why his grounds are taken thus and so; and how inevitable it is that the Œcumenical Council will prove conservative on what we understand to be dogmatical catholicism. The liberality of American and ultramontane bishops will not inaugurate any material change to "march with the age."

The "Great Delinquent."—Who is the great unknown whose name appears so frequently and oft-repeated (with the word "trustee") in the delinquent lists of the various stock companies, advertised in the city papers? Almost every mining company seems to delight in the sight of this name. Such frequent mention would have raised Barnum to the seventh heaven of happiness, and the thought that it costs the fortunate owner nothing, must cause the King of Paiu to groan with envy. Is he rich or is he poor—"to be, or not to be?" In the name of "Common Sense," is mining profitable? Will not the "Hills" in the "mineral county of San Francisco" continue to "pay?" Pick.

Chicago on the Brain.—The papers are greatly exercised on the subject of Chicago just at present, and much complaint is made by merchants, that Chicagoans are usurping their business and taking it out of the State. We suggest that business men here take example from the action of Wells, Fargo & Co. with regard to the Pacific Union Express;—buy up Chicago, and then raise prices.

Artificial Geysers.

The Geysers of Iceland are familiar to all as being among the wondere of the world. Much has been written about them, and varied have been the speculations in regard to their cause; the wildest theories having at times prevailed. The attention of scientific men was called to the subject, and after various ideas had gained ground and been refuted, Prof. Bunsen, of Heidelberg, arrived at satisfactory conclusions, which were tested experimentally by Prof. Muller, of Freiberg, and found to be satisfactory. Although these experiments were made several years ago, and are well known to scientific men, yet they may be new to some of our readers, and all the more interesting as we too have Geysers on a smaller scale in California, which are reckoned among the wonders of the State.

Immediately after an explosion of the great Geyser of Iceland a large basin, some 50 feet in diameter, is left bare. In the middle of this basin is a cylindrical hole or pipe, which sinks deep into the ground. In this pipe one can see the water calm and still as in any spring. Soon the water rising in the hole fills the basin with almost boiling fluid. After a certain time is heard an underground noise, as of thunder, the surface of the water commences to boil and hies; then quiet ensues for awhile, when the phenomena occur again with greater force. This is repeated with greater or less power, generally for the whole day, at pretty regular intervals. Then comes a change; the thunder becomes louder, the water boils in powerful commotion; thick vapors arise, and suddenly a stream of water is thrown some 80 to 100 feet into the air; as suddenly all becomes quiet again, and as the vapor passes off we see the empty basin again.

Prof. Muller imitates this by means of a very simple apparatus—a tube whose upper end terminates with a large basin. The tube and basin are filled with water, and then the lower part of the tube is strongly heated, when similar phenomena occur as in the case of the natural Geysers.

The explanation is equally simple. The water, which continually rises in the tube, has below, under the pressure of the column of water above, a far higher temperature than exists in the upper part. If now this very hot mass of water rise suddenly, and under a less pressure than that which corresponds to its temperature, it is instantly changed into steam, and violently throws into the air all water in the tube and basin above it, whereby the following masses of water, likewise freed from a part of the pressure, are as suddenly changed to steam. This continues until the water which is thrown up and falls back into the basin is so far cooled that it prevents further formation of steam. Then all is quiet until this cooled water is again sufficiently heated by the rising stream to allow of further steam formation.

This very simple and interesting experiment has, we see, been lately exhibited at a lecture in England; and, as it requires no costly apparatus, can be tried by any one who has an experimental turn of mind.

Report says, and there is reason to believe correctly, that the Eureka mine, Grass Valley, has been sold for $1,200,000.

How "Marbles" are Made.

The chief place of the manufacture of "marbles," those little round pieces of stone, which contribute so largely to the enjoyment of "Young America," is at Oberstein, on the Nahe, in Germany, where there are large agate mills and quarries, the refuse of which is carefully turned to good paying account, by being made into the small balls employed by experts to knuckle with, and are mostly sent to the American market. The substance used in Saxony is a hard, calcareous stone, which is first broken into blocks, nearly square, by blows with a hammer. These are thrown by the one hundred or two hundred into a small sort of mill, which is formed of a flat, stationary slab of stone, with a number of concentric furrows upon its face. A block of oak, or other hard wood, of the same diametric size, is placed over the small stones and partly resting upon them. This block or log is kept revolving while water flows upon the stone slab. In about fifteen minutes the stones are turned to spheres, and then, being fit for sale, are henceforth called "marbles." One establishment, containing only three of these rude mills, will turn out full sixty thousand "marbles" in each week. Agates are made into "marbles" at Oberstein by first chipping the pieces nearly round with a hammer handled by a skilled workman, and then wearing down the edge upon the surfaces of a large grindstone.

Benefit of Laughter.—Probably there is not the remotest corner or little inlet of the minute blood-vessels (life-vessels) of the body, that does not feel some wavelet from that great convulsion (hearty laughter) shaking the central man. The blood moves more lively—probably its chemical, electric, or vital condition is distinctly modified—it conveys a different impression to all the organs of the body as it visits them on that particular mystic journey when the man is laughing, from what it does at other times. And so, we doubt not, a good laugh may lengthen a man's life, conveying a distinct stimulus to the vital forces. And the time may come when physicians, attending more closely than at present unfortunately they are apt to do, to the innumerable subtle influences which the soul exerts upon its tenement of clay, shall prescribe to a torpid patient "so many peals of laughter, to be undergone at such and such a time," just as they now do that far more objectionable prescription, a pill or an electric or galvanic shock; and shall study the best and most effective method of producing the required effect in each patient.

The trial of Kane, the switchman, who has been popularly supposed to be the cause of the disaster on the Western Pacific Railroad, has been concluded and the accused discharged. The final argument of the counsel for the defense, as reported in the papers, was peculiar, powerful and pathetic. It was "small potatoes on the part of the Coroner's jury to pitch into a poor Irishman who could not be expected to know anything. The Lord had denoted who was the guilty party by killing off the engineer (also a few passengers who had no business to be on that particular train), and the sympathies of the people ought to be with the accused, because it was an expensive job to try a man." Evidently the learned counsel for the defense does not consider that an Irish Kane is a responsible keeper of his brethren.

The discovery of fossils is getting to be the rage. We hear continually of such discoveries in all parts of the State. If some of the geniuses who are so fond of this branch of science, would visit San Francisco, they would find a large field for exploration. The difficulty here, however, is not to find, but to get rid of these fossilized remains.

The dispute between the Union and the Central Pacific Railroads has at last been settled. The junction is to be at Ogden. At this place the branch routes to the South and to the North are to connect probably, thus giving neither of the Pacific roads an advantage over the other.

Legislation Without Politics.

We are a progressive people and look confidently about us for improvement in all new things—and prominent just now, the incoming Legislature shares our attention.

The present condition of the mining counties in this State, their residents burdened with taxes, which in some instances exceed the actual rental of money in other States, is a lesson to legislators and the people of every county which should not be passed without consideration. These burdensome debts, which expel capital and enterprise, and retard the progress of the State, were all incurred in strict conformity with law, or it is very certain their payment would be evaded.

Legislators of the Past.

A study of the class of men by whom the laws were passed, which authorized the creation of those debts, which have brought counties to the verge of bankruptcy or repudiation, will be exceedingly instructive. It will show that the people of many counties are only reaping the results of their folly in selecting men to act as legislators who were unqualified by age or experience to manage any business. They could not expect better results.

The ability to frame laws to protect the diversified interests of so large a State as California, is not to be found among that class who manage to make themselves useful to the leaders of political parties; yet it was largely from this class that legislatore were formerly selected in every county in the State. The results, if not felt as severely in the commercial or agricultural, as in the mining districts, are the same, and must finally culminate in disaster.

The history of every great swindle imposed upon the people by legislative enactment, as well as of those that have been prevented by the exposures of the press, are precisely alike. The prime movers in the scheme for robbing the people "according to law," have their associate agents in all the counties interested. These agents select ambitious, unscrupulous young men, having but little, if any pecuniary interest in the State, who are nominated for the Legislature at party conventions, and too often elected. Such men, when in the Legislature, are the docile, obedient creatures of the clique that nominated them, never heeding the interests of the people whose votes elected them.

There is not a county in the State but has cause to regret having sent worthless men to the Legislature to make laws. There is not a community that has not a record of some of these fellows, who have "sold out" the people that honored them. Scores, if not hundreds, of "members" of the Legislature of this State—hailing from the various counties from Siskiyou to San Diego—can be counted, who never returned to their constituents.

In not few instances, honest, well-meaning young men have been sent to the Legislature, to help them along in the world. Their election has generally been their ruin; the corrupting influences with which they come in contact, unfitting them for honest labor or business thereafter. Professional politicians are the worst kind of law-makers.

Legislators for the Future.

It is earnestly hoped by every true friend of the State, that the Legislature opening in Sacramento on Monday next, may prove an exception to the general rule. It comes into power with a great majority on one side, and it is expected that it will exert its influence to further the material interests of the people. Let it guard its political principles, but not at the expense of the people's rights. The financial, commercial and productive resources of the State are not as elastic and buoyant as in days of yore, and it is imperative that there should be a greater economy in the expenditure of the public funds.

Legislators may make an honorable record by holding a short session, passing as few laws as possible, and those only to aid in developing the latent resources of the State. Swindling the people by special legislation is a curse that will entail defeat and infamy on any political party. Give us laws independent of politics.

Entering a new capitol it is a fitting time for our law-makers to turn over a new leaf, and give us wholesome, instead of ruinous legislation. Let every legislator act for the right, independently of others, and the people will bear him out. Times are changing fast in our State, and miners, farmers, and all industrious and intelligent voters will hereafter hold their chosen servants to a more strict account.

San Francisco:

Saturday Morning, Dec. 4, 1869.

Notices to Correspondents.

MINER, Spanish Ranch.—There is a calcium light, but the necessary apparatus for this is expensive. You will find some remarks on the subject of "Light for Hydraulic Mining," in the PRESS, March 27, 1869, a copy of which has been sent to the address of "Miner," Spanish Ranch. We would take this occasion to say that we do not usually take any notice whatever, of anonymous communications. "Miner" should have sent his personal address.

"O. M.," Nevada.—An illustrated description of the Stetefeldt furnace will be given next week, in which the difference between that and the Gerstenhoffer furnace, as employed in Freiberg, Mansfield, etc., will be pointed out. We do not know of any English work of the character you desire, extant.

"THE Mines the True Source of Wealth of California," has been received, and is awaiting an examination.

THE STETEFELDT Furnace in Reno will appear next week.

"HYDRAULIC MINER" will be answered next week.

The Fatal Explosion at Smartsville.

Lyman Ackley, a prominent mine owner, writes from Smartsville, Nov. 25th, relating to the late sad accident with Hafenegger powder in that place, stating that the wounded man, Leszinsky, will not lose his eyesight, and that he is improving fast. He also adds:

"I have talked over the whole matter of the explosion with him and the men in the tunnel—that is, the contractors—and they conclude that one of the candles must have fallen and ignited the powder in the can from which they were loading. The hole that Schmidt was tamping with the iron bar was not discharged. The accident occurred from gross carelessness, and would no doubt have occurred with any powder."

Mr. James O'Brien, owner of the tunnel in which the explosion took place, says that on examination he found one hole loaded in the right hand corner of the tunnel on the roof, with No. 2 powder, which he touched off, resulting in good execution. The middle hole, 3¼ feet horizontal, was partly loaded by pouring in loosely No. 1 (strong powder used with fluid), contrary to rules. This was also exploded separately, and did good work. Mr. O'Brien corroborates the conclusion expressed by Mr. Ackley above, and urges Prof. Hafenegger to return and proceed with the use of his powder, offering him facilities for hank and hydraulic blasting, for which purpose he considers the powder particularly desirable.

NEW HYDROMETER.—M. Baudin has constructed a new hydrometer in which the strength of the spirit is measured by its expansibility. A thousand measures of absolute alchohol at 50° becomes a thousand and seventy nine at 170°, or a little below its boiling point. With mixtures of alcohol and water the rate of expansion is not uniform; but M. Baudin's tables have probably been constructed upon special experiments.

Alphabetical List of Members of the California Legislature.

SESSION COMMENCING DEC. 6, 1869.

SENATE.

Banvard, E. M. (D.)—Placer.
*Beach, Horace (R.)—Yuba.
Betge, R. J. (D.)—San Francisco.
Burnett, William (D.)—Sonoma.
*Chappell, J. N. (R.)—Shasta and Trinity.
Comte, A., Jr. (D.)—Sacramento.
*Conn, Wm. A. (D.)—San Diego and San Bernardino.
*Conly, John (R.)—Butte, Plumas and Lassen.
*Curtis, N. Greene (D.)—Sacramento.
Farley, J. T. (D.)—Alpine and Amador.
Fowler, Thomas (D.)—Fresno, Kern and Tulare.
*Green, James J. (R.)—Contra Costa and Marin.
Gwin, W. M., Jr. (D.)—Calaveras.
*Hagar, John S. (D.)—San Francisco.
*Hunter, George W. (D.)—El Dorado.
Hutchings, S. C. (D.)—Sutter and Yuba.
Irwin, William (D.)—Siskiyou.
*Kincaid, H. (D.)—San Francisco and San Mateo.
Larkin, Henry (D.)—El Dorado.
*Lawrence, James H. (D.)—Mariposa, Merced and Stanislaus.
*Lewis, E. J. (D.)—Tehama and Colusa.
Maclay, Charles (D.)—Santa Clara.
*Mandeville, J. W. (D.)—Tuolumne, Mono and Inyo.
*McDougall, F. A. (D.)—Monterey and Santa Cruz.
Minis, William (D.)—Solano and Yolo.
*Morrill, D. L. (R.)—Calaveras.
*Murch, L. H. (R.)—Del Norte, Humboldt and Klamath.
O'Connor, M. P. (D.)—Nevada.
Pacheco, Romuald (R.)—San Luis Obispo, Santa Barbara.
Perley, J. E. (R.)—San Joaquin.
Perkins, G. C. (Ind. R.)—Butte.
*Pendegast, W. W. (D.)—Napa, Lake and Mendocino.
*Roberts, E. W. (R.)—Nevada.
*Saunders, J. H. (D.)—San Francisco.
Tompkins, Edward (Ind. R.)—Alameda.
Turner, H. K. (R.)—Sierra.
*Tweed, Charles A. (R.)—Placer.
Wand, Thomas N. (D.)—San Francisco.
Wilson, D. B. (Ind.)—Los Angeles.
Wing, J. D. (R.)—Tuolumne, Mono and Inyo.

ASSEMBLY.

Andrews, A. R. (D.)—Shasta.
Appling, E. (D.)—Fresno.
Berry, O. P. (D.)—Sutter.
Biggs, Marion (D.)—Butte.
Blakenship, J. A. (D.)—Monterey.
Brown, A. C. (D.)—Alpine and Amador.
Brown, J. E. (D.)—Yuba.
Calderwood, M. H. (R.)—Placer.
Carothers, J. H. (R.)—Contra Costa.
Coronel, W. F. (D.)—Los Angeles.
Crigler, J. C. (D.)—Lake and Napa.
De Haven, J. J. (R.)—Humboldt.
Doss, E. W. (D.)—Tulare and Kern.
Duffy, J. A. (R.)—Sacramento.
Ehrelroy, W. E. (D.)—Tuolumne, Mono and Inyo.
Escandon, A. G. (D.)—San Luis Obispo, Santa Barbara.
Finney, S. J. (R.)—San Mateo.
Fortune, H. W. (D.)—San Francisco.
Freeman, J. F. (D.)—Sacramento.
Fryer, R. C. (D.)—Los Angeles.
Gildea, Chas. (D.)—El Dorado.
Green, E. L. (D.)—Calaveras.
Griswold, John C. (D.)—San Francisco.
Haile, R. C. (D.)—Solano.
Hawley, B. F. (D.)—Nevada.
Hayes, Geo. R. B. (D.)—San Francisco.
Hayes, Michael (D.)—San Francisco.
Henley, Barclay (D.)—Sonoma.
Henley, G. W. (D.)—Mendocino.
Hihn, F. A. (Ind. D.)—Santa Cruz.
Horan, M. S. (D.)—Sacramento.
Hubner, C. G. (D.)—San Joaquin.
Hudson, Thomas (D.)—Sonoma.
Inman, Daniel (Ind. D.)—Alameda.
Johnson, J. M. (D.)—Alpine and Amador.
Kelly, J. M. (D.)—Yolo.
King, W. A. (D.)—Nevada.
Koutz, John, (R.)—Sierra.
Lambert, John (D.)—Lassen and Plumas.
Lewelyn, E. D. (Ind. R.)—Alameda.
Martin, J. N. (D.)—Butte.
Martin, R. M. (D.)—Siskiyou.

ELECTRO-PLATING WITH IRON.—Hon. Cassius M. Clay has returned from St. Petersburg with some fine specimens of iron electro-types, taken by the process of Jacobi and Klein. We have spoken of this process before. A thin coat of copper is first deposited, which, after the deposition of iron, is removed, either by mechanical means, or by immersion in nitric acid. The brittleness of the iron coat may be corrected by subsequent annealing. The Russian Government now employs the process in the printing of bank notes.

LATEST dispatches from Liverpool quote wheat at 9s. 10d.—an advance on previous quotations the past week.

A Problem.

Given—A certain railroad. *Required*—to travel over it without getting damaged.

A very simple problem to read, but one which has the peculiarity of becoming more and more difficult every day, and which demands a very complicated answer: for it is getting more and more apparent that in these times we must trust little in man, but rather find some mechanical means, by which the possession of any knowledge or care on the part of the employés of the road may be rendered unnecessary. Engineers have long been at work perfecting their answers, but the longer they work, the more, they find, is demanded. New points are discovered in which there are defects, and as the knowledge of these defects is gained at the expense of some one's life, the problem gets more and more interesting.

Lately, a very interesting paper on this topic was read before the New York Society of Practical Engineering, by Mr. C. Williams, C. E., and we give our readers the solutions of this gentleman on several of the important points. The main object of the paper was to point out such improvements in materials and construction as would overcome the principal difficulties.

Few articles manufactured of iron have to endure more than the rail. Not only is it subjected to a heavy load, but this load is imposed in a series of violent shocks; and, moreover, there is the wear and tear of the part of the rail exposed to the influence of the driving-wheels of the engine. The difficulty has been to impart to the surface of the rail the qualities which would enable it to resist injury in a degree commensurate with that exerted by the contiguous parts. Mr. W. recommends the use of a compound rail, or a rail constructed with a surface of steel, but with the bulk or body of soft iron, wherehy the fracture of both parts in the same place becomes almost impossible, while the hard steel surface gives it the required durability. Such rails would cost less than those wholly of steel, he as lasting, and much safer. He recommends also the same combination for axles—a hollow axle of soft iron with a steel core. The same can be applied to wheels, giving them steel tires. This has been adopted already for locomotives.

The delay of a few seconds in applying the brakes has often caused serious disasters, which otherwise might have been avoided. This delay, often protracted hy the tardiness of the brakesmen in responding to the alarm-whistle, can and ought to be avoided by the use of steam-brakes under the control of the engineer, who is, of course, the first to discover danger. The remedy proposed for avertiug disaster resulting from misplaced switches, is similar to that which has rendered accidents from open draw-bridges seldom, and is simply a legislative enactment that all trains shall slacken the speed to about four or five miles an hour on approaching any switch.

Mr. W. contends that the use of wood in constructing cars is an outrage on the progressive spirit of the age. Paper even, such as used for paper boats, would be better material, being less liable to catch on fire and impossible to splinter. But iron cars were the desideratum of the age, and would yet he forced upon railroad incorporations by an irresistible public sentiment. We have iron houses, iron steamboats and iron sailing vessels, and we ought to have iron railway coaches. We agree with Mr. Williams, and if we *must* take part in a collision or an overturn, we prefer to take our chances in an iron car, even if it does cost the railway company something more, which we are not as yet sure it would.

To prevent the cars from getting off the rails, it was proposed to lay a third or middle rail, somewhat higher than the others, and so constructed that, by means of friction-rollers on each side, the lateral motion of the cars would be prevented—a proposition not new, and which we are afraid will not strike most persons favorably.

The last principal suggestion was for deadening the force of a collision. The platforms are to be somewhat longer than is now common, and so arranged that they will he driven *under* the car floor against atmospheric or hydraulic buffers. Thus, before two cars can impinge on one another, the force of the collision will have to work on the buffers throughout the length of both platforms. For greater safety, a buffer car, or a car composed of a system of buffers, might he used with each train. With such a car, and buffer platforms, Mr. W. seems to think that a collision might occur without damage to the passengers or the passenger cars. We feel by no means so confident as Mr. W. on this point. The force of a train in rapid motion is immense, and this force is not always exerted in an exactly horizontal line, on accouut of the inequality of the track. This is shown by the telescoping of cars, for instance—one car being slightly raised and then dashed through the next above its floor. Now, this small rise alone would neutralize the effect of the buffers. We give this, not as the only objection, but as the one which first occurs to us on reading over the report. However, we leave the further discussion of the subject to others, who will find in Mr. Williams' paper much food for thought.

Mechanics' Institute—Monthly Meeting.

The regular monthly meeting of the Mechanics' Institute was held at their hall, on Post street, on Thursday evening last. Mr. Hallidie said that the Directors, to whom was referred the incorporation of the Institute, would tender a report at the next regular meeting.

In answer to a question by Mr. W. B. Ewer, whether the Institute had been benefitted hy the system carried on during the Fair in regard to season tickets. Mr. Hallidie stated that by affixing certain numbers to season tickets, denoting certain prominent characteristics of the holders, the Society had saved nearly $3,000.

It was moved by Mr. W. B. Ewer, that the Board of Directors be directed to tender to the Secretary, George Pardy, the originator of the ticket device, the sum of $200, or its equivalent in some testimonial, as a mark of regard for his services in the interest of the Institute. The motion was carried hy a unanimous vote.

Mr. Hallidie then introduced to the meeting Mr. Hubert Burgess, who gave a very interesting lecture upon Drawing and its various branches—prospective, ornamental, and scroll—illustrating the same in a very able manner on the blackboard. At the conclusion, a vote of thanks was unanimously tendered to him; also, an invitation to continue the subject at some future meeting; and he signified his willingness to do so, due notice of which would be given. Mr. Hallidie said it was their intention to continue these lectures, and make them as interesting as possible to all. Also, as soon as the Directors were able to command the means, to have a Polytechnic School connected with the Institute.

New Incorporations.

SUTRO TUNNEL CO.—Nov. 29th. Capital stock, $12,000,000; divided into unassessable shares of $10 each. Trustees: Samuel Merritt, Michael Reese, Abraham Seligman, Wm. H. Sharp, Joseph Aaron, John B. Felton and H. Baroilhet.

"LA SOCIEDAD LATI-HISPANO-AMERICANA."—San Francisco. Dec. 2. The objects of the Society are the protection of the Latin, Spanish, and American population of the State of California. Trustees: Marcelino Martinez, Vincente Arechiga, Francisco N. Guiterrez, Johu A. E. Green add J. R. Pico.

MARTIN VALLEY FLUME, WOOD AND LUMBER CO.—Nevada County. Dec. 2. Capital stock $120,000.

CORRECTION.—In our illustrated article last week, under the sub-head of "Costs of Mining," we should have said: "The whole costs of miuing varies from £2 to £100 per fathom on the vein." Several lines below, "12 lbs. of tin" should have read "12d.," and "$4" was written "4s."

The Manufacture of Preserves.

Primitive Methods and Causes of Preservation.

All articles of food beiug organic are subject to decay, the reason being that their chemical elements are held loosely in combination, and are continually seeking to form new and more stable compounds. It requires no very great power of observation to perceive that the change varies under different circumstances and influences, and it is not uninteresting to see how the preservation of food has been gradually perfected from early times up to the present day. One of the simplest facts, and the most easily seen, is that the presence of water, or of almost any fluid, facilitates decomposition. Hence at an early date, and among uncivilized nations of the present day, the remedy of driving off moisture by fire or by the heat of the sun was readily recognized. The Indians treat thus buffalo and deer meats. The use of salt—which abstracts moisture from bodies in contact with it—has long been practiced, and salted meats and fish have long been common. Then sugar was found to have a similar effect. The use of vinegar was shown to preserve certain articles by rendering the albumen—the easiest compouent to putrefy—inert; but articles thus preserved are difficult of digestion, and are used principally as appetizers; as pickles, etc.

The above remedies, with the exception of vinegar, are applicable only to animal food; and experience soon taught that complete abstinence from vegetable acids induces scurvy. Hence attention was paid to the preservatiou of fruits and vegetables. For this it was found that common air or oxygen must be excluded. Thus, grapes can be kept a long time in sawdust, provided the skin is not broken. And now a great step was taken. Some 60 years ago we find that a Frenchman, M. Appert, was awarded 12,000 francs by the French Government for inventing the

Parboiling of Provisions

And then confining them in air-tight cans. His process, as improved by a couple of English firms, is now in general use, and has proved of immense importance. The essential points of the method are these: that the article to be treated is placed in an open can and boiled a certain length of time. The can is then immediately closed hermetically, while the hot gases still prevent the entrance of air. For greater safety the closed cans are again treated to a boiling, the object of this being to change any oxygen which may possibly exist in the can to carbonic acid.

The preservatiou of vegetables, fruits, fresh meats, etc., immediately began to be an important branch of industry, and this business has been continually increasing.

In San Francisco

Several firms are engaged thus, and a walk through the large manufactory of Messrs. Cutting & Co.—the largest and oldest of these firms—convinced us that the work was done on a larger scale than we had previously imagined. At the time of our visit tomatoes were being canned, and in the packing room were seated at tables workmen—of whom, in the busiest season some 500 are employed—engaged in peeling and cutting this fruit, each table being under the immediate superintendence of a foreman. The peeled tomatoes were placed in the cans and carried by a man to an adjoining room, where the cans are placed in large tanks partly filled with water, which is brought quickly to the boiling point by the introduction of steam. After a short time the cans are removed, and immediately closed. Being of an inquisitive turn of mind, and not having partaken of any lunch previously, we had determined to test the article before and after cooking; but unfortunately we had satisfied our curiosity too fully with the unboiled substance, and forgot to insert our digits into the hot can.

The cans are now transferred by man and steam power to the upper story of the adjoining warehouse. Here they are tested and labelled with the handsome chromolithographs which are intended to render the exterior as attractive as is the internal substance. To box up the cans and label the boxes is all that is required to make everything ready for the market.

Not an unimportant part of the business is the

Manufacture of the Cans,

Which is carried on in the story above the packing room. Here are engaged some 45 men—one class cutting the tins into sheets of the proper size, another cutting out the blanks, which are punched into the right shape for the tops and bottoms; still another rolling up and soldering the cylindrical body of the can. Here is a man with lightning rapidity attaching the top to the body, inserting a ring of solder, and dipping the can into resin, which adheres to the rim. Place the can on the patent stove invented by Mr. Cutting, and the solder and resin are immediately melted. Then attach the bottom in a similar manner, and the can is made. The quickness of the whole process, due greatly to the economy of time attained by the use of the patent soldering apparatus, is such that these 44 men can turn out 10,000 cans in one day.

Out in the yard we hear the coopers pounding away on casks and barrels for the pickles, the cider, and the vinegar. In former times, with proper visionary power, we might have seen glassblowers—some blocks away—making the bottles; but this branch of the business has been taken by other parties and extended.

Preserved Salmon.

In addition to the manufactory in this city, Messrs. Cutting & Co. have quite a large establishment at Eagle Cliff, on the Columbia river, where large quantities of salmon are packed. Hence some 60 men are engaged in all the different branches of work, from the catching of the fish to it preparation for market. This article is getting to be more and more extensively used as people find how well all the delicate flavor can be maintained.

Think of the farmers around Oakland and Alameda, up at Napa, in Sonoma and Santa Clara counties, engaged in raising the thousands of baskets of peaches, pears and plums, the tons of tomatoes, of cucumbers, of currants, blackberries, cherries, grapes and other vegetables and fruits; think of the wood-cutters in Oregon and Michigan cutting the fir and the oak for the barrels; think of the miners in Cornwall digging out the ore, smelters reducing it to metallic tin; of the many heads and hands engaged in providing the preserves you are eating; and if you please you can remember the thousands of stomachs which are supplied with sustenance—the result of one man's thinking some 60 years ago.

From the Pacific to the Atlantic.—The Post-Office Department is keeping a register of the time occupied in the transmission of mails between Boston and San Francisco. The time has been gradually shortening, since through trains have been established to this city. The average time is now about seven days and nineteen hours. The time between New York and San Francisco now averages about six days and fifteen hours.

San Francisco Hotels.—San Francisco is in a fair way to be pretty well supplied with "first-class" hotels. We have now the Occidental, valued at $1,000,000; the Cosmopolitan, $975,000; the Lick House, at $800,000; and we shall soon have the new hotel, now rapidly approaching completion, on the corner of Market and New Montgomery streets, which will cost $1,000,000. This will do very well for a 20-year old city of 160,000 inhabitants.

Mining in Placer County.

[Written for the Mining and Scientific Press.]

Editors Press:—When at Colfax, I visited the Rising Sun Q. M. Co., which has a small five-stamp mill, but it was not running at the time I was there, having suspended for a short time to make repairs. This company has made some very excellent runs within the past six months. Their rock looks well, shows much free gold, with good-looking sulphurets, which also assay well. They have done but little as yet towards developing their mine, as their shaft is down only about twenty feet.

Iowa and Wisconsin Hills.

From Colfax I went to Iowa Hill, about half a mile from which I visited the cement claim owned by the Morning Star M. & M. Co. They have a fine ten-stamp mill, built by J. G. Bishee, which commenced crushing gravel about three months ago. The mill is run only during the daytime. The foreman, Mr. J. Mitchell, accompanied me through the mine. Passing into the tunnel about 400 feet, we found some eight or ten miners picking away at the cement. The mine is worked night and day. Gold was readily discovered in the cement. I was informed that there are twenty-four shares in the company, and that a majority of the shareholders are workingmen. They clean up from fifty to one hundred ounces. [Our correspondent does not say how often.] They find that it pays to work from eight to ten feet into the bed-rock in this mine—a very unusual occurrence.

There are other placer claims near this locality, owned by W. Wisler and others, upon which preparations are being made for winter's work. At Wisconsin Hill, two miles distant, there are some very large claims; but they are not worked at present for want of water.

Mr. O. J. Spencer's (Mt. Pleasant) sawmill is actively at work sawing out blocks for sluice boxes. These blocks are from two to three inches thick, and are affixed to the sides [and bottoms?], by the use of which the boxes are made to last three times as long as without. The first cost is a little more, but the saving in the end is considerable.

Damascus.

Twelve miles more brings the traveler to Damascus, another small mining town. Here I found two companies operating quite extensively. The Mountain Gate Co. have an old tunnel in some 3,500 feet, and have just completed a second, lower down the hillside, which is now in over 3,000 feet, where the cement is paying well. The mine is owned by twenty-three shareholders, every one of whom is a shareholder, and does his regular day's work upon the claim. Twenty-two were at work the day I visited the mine. The last clean-up, after a two weeks' run, gave them 120 ounces of gold. They are not now employing any extra hands; but soon will do so. Such a company is bound to succeed. There is no business in the world where coöperation, under good management, will succeed better than in mining.

The next mine visited was the Lewis claim—an old claim, containing very hard cement. The company have a tunnel in some 700 feet. They have at present only six men employed. The old company erected a mill, some years ago, at a cost of $30,000. The cement is taken out and dumped in a pile, where it is left eight or ten days to "stocken," when it is worked in sluices. I understood it was the intention to commence crushing soon; but why they do not crush at present I did not learn. I see no reason why the claim should not be a valuable one.

Michigan Bluffs.

From Damascus I passed on to Michigan Bluffs, where I found the various companies making extensive repairs and getting ready for winter work. Messrs. Erman & Co. have paid $19,000 for a ditch, and bought some very valuable mining ground for $3,000. They have half a mile of main tunnel, besides numerous side drifts. There are many miners working, and doing well at the river, and up the cañon. Mr. J. W. Richards, a well known miner of this place, recently fell, and catching at a large rock, it rolled over upon him in such a manner as to break his leg in three places. He expects to be all right by the time the water comes in for winter work.

M.

Beauties and Novelties in Southern Hawaii.

The soft tradewind murmured up and down through the deep forests, or lighter groves of limes, guavas, oranges, and bananas. There were blossom-filled vales, where, if some *genie* should suddenly envolve himself from the morning mist, you would not be in the least surprised; nooks, where the heavy odors of tropic perfumes lingered; streams, gurgling in and out, bearing up large, sleepy lilies, under whose broad, white leaves the gold-fish rested. You stop and watch these shining creatures in their own home and element. All that you have seen before were imprisoned exiles, slaves, in the make-believe liberty of the *aquarium*. They lie, in gleams of gold and silver, on the brown pebbles at the bottom, whose woudrous glows of brown and ochre you can see through the lucent water. Splendid parasites leap from branch to branch, twining the woods together in flowery bands, or running over the ground, making patches of violet, carmine, and gold. And ever, at intervals, from some breezy slope, you see the sea, spread out in its sublime magnificence, bent over by a sky of such dreamy loveliness, such pure beauty, that the divine may well dwell beyond it.

Seven miles up this valley, on a sunny afternoon, the earth suddenly opened in a fissure of two miles in length, and from it rose a vast column of liquid lava, jetting up in conical spheres of flame over a thousand feet in height, and pouring its resistless tide of destruction to the ocean. It swept everything in its fatal course; houses, with its doomed inmates, horses, cattle, and whole herds of goats. The story of the white settler's family is well known: how, just ten minutes after they escaped from their home, the fiery sea swept over it. We rode over the spot a few weeks later, and then could see the scarlet fire through the dark fissures. So singularly swift does surface lava cool, retaining its fires beneath the crust, that trees at the edge of a lava stream will have only those branches burned that are nearest to it.

The upper valley looked exactly like the bed of a great crater. There was the same sea of black billows, storm-lashed and frightful, covered with the same curling blue smoke; there were the same chasms gaping everywhere, though here not so great in depth, but from which oozed the same sulphurous gases.

Often, when the crust cracked and yielded beneath our weight, we expected to go through. Some of the party declared that it was a temptation of Providence, and wanted to go back; but the Kanakas rode on fearlessly, and we had come too far to be swerved by possible danger. So on we went, though it was pitiful to see the bleeding legs of the panting horses, scorched and cut by the hot, sharp lava. In many places, the heat was so intense that we could scarcely breathe; and having our mouths muffled, for fear of sulphur steam, we went through an hour's semi-stifling before the goal was reached.

It was a long, hideous chasm, emitting rapid columns of steam and smoke, and holding as yet its fires in active force. We approached as near as we dared, and threw blocks of cool lava into it; but the smoke was too thick to see far down, and the roar too great to judge its depth by the falling rocks. We were obliged to leave this opening very soon by a cloud of nauseous gas; and this, as the natives assured us, would be swiftly followed by other deadly poisons.

We followed the course of the main torrent back until it divided into four streams, reaching the ocean in long, wide channels of broken, smoking lava. One may judge the force of this eruption by the fact of its forming a new beach, extending a mile into the water, at the extremity of which an island was thrown up—black, frowning desolate—looking like one of the monster cones transplanted from Kilauea. Nothing is more awful than a landscape black with lava, or gray with ashes and pumice cinders. It rises in huge ridges, heavy boulders, and inky breakers, gleaming with metalic lustre in the sun. It spreads far and wide from mountain-base to the sea, a dark repetition of sunken pits, fresh crater-beds, yawning chasms of hideous danger, walls of broken lava, and whole miles of volcanic sands, ashes, and "clinkers." The very mind wearies of it at last, and one wonders how the sweet breeze can blow over it or the calm heavens look down as serenely as if it only gazed on pastoral scenes, dotted with drowsy goats and sheep, and glittering with morning dew.

—"*In Lava Land*," *Overland Monthly*.

PERFECT ACCURACY NOT ATTAINABLE.—No two persons do a given thing exactly alike. No two see a telescopic appearance with the same quicknoss. In astronomical observation the habitual error of any given person in recording the instant of an event is ascertained as nearly as possible, and the formula expressing it is called the *personal equation*. This is allowod for by reducing all observations, and will generally be found pretty nearly constant. It amounts in some cases to one-half a second.

The British mint allows twelve grains to the troy pound for variation in weight in coining; and this may be taken perhaps as the measure of the nearest approach to mechanical accuracy in coining. It is fifteen seventy-seconds of one per cent.

The variable textures of the materials used and the different thermometric and hygrometric conditions of materials and tools, all tend to defeat accuracy. There are scarcely any two days in the year when a boxwood rule is precisely of the same length, and the variations in metallic rules are even groator. Surveyors find errors creeping into their measurements from the expansion of thoir chains; and we might go on to show that the material or implement can be made entirely free from one or the other of these adverse influences.—*Scientific American.*

NOW AND THEN.—One hundred years ago it took six months to fix quicksilver to glass, for mirrors; that object is now better accomplished in forty minutes!

CLARENCE KING found a mountain opposite Tulare lake, in Kern county, 17,000 feet in height.

BOOK ON EARTHQUAKES.—A Treatise on Earthquake Dangers, Causes and Palliatives, by Prof. Thomas Rowlandson, comprising Earthquake Dynamics; Earthquake Waves, Sound that attends Shocks, Lime, Mortar, etc., Cosmogony and Seismogony, Phenomena of the Neapolitan Earthquake of 1857, and General Observations respecting Structural Arrangements. Published by Dewey & Co., Mining and Scientific Press Office, San Francisco, 1869, containing 96 pages. Price 50 cents, postage free.

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Metallurgy.

MOSHEIMER'S
Pioneer Mining School
—AND—
METALLURGIC WORKS,
ESTABLISHED .....1858.
Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to work any kind of ore, or mineral substances.
Special attention I would call to all parties who have the so called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.
I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.
For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16v19-3m.

G. W. STRONG,
ASSAYER AND WORKER OF ORES,
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.

They will also receive orders and furnish Miners' and Farmers' Supplies, including machinery of all kinds, at the lowest prices. N. B.—All correspondence with us will receive prompt attention. 10v19-3m

WALTHAM WATCHES.
Let every one who wants a Watch, read this carefully
Especially if in some remote out-of-the-way place.
Now that the railroad is open, we propose to give the residents of CALIFORNIA the opportunity of getting single genuine Waltham Watches at the
Lowest New York Wholesale Prices.
We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or
REFUND THE MONEY.
As an indication of the Prices, we will quote one Watch from our list. The P. S. BARTLETT, *Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,*
$28 in Greenbacks, or about $20 in Coin,
All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,

Statement of the Giant Powder Company Regarding the Late Explosion.

EDITORS PRESS :—The Board of Trustees of the Giant Powder Company deem it due to their customers and the community at large that an official statement should be published, in connection with the explosion which took place at their works on Friday night last, November 26th.

The powder is now used so extensively throughout this coast and the demand for it is increasing so rapidly, that the facts connected with the complete destruction of the company's factory by the recent explosion should be placed before the public, in order to give them all the knowledge possible of the nature of this new and powerful explosive, so that the community may know whether or not it is really a safe article to be used.

Giant Powder is exploded with a peculiar percussion cap attached to an ordinary piece of fuse; the Company furnish these caps, and up to the 1st day of November, 1869, had sold over half a million of them. This number of caps represent about 500,000 different explosions or blasts. The powder with which these blasts have been made has been manufactured at the works of the Company, and has been handled and transported in every possible manner, on steamers, sailing vessels, railroads, stage coaches, express wagons, freight wagons and pack animals, and has, of course, been subject to all the risks attending such varied transportation and use. As the powder was a new and untried article, it followed that every person handling or using it commenced with entire ignorance of its nature, and of course the article was liable to meet with all possible accidents; yet up to the present time (although blasts have been fired from ¼ ounce up to 1,200 pounds at a time), but three accidents have occurred, all of which were explosions produced by the percussion cap in the ordinary way. In one case the instantaneous burning of a defective fuse caused the blast to explode before the person injured could get away from it. The other two accidents were caused by striking a pick into holes loaded with powder and cap, and thus exploding the cap and of course the powder. Thus, it will be seen, that in handling and transporting the powder in all possible ways, and making over a half million of blasts, not a single accident has occurred from an explosion produced in any way whatever, except the usual way prescribed—with a percussion cap made expressly for that purpose.

This is certainly a very extraordinary record, and would establish the powder as being infinitely more safe than any other known explosive. It is therefore of the utmost importance that we should look into the facts connected with the late explosion at the factory in order to ascertain whether it confirms or upsets our previously formed opinions.

The Giant Powder Works were situated on the side of a hill; excavations were made in the hill, forming a series of three benches, over which the main building or factory, 60 by 25 feet, was erected, the upper floor being some 25 feet above the lower one.

Nitro-glycerine is used in making the powder. The raw materials, viz: glycerine—nitric and sulphuric acids—were taken over the road along the side of the hill to the upper floor of the factory where they were converted into nitro-glycerine, which, as soon as made, was drawn from the mixed vessel to the floor below, and from there to the next; on each floor something being done toward perfecting it until it arrived at the lower end of the building, sixty feet from where it started.

At the time of the explosion there were about 1,300 pounds of nitro-glycerine in the works, some on each of the three floors. About 75 feet from the lower floor was a cottage house, in which were sitting three men (the Superintendent, Mr. Bussenius, the Assistant Superintendent, and the teamster). One of these men, the Assistant Superintendent, alone survives, and is not seriously injured. His statement is that he saw a bright light in the upper end of the factory, as if it was on fire inside. (They had left the factory but an hour previous, when there was no sign of fire; fire was never used in the building.) On seeing the fire he gave the alarm, and all three rushed for the door, in a direction away from the factory. The survivor only succeeded in getting out of the door before the explosion took place; which explosion threw him some distance from the door, without serious injury, although he was, for a time rendered totally unconscious. The other two men were caught under the ruins of the house, which was totally demolished and the ruins set afire from a stove burning in the house.

When nitro-glycerine explodes, the result is instantaneous; no warning is given in the way of a light, and no time intervenes for any person to run away from the effect. The seeing a bright light in the factory before the explosion, and having time to run out of the cottage, is positive proof that there was fire. It is now utterly impossible to know the cause, and perhaps it may forever remain a mistery; every particle of the 1,300 pounds of nitro-glycerine on the different floors was exploded, reducing the building almost to powder.

About 65 feet from the factory, containing the nitro-glycerine, was a building in which were stored some five thousand pounds of Giant Powder; some of it was loose, in bins and tubs, some in paper-catridges, and some in boxes. This building or store room was completely demolished, the tubs filled with loose powder were blown to pieces; a heavy truck resting against the building, and close to the powder, and every spoke blown out of the wheels, and the tongue thrown hundreds of yards away, BUT NOT A POUND OF GIANT POWDER WAS EXPLODED. It was all found amongst the remains of the demolished building, and has all been boxed up since the explosion, ready to ship away to customers.

From these facts, we have the most extraordinary evidence of the safety of this non-explosive; and whatever danger there may be in manufacturing, there is certainly greater safety in handling, transporting and using Giant Powder than any other explosive known.

The works will be immediately rebuilt on a much larger scale; a new location is situated where there will be ample room to separate the buildings and take every precaution for future safety, and the Company hopes soon to be able to supply their customers as punctually as they did before the explosion and destruction of their works.

L. L. ROBINSON, EGBERT JUDSON,
HENRY BRICKWEDEL, THOMAS VARNEY,
J. N. RISDON.
Trustees of the Giant Powder Company.
San Francisco, December 2. 1869.

PAIN KILLER, after a thorough trial by innumerable living witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is, that its sales have constantly increased, and wholly upon its own merits. The effect of the Pain Killer upon the patient when taken internally, in case of Cold, Cough, Bowel Complaints, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony as an almost infallible remedy that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. dc4

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons,

Sore Throat,
Sudden Colds,
Coughs, Etc.

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

And in accordance with law, and an order of the Board of Trustees, made on the twelfth day of October, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, on Tuesday, the seventh day of December, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. D. SQUIRE, Secretary.

Office, 418 California street, San Francisco, Cal. no20

Pocahontas Gold Mining Company.—Location of Works: Mud Springs, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of November, 1869, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 419 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twentieth day of December, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twelfth day of January, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. A. JENNINGS, Secretary.

Office, 419 California street, San Francisco, Cal. no20

Taylor Mill and Mining Company.—Notice.—The Annual Meeting of the Stockholders of the Taylor Mill and Mining Company, for the purpose of electing five (5) Trustees to serve for the ensuing year, will be held at the office of the Company, No. 520 Montgomery street, San Francisco, on MONDAY, the thirteenth day of December, 1869, at four o'clock P. M.

SAM'L S. MURFEY, Secretary,

San Francisco, November 16th, 1869.

Pilot Mining Company—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of November, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room No. 7, 423 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Monday, the third day of January, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighteenth day of January, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. M. HARRON, Secretary.

Office, Room No. 7, 423 California street, San Francisco, California. no27

Silver Star Consolidated Silver Mining Company, White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of November, 1869, an assessment of fifteen (15) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of December, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third day of January, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. no13

Taylor Mill and Mining Company.—Location of Works: Georgetown District, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of November, A. D. 1869, an assessment of thirty cents per share was levied upon each and every share of the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 520 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twentieth day of December, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 17th day of January, 1870, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

A NEW EDITION

OF OVER 500

ILLUSTRATED

MECHANICAL MOVEMENTS.

JUST ISSUED BY

DEWEY & CO.,

Publishers Mining and Scientific Press

SAN FRANCISCO.

This work is superior to any other of its kind in the English language. The drawings are of good size, plain and distinct, and the descriptions full and comprehensive to intelligent readers of every class.

THIS IS A CHEAP BOOK,

Notwithstanding most Scientific and Mechanical works are costly.

No Inventor or Patentee should be without it.

It is interesting to all classes of Mechanics, Farmers, and others, who have more or less to do with constructing machinery. It is

Valuable and Handy for Every Day Use

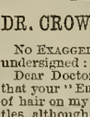
In every Mill, Factory, Foundry, Machine and Workshop. Sent to any part of the United States, for

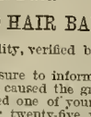
$1, POSTAGE PAID.

A liberal discount to the trade and country newsdealers. DEWEY & CO.,
Publishers and Patent Agents, Mining and Scientific Press Office, San Francisco.

WONDERFUL

Scientific Discovery.





THE GREATEST EVER MADE,

Having Baffled the Ingenuity of Chemists and Physiologists for Ages Past.

DR. CROWLY'S EMERALD HAIR BALM.

NO EXAGGERATION, but a stern reality, verified by the undersigned:

Dear Doctor:—I feel much pleasure to inform you that your "Emerald Hair Balm" has caused the growth of hair on my head—having only used one of your bottles, although I had been bald for twenty-five years. You are quite at liberty to use this intimation as you please. Yours truly, JOHN STAPLETON,
California street, San Francisco.

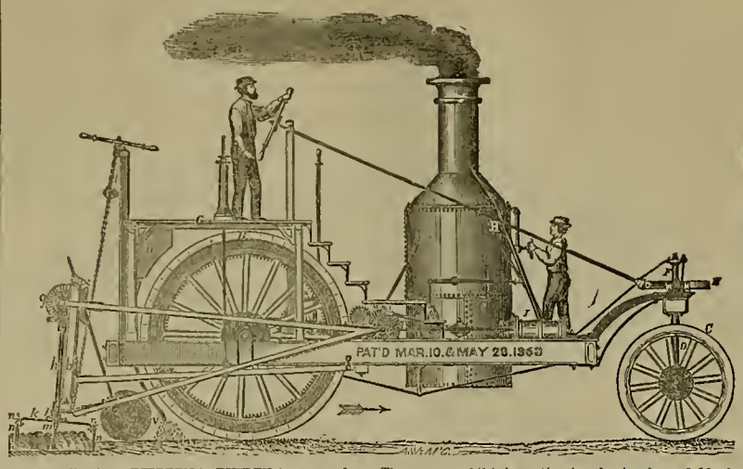
21v19-6m

The Standish Patent California Steam Plow.



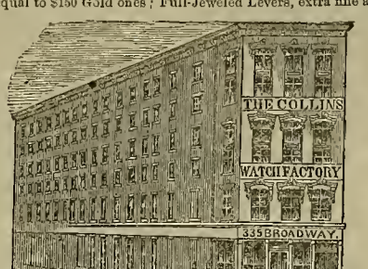
Capacity, from FIFTEEN to THIRTY Acres per day. The success of this invention for plowing large fields, is established beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of cultivating their farms, are invited to call upon the inventor, PHILANDER H. STANDISH, or address him by mail, Box 17, San Francisco. Single Machines for sale. Also, State rights, and patents for England, France, and Russia.

$10. $15. $20. $25.

THE CELEBRATED IMITATION GOLD HUNTING WATCHES,

"Collins' Metal" (Improved Oroide).

These justly celebrated Watches have been so thoroughly tested during the last four years, and their reputation for time and as imitations of Gold Watches is so well established as to require no recommendations. Prices—Horizontal Watches, $10, equal in appearance and for time to Gold Watches worth $100; Full-Jeweled Levers, $15, equal to $150 Gold ones; Full-Jeweled Levers, extra fine and superior finish, $20, equal to $200 Gold ones.



We have just commenced making a very fine American Watch, full-jeweled, patent lever, chronometer balance, adjusted to heat, cold and position, 4½ ounces down weight, equal in appearance and for time to a Gold Watch costing $250. We charge only $25 for these magnificent Watches. All our watches in hunting cases, gents' and ladies' sizes, chains, Collins Metal, $2 to $8. Also, all kinds of jewelry, equal to gold, at one-tenth the price.

CALIFORNIA DIAMONDS SET IN GOLD.

We are now making jewelry of the California Diamonds. These are real stones of great brilliancy and hardness, and cannot be distinguished from the genuine stones, even by good judges. They are particularly brilliant at night by artificial light, do not scratch or become dull by use, and retain their brilliancy for an indefinite time. The following are the prices:

Ladies' and Gents' Finger Rings, single stones, one carat weight.....$5 each.
Gents' Pins, single stone, according to the size of the stone.....$4 to $6.
Ladies' Cluster Pins.....$7 50.
Ladies' Cluster Earrings.....$7 00.

TO CLUBS.—Where six Watches are ordered at one time, we will send a seventh Watch free. Goods sent by express to be paid for on delivery.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness with the advice of a physician, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 10 cents per dozen. 25v18tf

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing. Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine, but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.,

On hand and for sale. Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.

H. J. BOOTH & CO.

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular **Boilers,** with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoas, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

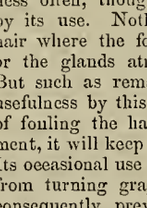
Ayer's

Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.



A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

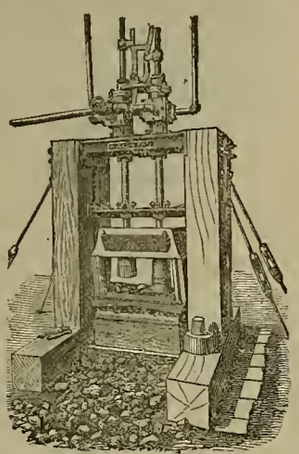
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary hands. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
Supt. W. P. S. S. M. Co., Philadelphia.

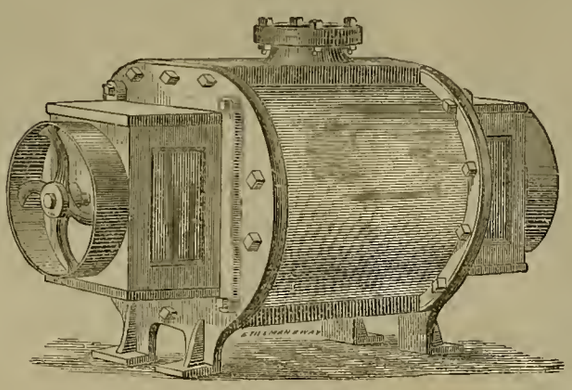
ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

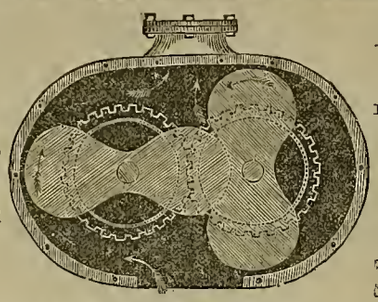
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

Blake's Patent.

THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's

Patent Steam PUMP

It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted POSITIVE under all circumstances. Send for a circular.

BERRY, & PLACE, 112 and 114 California st., San Francisco.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

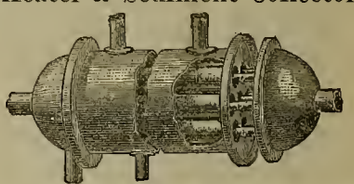
The pan being filled, the motion of the muller forces the pulp to the center, whereit is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 329 Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

BROWN'S BRONCHIAL TROCHES for Pulmonary and Asthmatic Disorders, have *proved* their efficacy by a test of many years, and have received testimonials from eminent men who have used them. Those who are suffering from Coughs, Colds, Hoarseness, Sore Throat, etc., should try "*The Troches*," a simple remedy which is in almost every case effectual.

To Advertisers.

After January 1st, 1870, the latest hour for receiving mining and other advertisements for the M. AND S. PRESS will be during Thursday evening, as our paper will be printed for the interior mails on Friday morning.

LAYRES' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office, S. F., for $1, post paid.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, have just issued a neat little volume of over five hundred well executed wood cuts of the principal Mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the M. & S. PRESS office, postpaid, for $1.—*New Age.*

Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass. CALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco. Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Addis, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

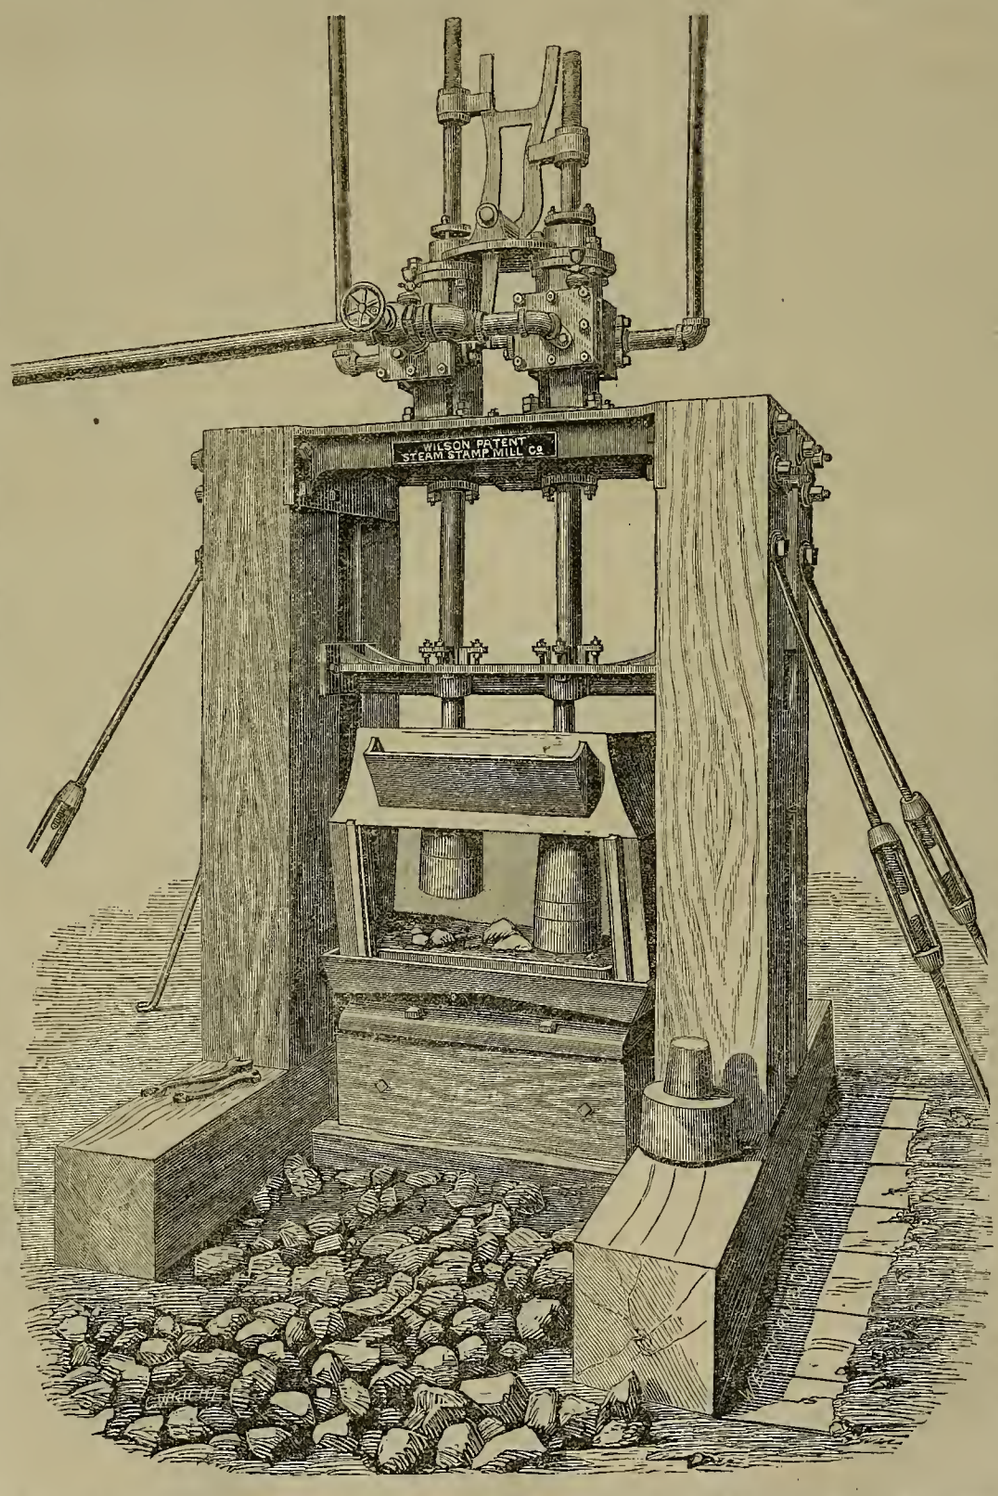
The Wilson Patent Steam Stamp Mill.

We give herewith an illustration of the Wilson Patent Steam Stamp Mill, to which allusion has already been made in our columns. This mill is of that class where the steam is applied directly to the lifting of the stamps, without any intervening machinery. Although such mills involve a greater waste of steam in proportion to the work performed than is involved in the use of stamps driven in the usual manner, it is claimed that such loss is more than made up by the avoidance of the friction due to intervening machinery and the greater rapidity and force of the blows and the economy of space attainable. In the device here shown, the valve gear is very simple, and will be readily understood by a glance at the engraving. The bed upon which the stamps work is entirely disconnected with that of the frame which supports and guides the stamps, by which means the jar of the blows is measurably kept away from the machinery—a difficulty which has heretofore been a source of much trouble in operating mills of this description.



It is claimed by the inventor that these mills have been in operation in North Carolina and elsewhere a sufficient length of time to thoroughly test their efficiency and practicability. The company place the capacity of a two-stamp mill, like the one here represented, at one ton per hour of the hardest rock. When running on softer or decomposed rock they will greatly exceed this work. The weight of one of these stamps is 500 pounds, and it is thrown down at each blow with an added force of 1,500 lbs. The greater efficiency of a quick and rapid blow over a slow one is well known to every millman who has had any experience in breaking rock upon the "dump," where a light hammer and quick blow is always employed in preference to a heavy and slow one. For supplying the mill with steam, a boiler of 15-horse power is sufficient. The fuel required for 24 hours is about two cords of wood. The stamps are intended to run and strike about 500 blows per minute (200 blows to each stamp); but a greater speed will have no effect upon nor endanger the mill by undue wear or breakage of any of its parts; and, unlike all other mills, they are seldom out of order. When the mills leave the shop for shipment, they are all complete, including braces, extra shoes and dies, etc., and weigh about 5,500 pounds, and can be set up ready to run in about three days after the foundation is laid. These mills are working successfully in the following localities: Russell mine, Montgomery county, N. C.; Cold Spring mine, Buckingham county, Va.; Balbach Smelting Works, Newark, N. J.; Bennett mine, Col.; Custom mill, Central City, Col.; Iron mine, Eastport, Me.; Vigilance mine, Nevada county, Cal.; and orders are being filled for other localities, while some are in transit to other mines.

Address F. R. Wilson, Superintendent, San Francisco, Cal., or A. Bicknell. Agent, Nevada City, Cal, See advertisement in another column.

THE GAME OF SPECULATION.—It would appear from the following, which we clip from the *Mining Record*, published at Melbourne, Australia, that California is not the only place afflicted with unprincipled speculators: "But little can be accomplished by the press to check the gambling spirit which now and again, in some error of the moon, gets the better of a large section of the people; but that little is bound to be attempted by any independent newspaper. If there be one duty of the newspaper more than another, plain and unmistakably it is this. Of course, as the press is made up of human entities, it may happen that an unworthy fragment of it may be absolutely in the hands or under the control of people whose personal interests lay in the initiation and encouragement of the speculative fever, which all actuated by an unselfish desire to assist the advancement of the Colony must condemn. When this is the case, there is nothing to be done but for the press as a body, to be more careful and persistent in the utterance of a warning note at all befitting seasons."

ILLUSTRATION OF THE NEW CAPITOL.—We shall soon publish a fine pictorial view of the State Capitol building as it will appear when completed, with an account of its progress of construction. We also expect to be able to give the plan of all the stories, with a full and correct description of all the apartments. There are many interesting facts connected with this great work which can thus be illustrated with much satisfaction to the people of the State.

Mining vs. Stock Jobbing.

[Written for the Mining and Scientific Press.]

Editors Press:—The observation of Prof. Rowlandson, recently quoted in the editorial columns of the Press, to the effect that "sometimes a mine is found to pay under the stock-jobbing system, but so seldom that it may be considered as merely a dangerous experiment," is no less pertinent than true.

The disastrous effect of stock-jobbing upon every corporate enterprise, and more especially mining, is an evil that certainly merits a greater share of attention than it has hitherto received from the press or the public. The immunity enjoyed by those engaged in this species of gambling seems to result from a self-arrogated respectability unbought of by lottery-policy and faro dealers, although it is clearly demonstrable that the evils, public and private, that result from the operations of the former, are much the greatest in degree.

Mining, as a business, necessarily involves a degree of uncertainty, unknown in the business of railway transportation, manufacturing, etc., that makes the manipulation of its shares at the stock board certainly an experiment dangerous to every well-grounded hope of success.

The proposition that the successful jobbing of the shares of a mining incorporation inevitably necessitates the mismanagement of the mine, may sound somewhat sensational to those unfamiliar with the subject, yet it is nevertheless a fact, susceptible of the clearest demonstration; and the most casual observer will find along the Comstock Lode, from Cedar Hill to American Flat, a line of costly monuments to its truth.

For the benefit of the uninitiated, let us briefly sketch the *modus operandi* usually resorted to by stock operators to give a fictitious value to the shares of a mining incorporation for the purposes of what is dignified with the name speculation. If it is necessary to hull the shares, at the highest of a ring, the mine is worked, for the time being, with the sole object of a large, continued or increased yield of bullion. Every available ton of ore is extracted in the shortest possible time, and worked in a hurried, slovenly and wasteful manner. All "dead work" essential to future economical or successful working is abandoned, and in mining parlance the "eyes of the mine are picked out." The highest attainable price being reached, those on the *inside* sell, while the non-speculative shareholders on the *outside* find themselves the proprietors of a mine that requires as great an outlay of capital, perhaps, to restore it to a condition for further working as it did to open and develop it in the first instance.

If it is necessary to bear the shares, then a large amount of needless "dead work" is done; shafts are sunk and levels are run; large bodies of rich ore may be exposed, still assessments crowd thickly upon one another, until at last the wearied shareholder, so unfortunate as to be outside the ring, either sells for a trifle himself, or is sold out under the hammer for arrears in unnecessary assessments. This latter process is identical with what is popularly known as "freezing out," and has a very frigid effect on shareholders of limited means.

By these means, mines that would otherwise be steadily dividend paying, are rendered totally worthless as a permanent investment. How we are quackingly told by the "lame ducks" that mining is a failure, in the face of the fact that Nevada, with a population not exceeding 75,000, will yield for the current year, at a reasonable estimate, bullion to the value of $18,000,000. It is certainly gratifying to know that the kind of gold and silver mining prosecuted so diligently at the stock board in San Francisco is partially a failure; and would it not be a measure of justice and prudence to make it wholly so by a little wholesome legislation, such as has been outlined and recommended for the purpose of check-mating the operations of the gold gamblers of Wall street in their efforts to disarrange money values and hamper commerce?

While the mining interest is subjected to the paralyzing influence of unscrupulous stock gambling; while a great moneyed monopoly broods like a nightmare over every industrial enterprise on the coast and maintains such rates of interest as preclude competition in any avenue of business or trade, and with a railway company that discriminates 75 per cent. against way traffic, is it not a matter of gratulation and surprise that our success in producing bullion has been as great as it has?

Once relieved, in a reasonable measure, of those influences that militate so strongly against success, especially stock jobbing and rates of railway transportation that are closely in competition with ox teams, it is no fancy figuring to say that the present bullion product of Nevada will be doubled in five years, and with railway connection for the southern portion of the State, quadrupled in ten.

Mining, however disastrous it may have been on the curbstones and at the stockboards in New York and San Francisco, in Nevada is a very gratifying success.

Mining in Placer County.

[Written for the Mining and Scientific Press.]

When at Auburn I went to see the Evening Star mine, located three miles from that place, and owned by Wm. Quick, J. B. Taylor and others. There is a shaft down sixty feet on the ledge, which they were timbering up at the time of my visit, so that I could not go into the mine. The Superintendent informed me that the ledge is from ten inches to two feet in thickness. It was discovered last spring by Mr. A. P. Lowery, who was engaged in setting sluice-boxes across it. On prospecting, he found that it was very rich, both in free gold and in sulphurets. They have taken out quite a lot of good-looking rock, a portion of which will be hauled to the Green Emigrant mill next week, a mile and a half distant, for reduction. The rock is rich from the top down.

There are numerous other ledges in this section; but they appear to be "pocket veins." Most of the placer mines in the vicinity of Auburn are worked out.

At the Green Emigrant mine I met Mr. J. F. Clouser, and J. F. Jordan, Esq., of Chicago, prospecting the mine with a view to its purchase. The trouble with this, as with other mines in the neighborhood, is the fact that, although they present large, well-defined veins at the surface, sometimes five to eight feet in thickness, they are liable to run out entirely at a depth of fifteen or twenty feet. Prospectors, however, are confident that there is a good ledge somewhere near, which they are still in hopes of finding. The Green Emigrant mill was put up in the fall of 1868. Notwithstanding the generally unfavorable character of the ledges here, they are often found to pay in spots as high as $20 to $40 to the ton.

While at Michigan Bluffs, Messrs. Erman & Co. informed me that they had derived much benefit from having the strips of wood, in the bottom of their sluice-boxes, lined with strips of iron. The placer miners in this section express the opinion that some of our inventors would do well to turn their attention to improvements in collecting placer gold. They think that quartz operations have absorbed more than their share of the attention of the inventive genius of the State. I throw out the hint for what it may be worth. M.

P. S.—In the notice last week of the Lewis' claim, the word "stocken" should have read "slacken."

The amount of copper produced in the whole world in 1866, the latest date of which we have accurate statistics, is given as 93,415 tons, or nearly double that produced in 1846.

There are at present some 550 young American students at German universities, and upward of 1,000 American youths and girls attending the higher schools and educational institutions.

The Late Nitro-Glycerine Explosion.

[Written for the Mining and Scientific Press.]

Editors Press:—The cause of the recent explosion of nitro-glycerine at the Giant Powder Works is generally regarded as shrouded in mystery. The same has been the case with similar accidents heretofore. If occurrences of this kind can not be accounted for from the facts hitherto established, respecting the conditions under which nitro-glycerine will explode, we must look for causes yet undiscovered, and in furtherance of this object I venture to submit the following hypothesis:

Nitro-glycerine is exploded by concussion, which involves compression. At the Giant Powder Works there was a "leaky tub," and part of the floor of the factory was "saturated" with the explosive compound. On occasions of former accidents with nitro-glycerine we have heard of leaky casks or cases. Wood absorbs liquids by capillary attraction, through the effect of which it swells, if there is no adequate opposing resistance to its expansion; if there is such a resistance, and consequently no room for expansion, compression must take place; and if the resistance is such as partly to yield, both expansion and compression must result, each according to the degree of resistance.

The force exerted by capillary attraction in wood is so great that in former times it was turned to use, in many instances, in which explosive agents are now employed to the same end. Thus, for the purpose of breaking blocks of stone in quarries, rows of holes were drilled in the rock, plugs of wood were driven into the holes, and water was poured upon them, which caused the wood to expand with such force as to detach blocks of stone of considerable size.

It is plain that the water absorbed by a plug of wood, under the conditions just mentioned, must itself be subjected to a pressure proportionate to the force manifested by the expansion of the wood. The same must be the case with any other liquid capable of wetting wood.

Supposing a wooden tub, provided with a tap-hole which is closed by a wooden plug, is filled with nitro-glycerine;—what must necessarily happen? The staves and bottom of the tub being cut approximately parallel to the fibre of the wood, can exercise but comparatively little capillary attraction; and as their expansion is also but slightly resisted, any nitro-glycerine absorbed by them cannot be subjected to great pressure. But with the plug in the tap-hole the case is different. The face which it presents to the nitro-glycerine being transverse to the fibre of the wood, it is in a condition to exercise capillary attraction with avidity; and as the resistance opposed to its expansion is considerable, the pressure upon the nitro-glycerine within its fibres must also be considerable. The question, then, arises: might that pressure not be sufficient to cause explosion?

Again, if nitro-glycerine is brought in contact with a portion of the end of a two or three-inch plank, and the tenacity of the wood which remains dry is such as to effectually resist its expansion, might there not also be exerted sufficient pressure to explode the penetrating liquid?

A simple way of trying whether or not there is anything in the suggestion here advanced, would be to bore a hole into a piece of iron, drive a plug of dry wood into it, pour nitro-glycerine upon the plug, and then see if, after the liquid has been sufficiently absorbed, an explosion will take place. A. F. W. Partz.

Oakland, Dec. 9, 1869.

"Card Postage."—A system of "card postage" in successful operation in Germany is about to be introduced in England. Cards of uniform size are provided at the post office, having in one corner a stamp. One side is for the communication, the other for the address. The cards are sold at one cent each. Every kind of business notes, for which privacy is not necessary, can be sent by these cards at one-half the expense of a letter and at a great saving of time.

Mining—Louis A. Garnett, Esq., and the Committee on Ways and Means.

[Written for the Mining and Scientific Press.]

Mr. Hopkins in his "Common Sense" refers to "a very able pamphlet lately addressed by Louis A. Garnett, Esq., to the Congressional Committee on Ways and Means, upon the decline in the production of the precious metals," which he quotes as follows:

"Says Mr. Garnett on page 8: 'All the discoveries of gold within the past twenty years, confirm our own experience, which is, that the maximum is reached within a few years following the discovery. Our own production did not fairly begin until 1849, yet we attained our maximum, $90,000,00, in 1852. From that sum it declined in ten years to 45,000,000.

In Australia, the discovery was made in 1851, the maximum of $61,000,000 reached in 1853, declining in ten years to $32,000,000, thus showing the same proportionate decline to our own.

No one will deny, it is presumed, that within the United States there are at least 100,000 men engaged in processes for extracting the precious metals. Now, to say nothing of the immense amount of capital invested in mining machinery, and other incidental expenses, such as the salaries of engineers, superintendents, agents, secreteries, etc., etc., but simply take the minimum day's wages of 100,000 men, and *which they could earn at any other pursuit*, to wit: $3 a day for 300 days, we have $90,000,000 as the cost of labor alone to produce $50,000,000. It would be entirely safe, therefore, to say that every dollar produced from the mines costs two dollars to produce it."

In regard to the number actually employed in the production of the precious metals, we believe there are no statistics. Mr. Garnett's estimate may be above or below the fact. We think that Mr. Garnett's estimate of time employed, viz.: 300 out of 365 days, erroneous, as we do that men now employed in the mines could, in any other pursuit, earn $3 a day, or $900 a year. Could they, we believe labor in the mines would soon become very scarce.

We venture to ask Mr. Garnett what he thinks would be the value of labor in any branch of industry in California six months after the mines ceased to produce gold, and what would be the value per front foot of any property upon Montgomery and California street.

Had Mr. Garnett pursued his researches into the statistics of Australia, subsequent to 1863, we think he would have paused before he included that country in his deductions. He would have discovered that the minimum of decline in the province of Victoria, to which his statistics refer, was reached in 1862, followed by a steady increase, which in 1868 showed a gain of upward of 50 per cent. over the product of 1862, with a fair prospect that the yield of 1869 will exceed that of 1868.

Mr. Hopkins submitted his views as to the resources of California to the people of the State for their approval or disapproval, and courted criticism;—while Mr. Garnett, who apparently entertains views similar to those of Mr. Hopkins, addressed himself to Congress, through their Committee on Ways and Means. C. M.

Torpedoes—Lieutenant Lupis, of the Austrian navy, has hit upon a way of making the torpedo go straight at the enemy's ship, and explode by striking it. He constructs his torpedo in the shape of a dolphin, fourteen feet long, and sixteen inches thick with vertical and horizontal fins of metal. Into the head of this infernal animal he stuffs sixty pounds of compressed gun-cotton, with a number of iron plugs, like the bolt of the pin-catridge, sticking out. The belly is filled with air compressed to thirty-five atmospheres, and this motive power works a screw which projects under water at the tail, giving a speed through the first four thousand feet in the water of not less than eight or nine miles an hour. The lieutenant launches his creation from a long tube, which enables him to give it a definite direction toward the ship, and if it merely impinges upon that mark, some one of the pins or bolts is sure to be driven into the charge. In that case, the vessel would disappear with all hands.

Mechanical Progress.

Drawing Steel Tubes.

In a recent lecture before the Society of Arts, Mr. John Anderson, C. E.,—a portion of whose lecture upon the flowing property of solid metals under pressure we have given in a previous issue,—describes the manner of drawing steel tubes of any length or size or shape. We quote:

"To accomplish this operation, a hole or slit, according to the section required, is first formed in a short thick mass of steel; two dies are employed, the one internally, which remains in use throughout the operation, the other externally, which has to be exchanged for a smaller one at every passage. Then enormous hydraulic pressure is brought to bear in pulling it through the vacant space between the internal and external dies, thus leaving a portion of the steel behind, which forms a reservoir of steel for the increased length, by future elongation with that which could not pass through at the rate of motion of the apparatus, but to follow suit as it has opportunity, and then, by annealing the mass of steel, and using smaller and smaller external dies in succession, the thick lump becomes gradually elongated into any length of any section.

With the object of carrying out such a manufacture, a company was recently formed in London, to produce steel tubular forms of any size or section. A variety of remarkable specimens was produced by them which made every engineer's mouth water, and although commercially it has not succeeded, simply because the arrangements of the world were not quite ripe for it, still that, judging by all past experience, does not affect the question any more than the receding wave affects the rising tide. The grand fact remains that it is a possibility, by sufficient pressure and patience, to cause solid steel to flow into any hollow form of section without breaking its continuity; it is a wonderful triumph of mind over matter which cannot be ignored, and which has yet to accomplish most important results in the future history of applied mechanics."

Another New Brake.—Wilkin & Clark's brake just introduced on the Midland Railway, is illustrated by the *Engineer*. We quote part of the description given:

"The principle of the brake differs from others in so far as the guard has to keep it from working till he requires the brake, when he slackens the operating chain, and the brake is then allowed to act of itself; and one important point of this self-acting arrangement is that so long as the train is coupled together, and the guard with it, he can keep it out of gear; but if by accident the train breaks away on an incline, it becomes self applied. This point was tested before the train was put on the passenger service. The driver was ordered to run down a gradient of one in ninety, and after attaining a speed of thirty miles per hour the train was parted from the engine as if by accident, and the train came to rest on the bank in 200 yards, or fifteen seconds of time. Another train stopped in 330 yards, or twenty-seven seconds. As a further test, the driver was ordered to get up full speed and keep on full steam; the brake was applied, and, without shutting off steam, the train was stopped in 1220 yards."

Increased Strength of Wire-Drawn Iron.—The strength of iron or steel is greatly increased by the wire-drawing process. "In the case of iron of an ultimate strength of twenty-five tons per inch, it is increased in strength fully ten tons, and some of the best iron, with a strength of twenty-eight tons, is raised to forty tons. The most remarkable change in this respect is in the case of steel music-wire. The mild steel out of which this is made has a strength, when in the natural state, of from thirty to forty tons, according to its steeliness, but when tempered mildly, by being made red-hot and then cooled in oil, and elongated into wire, its strength is increased fully three-fold. At the same time, if such steel or even iron wire is made red-hot, so as to allow the natural law to assert itself, all these high conditions vanish."—*Cantor Lectures.*

An Eight-Ton Steam Hammer.—The Landore Steel Works have erected a single acting steam hammer, the head of which weighs eight tons. The cylinder is thirty inches in diameter. The anvil-block, which is cast in one solid piece, weighs seventy-five tons.

Reversible Rolling Mill Engines.—*Engineering* of October 29th describes and illustrates some new engines just set in operation at the Landore Works, Swansea. They drive a large rail mill with rolls 24 inches in diameter, and 6¼ feet long. We quote: "To obtain a reverse movement it has hitherto been the custom to adopt clutches and gearing, which are generally of a very massive character, to resist the sudden strains so frequently thrown upon them by reversing the mill, whilst in such cases a ponderous fly wheel is a necessity. In engines like those at Landore, the engines themselves are made to reverse, and with them the rolls, the boiler being the reservoir for power; and it is no uncommon thing to obtain a reversal in every second of time, or sixty reversals per minute, the movements of the engine being perfectly easy the while. The fly wheel (and the gearing to a great extent) is dispensed with on this principle, thus rendering less massive foundation necessary, and occupying much less space than ordinary rolling mill engines. In the engines we illustrate the starting and reversing handles are conveniently arranged to enable the engine man to watch the operations in the mill and regulate the engines accordingly. The steam can be cut off either inside or outside of the engine shed; and the moving parts being all well balanced, the engines are under the perfect command of the man in attendance. With these engines and mill ten steel rails have been rolled down from square ingots in sixteen minutes, which is considerably quicker work than can be accomplished by any other arrangement of engine and mill."

Bursting Pressure of Boilers.—"In casting up the bursting pressure of boilers, it is necessary that some number representing the tenacity of plates one-inch thick be decided upon. Some engineers estimate it at 34,000 lbs., while others place it as low as 25,000. These figures suppose the iron to be of the best quality. By an inch of sectional area is understood a sufficient surface of boiler-plate of any thickness under one inch, to make a thickness of one inch. In other words, suppose a boiler to be constructed of ½-inch iron, and from its end we cut off a section or hoop one inch long, two such sections would be equivalent in quantity of iron to one hoop one inch thick. In testing the strength of iron, bars one inch square are used; in estimating pressure on boiler-plates, sufficient surfaces must be taken for each thickness to equal in quantity a bar of iron one-inch square. If we assume that single-riveted boilers will sustain a strain of 34,000 lbs. per square inch of section the strain on each superficial inch on a plate ⅝-inch thick would be ⅝ of 34,000.—*The Locomotive.*

Filing Rip Saws.—A correspondent of the *Scientific American* writes: "I always file my rip saws from point to handle. I claim that in so doing the teeth can be kept at a uniform length. I file all from one side, and square across, and I raise the handle of the file a trifle above the point. I have found that if I held the file horizontal I would get the edges of the teeth nearest to me a trifle lower than those on the opposite side, and the result would be the saw would run crooked. Then I file the teeth six or eight inches at the point at a much less angle than I do the rest of the saw, and give them about the same pitch that I do a crosscut saw; the object is to facilitate sawing through knots. All new saws (back saws excepted) will be found high in the middle, and I keep mine in that shape, say one-fourth inch swell in a 26-inch saw. It is almost impossible for any one to maintain a parallel stroke forward and back; the hand will naturally fall a little in pushing a saw forward, and rise in drawing it back, so a saw that is full in the center will counter-balance that rocking motion of the hand."

Varnishing.—The *Hub* says the varnish-room should be the "parlor" of the shop. Too often the room which is good for nothing else is the one selected. Some old fogies think the back-yard will do well enough. A model varnish-room is well lighted, well ventilated, evenly warmed, and perfectly free from dust. The walls should be smooth, and offer nothing upon which dust can lodge. The room should be perfectly empty; and two or three hours before it is used, it should be carefully swept and sprinkled. Some varnishers have a silk suit to put on before entering the room; thereby avoiding the dust which their ordinary clothes are sure to carry.

Scientific Progress.

Harmonics in Optics as Well as in Acoustics.

Professor H. Wurtz gives an interesting notice of some new speculations upon the nature of Light, which, if supported by future experiment, will open up a new world to the scientist. We have space for only a part of the notice, and that condensed. Premising that "he who does not speculate will never discover theories, and thus neglects his duty",—because Science is made up of theories, that is to say, of successful generalizations,—he goes on to speak of a memoir read before the French Academy on the 16th of August last, by M. de Boisbaudran. Earlier in the same month, M. Mascart,—who "had shown, in 1863, the six principal rays of sodium to be all double, with the two component bands in each case at the same distance from each other",—announced that he had now found that the magnesium group of three green bands coinciding with the solar ray *b* are *twice repeated* in the ultra-violet. He concludes: "It seems difficult to believe that this reproduction of like phenomena can be the effect of chance; is it not more natural to admit that these groups of similar rays are *harmonics*, dependent upon the molecular constitution of luminous gases?

"M. de Boisbaudran asserts that his own mind has been long occupied with the very problem involved in the results of Mascart; and that he has, now filed in the Secret Archives of the Academy, a sealed packet, in which he says: "The spectral rays of the metals of the alkalies and alkaline earths, classed according to their refrangibilities, are arranged, like their chemical properties, in the order of their atomic weights." He claims to have already developed the laws which rule these harmonic repetitions of luminous rays; since, upon mechanical principles, it is obvious that the heavier molecule should possess a greater wave-length than the lighter. Chemically identical luminous molecules must oscillate isochronously, because they are known to engender constant and uniform wave-lengths in the Ether. He proceeds to explain the origin of the distinct rays evolved by each elemental molecule, which we see in the spectroscopic field. The molecule executes a system of distinct vibrations, constituting a sort of complex cycle, at the end of which it always returns exactly to the same initial phase. It is the vibrations of the same order, repeated in a succession of these cycles, that are isochronous, and *produce a spectral ray.*

"The beauty of this generalization",—says Prof. Wurtz,—"cannot fail to strike the most matter-of-fact mind. We have, in this hypothesis of de Boisbaudran, this grand comparison between the Infinite and the Infinitesimal drawn still closer, for we have the molecules endowed with orbital motions simulating those of the celestial bodies, and subject therein to similar and immutable laws. The grandeur of the thought is overpowering."

Prof. W. asks in conclusion, "whether the developments of the spectroscope, especially in view of this new hypothesis of the relations of light, molecular motion and the ether, will not necessitate a complete revision, if not reconstruction, of our accepted theories of the *polarization* of light and heat?"

A New Pyrometer.—M. Lamy has presented to the French Academy an ingenious pyrometer, founded on the constancy of the temperatures accompanying the phenomena of dissociation. It consists of a porcelain tube, glazed on both sides, closed at one end, and connected at the other with any convenient manometer to measure the tension developed. In this tube is placed a certain quantity of Iceland spar or white marble in powder, and it is then filled with carbonic gas by raising it to a bright red heat. When allowed to cool, the carbonic gas is entirely re-absorbed by the lime, and the manometer indicates a complete vacuum in the tube. The apparatus is therefore a true barometer, the depression of the column, if mercury be used, taking place only at high temperatures, and thus measuring the tension. To make this instrument of practical value, it is necessary that the temperatures corresponding to the maximum tensions of carbonic gas should be determined and tabulated. Such tables M. Lamy is now occupied in preparing. This instrument may be introduced into a furnace, and gives all temperatures above 800° by a simple reading, like an ordinary thermometer. Its indications are more marked the greater the temperature; while those of an air pyrometer grow feeble under the same circumstances.

Uranium in Photography.—We give, for the benefit of photographers, the following from H. C. Bolton, in *Silliman's Journal:* "According to my experience, after the nitrate, the ammonio-citrate of uranium is the most sensitive salt. This double salt was prepared by neutralizing a given weight of citric acid with oxide of uranium and an equal portion of the acid with ammonia, mixing the solutions and evaporating. The golden yellow solution showing no tendency to crystallize, it was evaporated to dryness and gave a semi-vitreous mass somewhat resembling citrate of iron. The uranium in a solution of this salt is not precipitated by many reagents; an excess of ammonia is without effect, ferricyanid of potassium and sulphid of ammonium only darken the liquid, the presence of citric acid preventing their action as in the case of iron, manganese and aluminium. On boiling with caustic potash the solution is decomposed with precipitation of uranate of potash. The salt is insoluble in alcohol which throws it down from an aqueous solution. This ammonio-citrate is the only compound of uranium which I have observed to be sensitive to sunlight in the dry state."

Chemical Affinity the Parallel of Gravitation.—Dr. Van der Weyde answers the rejoinder of Prof. Walling in the *Chemical Repertory.* We have not space except for this extract: "Chemical affinity in regard to the atoms of matter is the same as gravitation in regard to the members of our planetary system; chemical decomposition, or destruction of cohesion, which increases the distance of the atoms or molecules, is in regard to them the same as is the lifting up of a weight, or in general the counteraction of gravitation, is in regard to our earth; and each requires force to accomplish it. In the case of the decomposition of a chemical compound, which is the overcoming of the affinity of its atoms, a force must be employed equivalent to the heat produced during the combustion; we all know how great is the heat produced by the combination of hydrogen and oxygen, and how strong the equivalent electric current has to be, to decompose the resulting water again into its original elements; in which then the force employed is stored up again. The same law is prevalent when destroying cohesion, or when raising a weight."

Superficial Tension of Liquids.—M. Plateau considers that the singular movements of particles of camphor upon the surface of water result from the fact that ths water is charged with camphor in the parts adjoining the floating mass, thus diminishing the tension, but in quantities which vary in the different azimuths. The particles of water the farthest off then pull in all directions, by virtue of their excess of tension. To prevent the tension of water diminished in contact with camphor, the author agitated water with fragments of this substance, and measured the tension of the liquid, and found that it lowered itself from a tension of 7.3 pure water to 4.5. He discards the theory of a reaction on the part of the liquid itself, by the simple remark that camphor, as has been noticed, does not make such a movement on oil, notwithstanding that it dissolves itself in it. This absence of movement is perfectly in accord with the theory he advances, since the tension of oil is but 3.5

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

The Price of Wheat.

The times are hard. Money is scarce, mining is dull, and the price of wheat has fallen to a very low figure—but a trifle above the cost of production, in this land of dear labor and still dearer transportation. Yet butter is high, and so is beef and pork, and many other things produced upon the farm. Why cannot our farmers take the hint, and diversify their labors more? Farmers in California ought not to complain of hard times, so long as our people are getting their butter, cheese, eggs, etc., from Chicago. But we started in to note the price of wheat.

Various circumstances have conspired to bring about the present low price of this commodity; but the realization of large crops is not one of them. If it was, that circumstance itself would afford some consolation. The fact is, however, that the American crop east of the Rocky Mountains is not a good one; and more than that, millions of bushels have been more or less damaged in the field or stack—much of it so badly that it will have to be converted into pork, butter or beef, or somebody will have to eat very poor flour. Our California crop is something in excess; but that excess is but as a drop in the bucket. The European crop is barely an average one.

One of the chief causes of the late decline is due to the fact that holders, both here and at the East, were unwilling to sell when fair prices ruled; and now that hard times and panics are upon us, everybody is anxious to sell; and many *must*, at any price which offers. But the hard times have brought with them another trouble; their extended and depressing influence has greatly reduced the consumption of the necessaries of life—chief among which is flour. This fact is more or less patent everywhere, but especially so in Europe. The producers have had the upper hand for a few years, and now comes the turn of the consumers. The former have held on until they can hold no longer; and now their compulsory sales have broken down prices.

Will low prices continue? We think not, for any considerable length of time. Wheat in Liverpool probably touched the lowest figure two weeks ago, when it was quoted at 9s. 6d. It has since advanced 4d. It can scarcely fall back again, for the supply is not large, and there is no source from which it is likely to be increased. The present price is discouraging to growers, both here and in the Mississippi States. If it should have the effect of turning the attention of California farmers to producing at home the eggs, butter, cheese, etc., which we are now receiving from Chicago, this depreciation will not have been without its benefit.

It should also teach us another lesson. It costs no more to plow, seed and harrow for 50 bushels to the acre than 25. Hence, if we can pay expenses at present prices, with 25 bushels, would it not be well to so improve our culture, at a trifling extra cost, as to reap the larger crop? Examples of different results, due to different plowing, etc., are not wanting even in the wheat districts of California, any more than they are at the East. Why not, then, endeavor to counteract low prices, and possibly unfavorable seasons, by better culture?

Bleaching Bran.—It is said that a German chemist has discovered a method by which bran may be bleached entirely white, so that it may be cooked with the flour, so as to add to the nutritive power of bread without effecting its color.

Grain.—We see it stated that the warehouses at the new landings above Sacramento are full of grain. Farmers are still holding out for higher prices.

Cultivation of Fruit—Important Hints.

We last week alluded to the complaint that is being heard in some quarters, of a deterioration in the production and quantity of fruit, and suggested that such results were due, in a great measure, to a lack of attention to the preparation of the soil. Fields, covered with fruit trees, where the fruit is removed therefrom, rapidly deteriorate in their productive energies. In many cases even a large portion of the leaves are lost by being suffered to blow into the roadways or adjoining open fields, so that next to nothing is returned to the soil. No land can long stand such a steady drain. The elements thus taken from the soil must be returned in the form of dressing of some kind, or the trees will deteriorate.

It has been suggested by persons who have paid much attention to such matters that the bearing principle in many of the older varieties has been injured *by budding from young trees*. At all events, many of the old favorites in the Eastern and Middle States, especially, have certainly deteriorated, in that respect, within the last twenty or thirty years, even where the ground has not been neglected. The Early York and the Crawford are especially mentioned in this connection as varieties which were excellent bearers, but are so no longer. Many other old varieties, in New York and New Jersey, although standing in favored localities, and carefully cultivated, refuse to bear as full crops as formerly.

One trouble suggested has been the fact that sufficient care has not been taken in the selection of the trees and buds. In many localities, in the States named, it has latterly been the custom to preserve seeds for stocks, from trees of more Southern growth. Such practice is condemned. It is found that Southern trees, and stocks grown from Southern pits, will not stand the Northern winters as well as trees grown from Northern pits.

It has been noticed in many instances that trees twenty and thirty years old bear full crops, while the same varieties of younger trees, though full grown and equally well protected and cared for, are very poor bearers. The reverse should be looked for; and the fact, if it exists, affords very good evidence that there is a deterioration from some cause or other. It is often noticed that orchards do well every other year, and poorly on alternate years. In such cases, careful draining and good culture would probably remedy the evil.

These hints, though coming from a distant section of the country, are not without a value here. We have never yet seen a sufficient reason given for the apparent early decay of peach trees in this State. It is generally attributed to excessive bearing, which, it is suggested, should be checked by stripping the tree of a portion of its fruit while small. We incline to the belief that a more free introduction of barn-yard compost to the soil of our peach orchards would be a better remedy.

The advantages of careful or high culture are forcibly demonstrated in the experiment with cotton, alluded to in our last issue, also in the experiments in wheat culture, in another column of the present issue. A hardy tree is an important matter with the fruit grower; and as much pains should be taken in securing such advantage as in the selection of variety. Too little attention is paid in the mountains to "shortening," to make the tree stouter and less liable to break down with snow; by which many trees are annually destroyed or greatly injured. "Shortening" might also be of some advantage in the valleys as a protection against high winds; although it neither makes the tree hardier, or causes its fruit to ripen earlier, as many suppose.

Selecting Cattle.—A farmer in selecting cattle, should be sure to choose those who have a well-formed head, with a full mild eye.

The Value of Trees.

Now that the planting season has arrived, this subject is justly attracting attention. Several points have been commented on by the papers of late, in the hope of inducing farmers to pay more attention to sylviculture, but the subject is by no means exhausted. One of the best, as well as most interesting, books in the English language on this topic (and others) is "Man and Nature," by G. P. Marsh, Minister to Italy, from which we cull freely, and which we recommend to our readers. On the value of forests for lumber, etc., we need not speak. Trees are generally supposed to have some

Influence on the Temperature.

As conductors of heat they tend to equalize the temperature of the earth and the air by conveying warmth through their roots into the earth when the air is the warmer, and into the air through their leaves when the earth is the warmer. Trees maintain at all seasons a mean temperature, and hence the air in contact with forests is cooler in summer and warmer in winter than when not subjected to this influence. The amount of influence, however, exerted from these and similar causes, is not definitely known, although there is reason to think that it is greater than is commonly supposed. Forests shelter ground to the leeward from winds. It is thought in Italy that the clearing of the Apennines has changed greatly the climate of the valley of the Po, by exposing it to the sirocco, which was formerly kept off by the forests. The felling of the woods on the Atlantic side of Jutland, has exposed the land to the sharp sea-winds and to the drifting sands. It is asserted that the local retardation of spring in Italy, France and Switzerland, is to be traced to the same cause. Observations tend to prove that in tropical climates the temperature of cleared land is about two degrees Fah. above that of the forest.

It is well known that the great swamps of Virginia and of the Carolinas are healthy, even to the white man, so long as the forests remain, but become very unhealthy when the woods are felled. In Italy the effect of the trees in depriving air of the miasma, with which it may be charged, is very commonly admitted.

The forest tends to diminish the moisture of the air by preventing the sun's rays from reaching the ground and evaporating the water which falls on the surface, and by absorption of moisture through its leaves. On the other hand, it tends to increase the humidity of the air by drawing up water through its roots and exhaling it through the foliage. The spongy mantle of leaves it spreads on the earth acts in both directions. It sucks up moisture from the air on the one hand, while on the other it retains the water—not wholly protected from evaporation—which would otherwise sink into the earth or run off in superficial channels. The result of both seems to be that trees serve as equalizers of temperature and humidity.

Increase of Rain.

It can scarcely be doubted that forests promote the frequency of showers, and if they do not augment the amount of precipitation, they equalize its distribution through the different seasons. The terrible droughts which desolate the Cape Verd Islands, must be traced to the destruction of the forests; and many are the witnesses who testify that in Egypt rain has become more frequent since the vigorous cultivation of trees. In France, observations would show that the felling of trees has caused droughts, while in the same district the replanting of trees has resulted in increase of rains. It may be remarked here that, as the atmosphere does not necessarily return its humidity to the local source whence it derives it, it is often very difficult or impossible to trace this source. Hence also, for example, if it is shown that in a certain place once freed from forests no more rain than formerly has fallen since the woods have again existed, this does not prove that these woods do not augment the amount of precipitation elsewhere.

Influence on Springs, Torrents, Etc.

It is well established that the protection afforded by the forest against the escape of moisture from the soil, insures the permanency of springs, while its removal leads to the disappearance of them. Of the many examples of this, one must suffice here. The Wolf spring, in the Commune of Souhey, France, formerly "did not exist. Eighty years ago a grove of trees grew up and a fine spring appeared, which furnished an abundance of fine water in the longest droughts. A few years ago the grove was felled, and the spring disappeared."

It has already been remarked that the forest retains water, and by absorption into the vegetable mold prevents its running off in temporary channels. Thus in spring the sudden melting of the snows and the resulting rising of the rivers are greatly modified, and the forming of torrents, which sweep along with devastating force, prevented. The cutting down of trees has caused the loss of 61,000 acres of arable land, in ten years, in one department in France, by washing away or covering with rocks and stones some of the best farms. This destruction of land has led to a depopulation of provinces to a great extent. Moreover, in this way river channels are obstructed and harbors choked up. It may safely be assumed that annually 220,000,000 cubic yards of solid matter are abstracted from the Italian Alps and the Apennines by the force of running water. Moreover, the felling of forests lead to the falling of rocks and avalanches in such countries as Switzerland, and to mountain slides. A land-slip occurred in 1618, in the valley of the Maira, which covered the town of Plurs, and spared not a soul of the 2,430 inhabitants.

General Consequences of the Destruction of the Forest.

The soil no longer protected by the trees is alternately parched by the summer sun and seared by the rigors of winter, dried, pulverized and tossed about by the wind. The melted snow and the rains no longer absorbed by a loose, bibulous mold, rush over the surface instead of sinking into the ground and storing up moisture for the springs. The rivulets are dried up in summer, and swollen to torrents in spring and autumn. There is a continual degradation of the uplands, and a continual change in river channels and harbors. The earth once fruitful, stripped of its rich mold, becomes gradually altogether barren. This is no fancy picture, and almost every narration of travel in countries which were the earliest seats of civilization, bear witness to the truth of these general statements.

Bad Effect from Overloading Trees.

A British pomologist (Dr. Lindley) writes thus: "The bending of branches of trees by an over-crop of fruit is most injurious; for the pores of the woody stock are strained on one side of the bend and compressed on the other; hence the vessels through which the requisite nourishment flows being partially closed, the growth of the fruit is retarded in proportion to the straining and compression of the stalk. Does not this account for the diminished health and vigor of trees which have been allowed to over-bear?"

Home-made Tar.—Mr. N. J. Shephord, Lebanon, Ill., says: "Procure some good fat pine, and cut in small pieces; fill a large kettle that will hold at least 15 gallons. Turn the kettle bottom upwards on a large stone, place sods around it, leaving a small place for the tar to run out, and put a dish under to catch it. Then build a fire on top of the kettle to try out the tar, and if the wood is good you will have at least from four to six quarts."

Moss on Fruit Trees—A Remedy.

Many of our farmers are beginning to be seriously troubled with the growth of moss upon their fruit trees. It usually commences when the tree is about five years old, and increases in quantity from year to year, gradually eating away the life of the tree, and seriously injuring its productive capacity. This growth takes place during the summer season, and chiefly upon the windward or northwestly side. It is usually first seen upon the trunk, near the ground, and gradually ascends, enveloping in its progress all the main or older branches. Its early appearance is often mistaken for insects. It is more or less vigorous and rapid in its growth, according as the locality is subjected to greater or less moisture, from winds or fogs.

Mr. L. A. Gould, of Santa Clara, informs us that he has found an effectual preventive in the use of sulphate of coppor or "bluestone." Dissolve the bluestone as is done in preparing it for wheat, and wash the trunk and branches thoroughly, as soon as the moss begins to appear. A single application is good for three or four years. Mr. Gould first applied it to about a thousand trees four years ago, and the moss is just now beginning to make its reappearance. The solution works no injury to the tree, and besides its utility in killing and keeping away the moss, is also an advantage in destroying any insects, or their eggs or larvæ, which may exist on the bark at the time of its application.

Grape Pruning.

A correspondent of the San José *Mercury* furnishes the following views upon grape pruning: "From over twenty years of practical experience, divided between France, Maderia, Australia, seven years in California, and six years of the time cultivating the grape vine under glass in England, I am led to believe in fall pruning. The time for pruning has been the subject of much controversy. I believe the best time is after the vines have completed their season's growth; the worst time, the spring. fall pruning enables the wounds to heal, which is very beneficial. Spring pruning often leads to decay and ill health, sometimes death. Hoping this brief communication upon a subject fraught with so much importance to our farmers and vintners may be the means of eliciting further information, I remain, etc."

Upon which the editor of the *Mercury* remarks: "There can be no doubt but the fall is the best time to prune the grape. The work should be done as soon after the leaves fall as possible. When done in the spring, the vines, not having time to close the pores caused by amputation of the limbs, before active growth commences, bleed profusely, and thereby lose much of their strength. This evil is greatly obviated by pruning in the fall, or immediately after the wood has become thoroughly ripe and hard. In addition to this, the remaining buds are better developed and more completely matured, by having all branches not required for the future years' crop removed as early as possible after the vines have completed their season's growth."

THE PEANUT CROP at the East has been unusually large. It is estimated that over a million bushels have been raised, the past season, on the south side of James river, between Petersburg and Norfolk, worth an average of $2.75 (currency), or an aggregate of $2,750,000. This seems an immense sum for so trifling a thing within so circumscribed a region. The crop in this State is constantly increasing. It is stated that over 17 tons, or about 1,500 bushels, have been shipped the past season from the Oroville depot—mostly grown in that immediate vicinity by Chinese. Who eats all the peanuts?

A PEANUT picker is among the late labor-saving machines recently introduced into the Southern States. It requires 10 hours a day for two months to gather a crop of 1,000 baskets of peanuts, at a cost of about 15 cents per bushel. It is claimed that the "picker" works an important saving in this particular.

Timber on the Public Lands.

Mr. J. N. Smith, Government Land Agent, is now in Nevada county looking after the Government's interest in the public lands. The Nevada *Gazette* says this agent claims, by way of "stumpage," one-sixth of the value of all the timber taken from the public lands, and not used in fencing or for legitimate agricultural purposes. This claim is founded upon an old law, of 1833, which was made to meet the necessities of the "Great West" at that time, and was intended to protect legitimate agricultural settlers against the plunderers who then sought to steal the timber from Government lands for merely speculative purposes. It is only by a forced construction that the law can be made applicable to the "situation" on the Pacific Coast. Mining is the chief business among the timber lands of the Sierras; agriculture but incidental. The Government has recognized this fact in various ways, and especially by refusing, until lately, to place those lands in the market. The timber has been employed almost exclusively for the needs of mining. Had Government taxed the miner one-sixth of all the timber he used for fuel, for building purposes, for sluices, for use underground, etc., etc., upon the first discovery of gold, our mining regions would still have been a wilderness, California a Territory, and "Dixie" an independent nation. It is time there was a truce to this trumpiug up of old, dead-letter laws, and even of straining more recent laws so as to meet unexpected cases, as is often done by our Internal Revenue Collectors. There ought to be more liberality and common sense shown by the heads of departments, in the instructions given to their subordinates. Such things are but little better than the land swindles attempted by the land speculators, who go about in the State, seeking for technicalities on which to found claims, and relying on the weight of their purses to worry out the more impecunious and innocent land holders who have honestly paid the price of their lands. The *Gazette* is informed by the agent, Smith, that in other localities, parties who have refused or failed to pay the "stumpage" demanded, have been arrested and imprisoned until they settled in full. If such outrages have been perpetrated in other places, in the name of law, we trust with the *Gazette*, that immediate steps will be taken by the citizens of Nevada county to place the matter before Congress, which body will undoubtedly grant relief from any such precaution in future. This new-born zeal of the officers to enforce an obsolete law may have arisen from the dullness of business at the Land Office. Our Land Laws need overhauling and revision, so as to fit them to the present condition and wants of the people.

MILKING MACHINES.—The editor of the *American Agriculturist* says there has not yet been any mechanical contrivance invented for milking which can be used long and with safety to the cows. Some of the machines apparently work well for a while; but it is found that their continued use dries up the flow of milk, and is injurious to the teat. There is as yet nothing like the human hand, and a female hand at that, which is always managed with a combination of force, gentleness and patience, far superior to the hand of man. The act of milking by hand is greater than by some of the machines; but the saving made by the latter is more than counterhallanced by the drawbacks alluded to.

NEW AND OLD HAY.—It has been ascertained that well cured hay weighed in the field July 20th, and well stored in the barn until February 20th, had lost 27½ per cent. of its weight, It is, therefore, better to sell hay in the field at $15 a ton than from the barn at $20 in midwinter.

Interesting Experiments in Wheat Culture.

Mr. R. A. Gilpin, of Westown, Pa., has furnished the Pittsburg *Chronicle* with the result of an interesting experiment in wheat culture, which he made last season, the substance of which we append: The ground measured an acre, within a fraction, and was a portion of a field of uniform character. It was prepared for seeding, and manured the same as the balance of the field. The seed was *drilled* in upon the experimental ground at the rate of three pecks to the acre, on the 25th of September, 1868; in drilling, every other pipe of the drill was stopped, so that the rows of wheat were twenty inches apart, or about double the usual distance. The seed upon the balance of the field was drilled, with all the pipes open, and allowed to mature as usual, without any after cultivation. In the spring, when the ground had become sufficiently dry to work, a small garden hoe barrow was run between the rows of the experimental acre, working the ground to the depth of about three inches. This was done only once. The effect of this working was very apparent; the wheat took a rapid start and outgrew all the rest of the field. As the season advanced it grew tall and strong, and no amount of wind or rain had any effect to lay it down. When the heads formed, the greater length was apparent. It was backward in ripening, and the rest of the field was cut and hauled for a week before this was ready.

Now for the result. The experimental wheat yielded twenty-three bushels to the acre; the quality of each was about the same. Whether from defect in the seed, or the wet season, or the late planting, the whole of the wheat was injured by the rust and weevil, and this experimental part did not escape; it was affected just as the rest was. This experiment cannot be regarded as entirely satisfactory. The season was exceptional, the seed used was inferior, and the yield of the experimental part of the field was not absolutely great, but only by comparison with the rest of the crop, which was a poor one, from the effects of the rust and the weevil; but the result is, under any circumstances, sufficiently reasonable to attract the attention of farmers and induce a further trial.

THE RAINS.—Many of our oldest inhabitants have been predicting a dry winter; but the rains of the past week have pretty effectually dispelled all fears on that score. We have just about reached the ordinary period for the beginning of heavy rains, and the atmospheric appearances are now as favorable for a good season as the most enthusiastic could wish. A good soaking rain at this time would, however, be very acceptable, and would greatly benefit agricultural operations. The young crops would get thereby a friendly lift, and the land would everywhere be placed in the best possible condition for the plow. There is much planting and plowing to be done yet; probably not more than one-quarter, or at most one-third, of the wheat has yet been sown. Our own impression is, that there is no reason to be at all concerned about a sufficiency of rain for both agricultural and mining purposes.

SLABBERING HORSES.—A correspondent of the Chicago *Farmer* remarks upon the diverse theories, more or less plausible, in regard to horses slabbering as follows: Some say it is the seed of clover; some say it is some acid weed; some one thing and some another. Now, I have very good reason to believe that in fact it is none of these, but a little black, extremely acid insect, visible to the naked eye, which is some years bred by the million, and some years not. It will usually be found in the clover-heads, if at all, while it is in full bloom, or just after that time; and possibly it may sometimes breed in other grasses also. Hence a crop that has these insects in it will always slabber horses if they eat it. But if the same crop is cut before they have matured, or after they have gone out of it, it, of course, will not slabber them. The reason why this insect makes horses slabber can readily be known by any one who will once taste of them himself. I know this not so much from personal observation, as from old farmers who have often shook these insects out of their clover-heads and tasted them themselves.

PROFITABLE VINEYARDS.—The *Alta*, in an article on vineyards, says that the profits of the best ones around this city are enticing. Mr. Shaw got $420 gross per acre from his Muscat of Alexandria vines annually, on the average, and $370 net. The Meister brothers get $735 per acre gross, and $675 net from the Alexandrian Muscat; $2,400 gross, or $2,300 net from the Flame Tokay; and over $450 per acre from the Black Hamburg, Black Malvoisie, Golden Chasseles, and White Tokay, for table use. The Mission grape, the most abundant and least valuable of all, has paid more than $100 net per acre for all the vineyards that produced crops suitable for the table, near San Francisco; Frontignan Muscat vines will yield at least $500 net per acre, for wine, at the present prices; and many of the Zinfidel, Reissling, Black Malvoisie and Rhenish Muscatella pay as much.

AMERICAN TREES IN EUROPE.—While our novelty-seekers are anxiously looking eastward for rare trees and plants, the horticulturists of Europe are asking for seeds of the most common trees in our forests. Mr. Heinrich Maurer, one of the veteran pomologists of Germany, has requested the publishers of the *Hearth and Home* to send him nuts of all the different species of hickory, oak, and other nut-bearing trees, which will be done as soon as possible. But as Mr. Maurer is far from being a young man, he certainly cannot expect to live to see trees from these nuts grow to any considerable size, and others besides himself must enjoy the fruition of his present labors. It is pleasant, however, to know that others may reap a harvest from the seeds we sow; and no doubt our German friend takes this view of the case and he will gather and plant so long as life lasts. We wish there were more like him.

WHEN DOES A COLT BECOME A HORSE?—This question is agitating the lovers of good horse flesh. Opinions differ. Some say—and among them Robert Bonner—that a colt becomes a horse only when he is past middle age. Others say he is a colt only up to his second year. Again it is asserted that a colt becomes a horse after the fifth year, when his teeth are fully grown. When "doctors disagree," who shall presume to say which is right?

PLOWS FOR CHICAGO.—Large numbers of plows have recently been received in California via. Pacific Railroad. It is stated that about 1,000 have been thus received the past season by Messrs. Hawley & Co. of this city.

ABOUT VINEGAR.—It was an observation made by Scheele, but the fact has recently been published as a new discovery, that ordinary brown vinegar will keep bright and clear, for any length of time if heated to the boiling point for a few minutes.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Leviathan.—*Chronicle*, Nov. 27th: This mine is just now attracting more attention than any other in this county. A large body of rich black ore is in sight in the main tunnel, 380 feet from its mouth, rich in native copper. This is only 200 feet from the surface, and a lower tunnel has been started to cnt it at a depth of 470 feet. The machinery for smelting works is being placed in position, hnt the storm has retarded operations somewhst.

Tarshish.—Work is progressing finely. The lower tunnel is being pushed ahesd with energy, snd to-night will see it in 140 feet—leaving ahout 660 feet farther to run to the ore. Good ore is heing taken ont of the npper drifts.

The Mountain.—To-day sees the Monntain Co. in good trim for the winter. The supplies are in and everything safe from the storms. The tunnel has been making good headway, and the prospects of the company have never been so flsttering.

Mt. Bullion Tunnel.—This is in 1,125 feet and is supposed to be in the casing of the Rosecrans ledge—the first of the series for which it is running.

Pennsylvania.—Work will be prosecuted all winter. The ore now being taken out to bo worked next summer, is very good.

Morning Star.—*Miner*, Nov. 27th: There is a report current on the street that this mine has been sold to parties who will smelt the ores in connection with those of the Leviathan. The price paid is said to be $40,000.

AMADOR COUNTY.

Kennedy.—*Ledger*, Dec. 4th: We learn that a definite arrangement has been made between the owners and the late employés of the Kennedy mine, and that work will at once be resumed.

INYO COUNTY.

Cerro Gordo.—The Virginia *Enterprise* has seen some very rich specimens of argentiferous galena from this district. The party bringing them reports good results from the furnace already huilt, and says that many new ones are projected. The furnacee are nearly all of the primitive Mexican pattern.

NEVADA COUNTY.

Dromedary Mine.—Grass Valley *Union*, Dec. 2: Sinking is progressing satisfactorily. This week will see the shaft down 80 feet, and then ore will be taken out for milling. In the shaft the rock looks well, showing free gold.

Bowery.—Same of 3d: We were at the old Gold Hill mill yesterday to look at some rock from this mine, which was being put through the batteries. Mr. Crase, the evening hefore, had cleaned off the plates and obtained 92½ ounces of amalgam. Yesterday they were again lined with it. There are 93 loads of rock, which will be finished to-day, and from all appearances the yield will he over $100 to the load. The Bowery is on Squirrel creek, and is owned by a company of practical miners.

McClellan.—The miners are down 160 feet, and have a ledge 20 inches in thickness, which bears snlphurets heavily, hesides showing free gold.

West Eureka.—A steam engine is to be put up at the shaft, which will be nsed for pumping and hoisting.

Good Shipment.—Same of 5th: The Eureka mine, yesterday morning, sent to San Francisco, gold to the amount of $28,500.

Crescent.—*National*, 2d: A crnshing recently made from the ledge, on Kate Hayes Hill, paid $19 per ton. In the 80-foot level the ledge is 12 inches in thickness. We understand it is the intention to erect one of Wilson's steam crushers.

Grass Valley Slide.—Same of 4th: Renben Thomas is drifting and tunneling, and has an immense lot of pay gravel out ready for washing. He has a great deal of top dirt to remove, hut the gravel amply compensates for the labor. As soon as it rains the hydranlic will be started. The next claims are those of John Miner & Co. They have sunk a shaft, from which they procured excellent gravel. Their tunnel is in 40 feet. Ground easy to work. Griffith & Stone's claims adjoin on the east. Trebilcock & Co., on the west side of Grass Valley Revine, are tunneling west to prospect their ground. Their cnt and tnnnel is in about 150 feet. They have struck gravel which prospects well. Abont 250 feet of slnices have heen put in the ravine. Tihhits & Co. have run in two tunnels, and the gravel has paid well. The upper tunnel is in 80 feet.

Sale of Mining Ground.—*Gazette*, Nov. 30th: Kidd, Hinds, Tully, and the South Yuha Canal Co., have purchased the hydraulic claims of Teeple and Creamer, at Omega, including the Temple ditch, for $20,000. We understand they have consolidated this property with the Omega ditch. Parties who are acqnainted with the claims believe the owners will take out dust enough the coming season to pay, clear of expense, the purchase mouey.

New Discovery.—*Transcript*, 2d: A first rate qnartz ledge has been struck near the Yuba river. A piece of quartz was brought into town, filled with sulphurets and free gold. The person stated that the ledge was hetween 18 inches and two feet thick, and had been traced to a considerable distance.

Rumored Sale.—Same of 3d: It was reported yesterday that the Eureka mine, Grass Valley, had been sold to an English Co. for $1,500,000.

Meadow Lake.—Truckee *Tribune*, Dec. 1st: Mr. James Doling, late of Meadow Lake, and the discoverer of a process hy which it is proposed to work the ores of that district, informed us a few days since, that the report that is going the rounds is incorrect. He says that he experiences no difficulty in reducing the ores hy his process, and that if he can obtain sufficient capital he will return to that locality in the spring and engage in the reduction of ores. He says the smallest he ever obtained from a ton of rock was $8, and the highest $36; the cost of working is $8 per ton.

PLUMAS COUNTY.

Wahponsee Creek.—Quincy *National*, Nov. 27: The newly-discovered diggings are attracting considerahle attention. The whole creek has heen located, and a number of the claims are paying largely, as high as an ounce a day to the hand. It is singular that this creek should have lain so long untouched in the midst of a mining community. It was thought that it could not be worked without great expense for want of drainage.

SHASTA COUNTY.

Gold Quartz.—*Courier*, Dec. 4th: We are informed that Charles Offschneider, of Whiskytown, last week found a piece of gold quartz in his claim which weighed almost 30 pounds, and is thought to contain as much as $400 or $500 in gold.

SISKIYOU COUNTY.

Started.—Yreka *Union*, Dec. 3d: The Ætna Co., Rough & Ready, got their first water on Tuesday, and hegan work in good earnest.

Good Prospect.—John Knapp struck a vein of good pay dirt in a drift he is cutting near Klamath engine house last week. It looks like the blue gravel ford near Timbuctoo and Smartsville.

TUOLUMNE COUNTY.

Confidence.—Sonora *Democrat*, Dec. 4th: The last clean up of the mill yielded $4,000.

YUBA COUNTY.

Rattlesnake.—*Appeal*, Dec. 1st: We understand that Geo. Bourne and others have rented the Rattlesnako mine at Brown's Valley, and will put the mill in operation to-day.

Rich.—Same of 2d: The Brush Creek qnartz mill, at the Mountain House, cleaned np $27,000 a few days ago, the result of seven weeks' crushing with ten stamps. The rock averages over $40 per ton.

Large Blast.—Nevada *Gazette*, Dec. 2d: The giant powder hlast was exploded in the cement hank of the Pactolns Co. at Sucker Flat on Tuesday. A numher from Nevada went down to witness it. Two charges, each containing 250 pounds of giant powder, were placed in the hank ahout 75 feet apart, and were connected by means of wires with a battery. The holes for the charges were hored into the hank 50 feet, and were some six or eight inches in diameter When everything was ready the operator gave a turn on the battery, and the explosion took place. The bank raised a trifle, and continued to oscillate for some secouds; but one of the charges, it is helieved, did not explode. The prohahility is that the caps and priming had heen damaged, as the ground is very wet. From what could he seen, it was thought the hlast was a snccess, though the effect cannot be known until the bank is washed down.

Arizona.

Wickenburg.—Prescott *Miner*, Nov. 25th: Recent news is to the effect that the cylinder head of the Vulture Co's engine was blown out, and that, in consequence, the mill was idle. A new hesd had been sent for. This is the first time this mill has stopped over a day for several years. The little mill was also idle.

Idle.—The Big Bug mill is again idle, owing to the illness of Mr. Heslep. Work on the lodes, roads, etc., is heiug pushed.

We have heard a rumor that Jas. Cusenbary has sold his interest in the Vulture mill and mine for a considerable snm.

Agua Frio District.—The ledges in Silver Mountain are the finest looking ledges we have seen in the country. They are the Mammoth, Monterey, Snow Ball and Huff. The Mammoth crops out high above the ground for over three miles, and averages 100 feet iu thickness! At Walnut Grove, we found Genung's arastra in motion, crushing the ores of the Sutler and Blue Jay lodes, which are very rich in free gold.

Rich Ores.—The Jackson prospecting party brought home with them some of the richest-looking silver ores we have ever seen; and Cal. Jackson showed us a piece of rock from a big ledge that crosses Salt river, which was full of free gold. The silver ores hsve been sent to San Francisco for assay.

Colorado.

The Tornado.—Georgetown *Miner*, Nov. 25th: In the terrihle tempest of Nov. 18th, the Georgetown Gold Mining Co's large mill huilding, the hest frame building in the county, was swept away. Huge beams and hraces, well bolted with heavy iron holts, were twisted and broken up as if they were only pipe stems. Of the many thousands feet of lumber that covered the side and end of the huilding, not one hundred feet can be found.

Items.—We are informed that a large bonanza of rich ore has heen struck in the Sterling mine....Another large mass of silver will be shipped to-morrow from the reductiou works of the Brown Co....The Burleigh drills in the Baltimore tunnel are doing good work....George Barrett has inaugurated active operations on the Helmick tunnel. It is heing nicely timhered through the slide, and is heing driven night and day....Huepeden & Co. are ruuning their new cylinder only. The partition in the old one gave out, and they are repairing it. They are in hopes to have it running soou after the first of Decemher.

Idaho District.—A new discovery, called the "Terrific," has heen made in Virginia Cañon, by S. C. Bennett and others. The shaft is twenty feet deep, and the crevice four feet wide. The walls are well defined, and the deposit large.

Reduction Works.—The Trenton Gold and Silver Mining Co. will erect large reductiou works next spring near the Snowdrift lode. Their water power on the north fork of South Clear Creek is ample for heavy machinery.

Wilson & Cass.—The first installment of dressed ore, 30 tons, treated at the dressing works of the company, will he shipped east on Saturday.

Terrible.—A large quantity of rich first-class ore is being raised, daily, from the mine. R. C. Old, Agent of the British and Colorado Mining Burean, has made arrangements with Crow & Clark for the shipment of ore to Swansea, for treatment.

Coley Extension.—There is a shaft of considerable depth on the lode. A quantity of selected ore treated at the Georgetown Smelting Works gave a yield of $384 in silver and 33 per cent. lead per ton.

Comstock Lode.—This lode is owned by the Boston Silver Mining Association. The tunnel is in 150 feet, and strikes the vein 130 feet from the surface. There are some 900 feet of drifts, tunnels and shafts. There is a gradual and constant increase in the width of the mineral deposit from two inches to eight feet. The reduction works are on Bear Creek, in close proximity to the mine, and have an abundance of timher. There are over 500 tons of choice ore mined out, and most of it hauled to the works, and 1,000 cords of wood cut and corded up ready for use.

Montana.

Sterling.—Virginia *Times*, Nov. 29th: From Mr. Percy, of Hot Springs, we learn that the richest lode in that vicinity was discovered last week on Canadian Gulch. It is named the Ida, and a force is now at work. The ore will be worked iu the Cope mill. Professor Jackson will put a full force on the Boaz lode, which has run, from several crushings, over $100 per ton.

Connor Mill.—We learn that from 15 tons of ore from the Lowain lode, Brown's Gulch, the Connor mill has cleaned up 26 pounds of amalgam, which will retort about two-thirds of that weight. The bullion will he worth about $4 to $5 per ounce, which will make the yield something over $100 per ton. There is sufficient developed quartz in the district to employ 20 mills, instead of 3, and still the miners are going down on their veins.

Summit.—The How mill at Summit is now in operation on ore from the Nelson lode.

Diamond City.—Helena *Gazette*, Nov. 25th: Times are looking up a little. Some of the claims are paying better than during the summer.

Enterprise.—Col. Keeler and others, of Helens, have undertaken the construction of a drain ditch from Ten Mile, to strike a cross chanuel helieved to exist between Last Chsnce and Ten Mile. The drain has reached a depth of 40 feet, and is 2,000 feet in length.

Another Mill.—*New North-West*, 26th: Mr. James W. Whitlatch—the qusrtz tamer of Montana—having organized a company in New York, has hegun the erection of a 15-stamp mill, near the IXL, Unionville district, near Helena. It will crush Park ore. The mill will be completed, hy contract, in 70 days.

Another Ditch.—Another company has been organized, another route surveyed, and another ditch is being dug. The owners are Pemherton, Frederickson, Newell, Brett, Reeder and some ten others, miners on Dry Gulch and Prairie Bar. It will carry water from Race Track creek to Prairie, Antelope, Spring and Modesty gulches.

Philipsburg.—Cor. of same: It is now positively asserted that the mill will start up as early as the 20th of Dec. It is understood to have been leased for one year upon a contract to ruu on 50 feet of No. 3, east, owned hy Merrell & Ullery. The proprietors, Purvine & Co., estimate enough rock in sight to furnish 18 tons per diem. The first run of a month will he made on rock from the Mountain Queeu, taken out this season, by which time it is thought from 1,000 to 1,800 tons will he ready in advance of the mill from No. 3, Comanche extension.

Idaho.

Loon Creek.—*World*, Dec. 2d: Mr. Tassell, express messenger, arrived from Oro Grande on Tuesday. He informs us that one company, working five hands—three stripping and two shoveling in the slnices—cleaned up over $300 in five hours. R. H. Johns and F. Phillips, while prospecting the same ground, took out over $7 in one pan of dirt, one piece weighing over $4. Mr. Tassell came a portion of the way on snow-shoes, and returned this morning.

Nevada.

COPE DISTRICT.

Sale of Mining Ground.—Elko *Independent*, Dec. 1st: We learn that a salc of 827 feet in the Mountain City mine has heeu made to Mr. Davis, of San Francisco, and Mr. Meador, of Santa Cruz, at the rate of $25 per foot, amounting to $20,675, cash down.

Cope Ore.—One hundred sacks of ore from the Borealis miue, and 60 from the Crescent, were received hy Openheimer & Co., in this city, yesterday, for shipment to San Francisco.

The Prospects.—Cope district, to-day, stands where White Pine did one year ago, and will, 12 mouths hence, occupy as prominent a position as does White Pine at present. Scarcely a day passes but we hear of some new mining strike within the houndaries of Elko county.

Placers.—The *Enterprise* says the surface diggings in Cope are likely to be largely worked next year. The extent of ground is great, and the specimens of scale gold brought in are very fine.

Bull Run.—On Monday we had a call from W. L. Grover, one of the pioneers of Bull Run district. Up to the present time there have heen some 200 locations made. The ledges are all regular, and come to the surface with distinctness, From most of them ore has heen taken and tested hy pan process, giving satisfactory results. A quantity of ore from the Porter, lately worked hy the English mill at Reno, returned $255 per ton.

ESMERALDA.

Pine Grove.—*Enterprise*, 4th: Mr. Wheeler informs us that all the mines are looking well, and the miners well satisfied to stay where they are. The principal leads are improving. The ore is rich and pays evenly.

HUMBOLDT.

Dun Glen.—Cor. of *Register*, 4th: The Tallulah Co. has decided to run a lower tunnel for development of their ledges. The new tunnel will he 250 feet perpendicular helow the upper one, and will not only give them a vast quautity of rich ore, hut also drain the mine. Sufficient ore has beeu worked to warrant further outlay.

The Alaska Co. is still sinking and taking ont ore sufficient to pay expenses.

They are down 40 feet and the ore is rich.

The Diamond mine, owned by Pollard & Co., is improving. Their shaft is sunk 45 feet, and the ledge is increasing in width. ....The Gem is produciog rich ore, which the proprietors are hanling to the Essex mill for reduction.....The work on the Chihuahua is progressiog. A layer of chloride ore of six inches in width is following the wall. The country rock is very hard, and tho work goes slow. The ore taken out pays handsomely....The Yosemite mino owners have been shipping another lot to Sau Francisco. The ore from former shipmeuts assayed from $300 to $1,200 per ton.

MINERAL HILL.

MINERAL HILL.—Humboldt *Register*, 4th: Roports are eneouraging. The mines aro 40 miles south of Carlin, the nearest point on the railroad. The deposits are extonsivo, and the ore of the richest is yielding by mill process from $200 to $1,000 per ton. Wood is plenty. A contract for building a mill on one of the principal mines has been let to responsible parties, who have agreed to have it iu running ordor in 90 days.

REESE RIVER.

SUPERB ORE.—*Reveille*, Dec. 2d: The Troy mine, Lander Hill, is produeing fiue ore in unusual quaotity. In a lot seut to the Manhattan mill for reduction this morning, there was a lump that weighed 900 pounds; the largest mass of ore, we believe, ever taken from any mine in this district. Same of 3d says: We have since learned that the value of the mass was estimated at $400—the estimate being based upou the ascertained value of similar ore.

EUREKA.—Col. Robbius' smelting furnace was pouring out metal, at last aceounts. Our informant says the town site was purchased by Col. Buel and I. C. Bateman, who are selling lots at handsome figures. He adds: Before the winter snows have melted, this district will possess as large a population as Austin, and a score of smelting furnaces.

The hoisting works of the Harvard Co., at Yankee Blade, are to be removed to Eureka, where the engine is to be used for the smelting works of Buel & Co.

WASHOE.

HALE & NORCROSS.—Gold Hill *News*, 4th: The body of ore still cootinues to increase in size. A large amouut of high grade ore is developed, a sample which we saw this morning being a solid mass of black sulphurets and green chloride.

OPHIR.—The water is some 400 feet deep in the new shaft. The pump and bailing tanks reduce it in the old shaft at the rate of 5 feet per day.

GOULD & CURRY.—Owing to the breakage of the crank shaft of the pump engine, last Snnday, work was suspeuded in the 7th level. The bailing tanks, however, keep the water reduced. The old upper workings show an improved yield.

YELLOW JACKET.—The daily yield of low grade ore from the old north shaft is 165 tons, which is all shipped to Carson City, on the railroad. From the south shaft the daily yield has been 225 tons until the last two or three days, there beiug a cessation for repsirs.

NORTH OCCIDENTAL.—The old St. George claim is being incorporated under this name.

OCCIDENTAL.—The north body still holds out its yield of superior ore. The face of the lower tunnel is in good ledge matter.

CHOLLAR-POTOSI. — The new hoisting works were started up a few days since, and prospecting at the 1,400-foot levcl will be resumed.

TWIN.—There is said to he ore enough in sight to yield $8,000 per month for the next four months.

BELCHER.—The body of ore at the 152-foot level still holds out well; average assays $34 per ton.

CALEDONIA.—The main Comstock ledge was cut on Wednesday, in the drift west, at the 100-foot level, 55 feet from the shaft; and they are now taking out pay ore for milliog. It will yield about $20 per ton.

CROWN POINT.—The east drift at the lowest level is 510 feet in length from the shaft, and the face is still in vein matter showing no ore.

SIERRA NEVADA.—New engine in position, other mill machinery being fixed, and all will be ready in two weeks.

SAVAGE. — No increase over the usual yield, and no improvement noticeable.

OVERMAN.—Daily yield, 145 tons, milling $20 per ton. Plenty of ore in sight.

KENTUCK.—Going ahead satisfactorily.

IMPERIAL-EMPIRE. — Both sinking and driftiug progressing satisfactorily.

MILL PURCHASED.—The Devil's Gate Mill, in Gold Cañon, has been purchased by Fair & Mackay, and will be run on ore from the Hale & Norcross. Its capacity is 25 tons per day.

ITEMS.—*Enterprise*, 3d: Wiegand & Co. yesterday received from the Birdsall Mill, Dayton, 1,065 pounds of crude bullion for assay, the result of their last clean-up.... A party of men went out yesterday to relocate some of the mines in Castlo District. Good prospects were ohtained there in 1861-2.

SUTRO TUNNEL.—Same of 5th: Last evening the Tunnel was in 254 feet. They made 39 feet last week. The ground was hard during the early part of the week, hut is now more favorable.

WHITE PINE.

WEEKLY MINING REVIEW.—*Empire*, Dec. 5th: The past week has been the most prosperous in the history of miniog in White Pino. The weather has been unusually favorable, and mine owners, as a rule, havo been extremely active. The mills have all heen kept busy, and the bullion product is largely in excess of any previous week's work since the first pick was struck. The increase is chiefly due to the South Aurora and Original Hidden Treasure mines. Most of the other productivo mines have also yielded an increased amount of ore. Taking all in all, the situation is most gratifying.

BULLION.—*Empire*: Our shipments for the week aggregate $119,078.95 against $51,493.13 last week. In addition to this, Wells, Fargo & Co. have on hand $20,000 in hars which they were unable to send forward yesterday. From seven to ten hars, worth, say $12,000, await shipment from the Stanford mill. Add the hase metal product, valued at $14,000, and we have a total yield for the week of $164,073.94. The largest shipment hitherto made from the district in a single week occured in July, and amounted to $76,538.17.

The *News* of 4th says: Our bullion shipment for the week amount to $101.080, and increase over the shipment of last week of $72,095, and the superintendent of the Stanford mill believes he will be able to send away $100,000 from his thirty stamps alone during the month of Deeember.

OUTSIDE DISTRICTS.—*News*, 4th: Eureka, on the Diamond mountaius, 40 miles west, is bidding fair to rival Treasure Hill in its richuess aud extent of its silver deposits. Silver Park is increasing in favor as tests are made of its ores. Some ore from the Great Eastern, the extreme location of the mineral belt, has been worked in Tregloan's mill aud yielded $100 the ton. The Park will have one or two mills at the earliest practical moment; and Shoshone, Sacramento, Cooper and Kern districts are moving in the matter of ohtaining mills.

ITEMS.—*Newe:* Aurora Consolidated sends to mill 80 to 90 tons daily. The Earl mine of this Co. is now the chief attraction of the district. On the 85-feet level the north breast, 40 feet wide and 20 high, has been pushed through solid ore a distance of 80 feet, and still no country rock is met with anywhere....Aurora South will ship $100,000 this month.... Consolidated Chloride Flat sent to mill 1,400 tons in November....El Dorado is sending to mill large quantities of good ore....Hidden Treasure proposes to increase stock....Pogonip & Othello bids fair to rival the Earl....Treasure Hill M. & M. Co. sends 10 tons of $100 ore to mill daily....Tom Paine has over 1,500 tons of $50 ore in sight.

ITEMS.—*Empire:* Original Hidden Treasure got $14,000 from 109 tons worked at Metriplolitan mill. Shipped $23,000 iu November....Eberhardt never looked hetter thau uow. Ore now being shipped mills $235 per ton on the average....Hartwell, on Bullion Hill, is turning out spleudid ore....Pocotillo looks better.... Mazeppa has good ore. Will work all winter....Domingo looks well....Rathburn smelting works have shipped 30 tons of hullion worth from $125 to $190 per ton, since they commenced work. The average yield of hullion is 1,000 pounds to the ton of ore....We saw Robertson smelting some Mt. Ophir ore yesterday. The first 10 pounds only went a little over one dollar a pound. The owner was disappointed. Deeper down in the sack it went $12 a pouud....H. M. Barnes brought in the first shipmeut of bullion from Silver Park yesterday: two small bars valued at $521. ....The mill at the Social and Steptoe mine, Egan Cañon was about starting up with 20 stamps. The ledge is4 ¼ feet wide.

MINERS aud others wishing ores crushed and sampled are referred to the card of H. W. Gray & Co., in advertising columus. The facilities there for testing, working and disposing of ores were never better.

San Francisco Mining Stock Market.

Whilo the reports from our mines during the past week have been more than usually favorablo, stocks have declined. The *Commercial Herald's* review, to Friday, Dec. 10, reports as follows:

The mining share market, duriug the past week, exhibited considerable animation, but, as a general thiog, the list of stocks usually called shows less firmness, and a gradual decline is noticonhle in a number of descriptions. Sales of Savage stock were quite large, and so of Original Hidden Treasure and Mammoth—all at a decline.

We uotice that the bullion shipment from the White Pine mines for the week ending December 4th amounted to $101,000, an increase of $72,000 over the shipments of the previous week. It is believed that the Stanford Mill, with its thirty stamps, will show a yield of $100,000 in bullion duriug the preseut month.

HALE & NORCROSS, under considerable sales, contioued to decline. On the sixth level, eross-cuts Nos. 2 and 3 have been connected in the vein, and they now have a continuous car-way io the ore-body from the shaft to eross-cut No. 3. The ore is reportcd to be excelleot at all the openings on this level. They are continuing the drift runniog north from cross-cut No. 3, the assays from the face of the drift showiog a continued improvement in the quality of the ore as they advance northward. For the week ending Decemher 4th, the upper mine yielded 287½ aud tho lower 854¼, making a total of 1,141 tons of ore, against 1,236¾ tons the previous week.

CHOLLAR-POTOSI has been less active than for some time past. During the week closing December 3d, they extracted 1,089 tons of ore; previous week, 1,165. No chaoge of importance in the mine. They are making preparations to work the ore remaining in the Blue Wiog and New Tunnel stops from the surface, the twenty-sixth floor being within ten feet of the top of the ground. The hulliou returns for the mouth of November aggregate $87,580, against $108,070 io Octoher, and $116,667 in September. A dividend of $1 per share is payable since the 10th inst.

KENTUCK has beeu in the market to about the usual exteot. The bullion receipts during the month of November amounted to $145,194. A divideod of $10 per share is payable since the 10th inst.

CROWN POINT maiotained its usual activity. On Decemher 4th the 1,000 level, east from the shaft, was in 369 feet, and the 1,100 level in the same direction 526 feet.

GOULD & CURRY has been in hetter request thau the previous week. During the week ending Dec. 6th, 389½ tons of ore were extracted, and during the same time they have discovered nothing of a favorable character in any section of the ore-producing portion of the mine. Most faces in the various stopes have a less promising appearance than existed a week ago. The bullion product for the month of Novemher amounted to $31,823.

SAVAGE sold to a large extent, at a decline. The returns for the month of November amounted to $31,200; in October they were $31,271.

DANEY levied an assessment of $1 per share on the 7th inst.

AMADOR (Cal.) sold at $296 per share. The bullion receipts for November were $58,083. A dividend of $8 per share is payable since the 7th inst.

EUREKA (Cal.) disbursed a dividend of $7.50 per share on the 7th.

NICKEL AND CHROME.—The presence of uickel and chrome-iron in the meteorites which enter our atmosphero, on their way from uowhere to nowhere, aud which are arrested, inflamed and brought to the ground, has always attracted special attention from mineralogists. Geologists ask why nickel and chrome should be so rarely fouud in a condition to mine from the rocks of the earth, seeing that they form a uotable proportiou of almost every meteorite. They only occur in our oldest formations. We may, therefore, expect that, for some chemical reason, their productiou has been dependent upon conditions which uo longer exist, at least in connection with the earth.—*U. S. Railroad Register.*

ANILINE DYES.—Aniline dyes have little affinity for cotton fabrics, while uniting readily with woolen. It has beeu found, however, that by first impregnating the vegetable fibre with an animal substance, such as a solution of the white of an egg, and drying it, these dyes will attach quite as readily as to wool.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Dec. 9, 1869.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		*Per ton*
12 per cent. ore.....	$24 00	18 per cent. ore.....	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

"LINEN" FROM THE BROOM PLANT.—A letter from Calabria, Italy, thus notes a manufacture which is new to us: "In Calabria, in some districts, especially in the Albanian ones, no linen is made except from the broom plant. Hemp we hardly cultivate, and flax is only used by people in easy circumstances. The following process is employed to render the broom fit for spinniug: In August, when the young plant has attained its full consisteucy, it is gathered point by point, and bound in bundles of a diameter of about five centimetres each; then boiled for several hours in a large caldron. When the fibrous part only remaius the bundles are removed from the caldrons, and carried to some stream or torrent, where they are allowed to macerate sufficiently, after which they are withdrawn from the water, and undergo the necessary preparations. The linen which is made from the broom is white, strong, and lasting."

GLYCERINE TO PRESERVE WINE.—Herr Kolb proposes to add from one to three per cent. of pnre glycerine to new wine to prevent the tendency to change.

San Francisco:
Saturday Morning, Dec. 11, 1869.

Notices to Correspondents.

Hydraulic Miner, Spanish Ranch.—To answer your question fully and exactly would occupy too large a portion of our paper. An approximate value for the amount of water which escapes is given by the formula $I=193.9\times a\times b\times\sqrt{h}$, where I=the amount in miners' inches, a=the height and b=the width of the aperture in feet, and h=the head ot water,—that is the height of the surface of the water above the center of the aperture in feet. Thus with the gate raised one inch, the aperture being 17 inches wide and the height of the water 22 ft. above the bottom of the aperture, we have $I=193.9\times 1\frac{1}{2}\times 1\frac{7}{2}\times\sqrt{22-\frac{1}{24}}=106$ inches nearly. With the same aperture, the amounts of water will vary in *about* the ratio of the square root of the heads (h). With different heights (a) of the aperture (b remaining constant) the amounts will vary in about the ratio of the products of the height (a) into the square root of the head (h).

Work at the Foundries.

The dullness of the times affects greatly the foundries, at which but little is going on at present, except in the line of job work, with which all seem to be about equally supplied. The Risdon Iron Works are engaged upon large hoisting-works for the Imperial mine at Virginia City, a set of four boilers for the Navy Yard, a number of propellers, gas-work castings, machinery for Mexican cotton mills, etc.

The Pacific Foundry is casting the house-front for Bancroft's new building on Market street, and doing considerable in the way of steamboat and similar jobs.

The Union Works are rebuilding a Corliss engine and overhanling the mill and pumping machinery for the Oneida mine, to work the body of rich ore recently struck; building a new engine and a set of twenty stamps for the Keystone, and pumps for the Amador. The position which they took with regard to the "Union" last June has proved, they say, entirely successful.

The Ætna is working on hoisting and pumping works, with water-wheels of the Tyler pattern, for the Havilah mine.

The Golden State is busy on castings, etc., for the Knoxville quicksilver mine; a ten-stamp mill to go to Railroad Flat, Calaveras county; four propellers, and miscellaneous work for the Los Angeles Water Co.

The Fulton Works are building a hoisting engine and works for the Pittsburg coal mine, two engines for the Paper Mill at Saratoga, and capstan, store-hoists, etc., of the Waterhouse & Nichols' pattern.

The other works are busy with a lot of miscellaneous jobs, too numerous to mention.

"Across the Continent" travel, by rail, is less than when the road was first opened; but the number "going West" appears to be much greater than that going East—whereby California is a material gainer in the way of population.

Colorado River Exploration.

Captain Samuel Adams, of the War Department, has been exploring the region of the Colorado river for the last five years, and the Washington *Chronicle* publishes his report. The Captain appears to have been much pleased with what he saw, and his account is very pleasant to read. He finds the valley of the Colorado, for 115 miles from its mouth, to be very fertile, and equal, if not superior, to the Sacramento Valley. Here is an abundance of certain kinds of wood, as the willow, ash, mesquite and cotton-wood; and wheat, barley, corn and melons are already raised by the Indians. Above Fort Yuma, for some 300 miles, numerous unconnected rich valleys are found. At the Mohave Valley, 350 miles from the mouth of the river, there is a very rich valley over thirty miles long.

The scenery of the Chimewava, Mohave, Black, Long, and Painted Cañons, is grand in the extreme. In the Painted Cañon, the different colored strata give a most peculiar effect. The Black or Big Cañon is thirteen miles long, with perpendicular sides 800 to 1,500 feet high.

In Central Arizona are numerous ruins of cities, fortifications, canals, mines etc. One of the most prominent is that of the Hall of the Montezumas, which stands several stories high. Such is the dryness of the atmosphere that the cedar posts of the doors and windows are in a perfect state of preservation, although very old. At Tubac is a more modern ruin. This city was inhabited but a few years since; but the Apaches had been there and laid everything waste.

For a distance of 160 miles along the Colorado river one sees constantly leads of gold, silver, copper and lead. At the head of Painted Cañon commences a white strata of rock, which extends for miles across the country, which is extremely light, and of the most superior quality for polishing silver ware. The Captain seems greatly impressed with the mineral resources, and believes that "there are nor icher gold and silver mines in the United States than those commencing at the western slope of the Rocky Mountains and extending throughout Arizona."

New Way of Cleaning Boiler Tubes. Our readers will recollect the novel plan adopted, during the late Mechanics' Institute Exhibition in this city, of cleaning the tall smoke stack surmounting the boiler furnace, at the Pavilion, by firing upward, through the same, a charge of small shot. The work was instantaneous and very effective. Somebody at Vallejo, according to the *Recorder* of that place, has since employed powder for cleaning boiler tubes. The tubes of a steamboat boiler, having become stopped up, were expeditiously and thoroughly cleaned by igniting half a pound of gunpowder, and by the rush of gas thus produced, accomplishing, in an instant, and without labor, a work which would have consumed much time in the ordinary mode of performing the same.

The Territory of Wyoming, still of a tender age, has decided to give to its mammas and sisters the right of voting. The Governor has not as yet signed the bill to this effect, which has been passed by the Legislature, but his wife will take care of that. It is supposed that now immigration will rapidly set in, and soon there will be a shrill cry for admission as a very "sister State" into the Union.

The editor of the Sacramento *Union* has seen samples of the ramie plant, raised in this State, in all its stages, from the raw material to the cloth. It has been introduced into the southern part of the State, and, so far as heard from, its cultivation bids fair to be a success.

New Substitute for Coal.

Experiments have lately been made in Brazil on "turba" or brown coal deposits, which have been found in the province of Bahia, on the banks of the river Marahu. These deposits are said to lie under a thin layer of sand, to average about thirty feet in thickness, and to exist in almost inexhaustible amounts; moreover, their situation affords ample facilities for working and shipment. The experiments tend to show that the substance gives off gas easily in larger quantities and of greater brilliancy than common coal, one ton of the turba yielding 12,000 cubic feet of 37-candle gas. Moreover, it yields an excellent oil for burning as well as lubricating, and the refuse of the material forms a valuable fuel. In the immediate vicinity of these deposits are large amounts of petroleum, similar to that obtained in Pennsylvania. The turba, having great absorbent qualities, will take up a large amount of liquid petroleum, which increases the specific gravity and also the supply of gas. An English company has been formed for the purpose of working the deposits under a concession from the Brazilian Government.

These statements, which appear to be well verified, are very interesting. Some time ago the world was excited on the subject of the probable exhaustion of the known coal beds. French chemists have been endeavoring to find some cheap way in which refuse matter, as chips, rags, or any organic substance, could be utilized for heat and light by resolution into its gaseous elements. But it seems probable that at least for a long time natural products will be cheaper and thus preferable. We need a greater knowledge of what treasures are still stored up in nature, especially in this State, of which we really know so little at present, and we hope that steps will be taken for a thorough investigation of our natural resources. Seeming economy in this matter is no economy, but a liberal allowance of money for this purpose will be repaid with compound interest, and that in no great lapse of time.

The Pacific Straw Works.—The attention of visitors at the Pavilion during the last Fair was attracted by a queer-looking machine situated in the music room, over which was the sign of the Pacific Straw Works, 335 Bush street. Until the time for lighting the gas, visitors gained very little information; after that time they received an insight into one of the most important (especially to the fair sex) enterprises of the city. This firm manufactnre every kind of straw, felt, illusion and buckram goods that the trade requires, for which they have every appliance that an experience of twelve years can give them. Two of the original proprietors are now in the firm. They started about 1857, on Ritch street; from there they moved to the corner of Market and Second, and then in 1866 to the premises now occupied by them at 335 Bush street, where they have ten presses capable of turning out 200 dry buckram frames per day. Besides the hands employed in the frame department, they also employ straw-sewers, straw and felt pressers, cleaners and dyers; also, illnsion frame makers. They keep a pattern maker, who is employed in getting up new styles. During the present dull times they have 21 persons employed, and in bnsy times find work for about 50. They supply the milliners and merchants in all parts of the Pacific coast, from Oregon to San Diego; also, Utah and the Sandwich Islands. Any one interested in those industries that serve to advance our importance as a self-producing State, would do well to spend a few hours in examining this branch of California manufactures.

Fruit in Michigan.—A fruit grower in Michigan has cleared $17,000 the first year from his peach crop.

A New Mill for a New Process.

We have had the pleasure of inspecting a large model of a new style of quartz mill, which is in a decidedly new channel, in both a mechanical and metallurgical sense. We cannot at this time give the details, which we reserve for a future issue. We would say, however, that after the stamps, it is a system of cylinders and precipitating vessels, which are operated upon electrically, while at the same time the pulverization, preparation, amalgamation, precipitation and concentration are effected entirely by machinery and without manual labor. Excepting the delivery of the ore into self-feeders for reducing, there is no further handling of it. The precious metal even, collected at each charge of 1,000 pounds, is conveyed by the mercury to, and deposited in, an iron safe, so that only he who carries the key can see, much less handle it. After depositing safely the precious metal, the mercury passes off and back to the points, whence it again goes on its amalgamating errand. This mill is designed for the process to be known as

Paul's Electric Dry Amalgamating Process.

The designer and inventor is Mr. Almarin B. Paul, who probably has had more varied and practical every-day experience with our California and Nevada gold ores, than any other man on the coast. He was among the first to build a mill in this State, and did build the first silver mill in Nevada, to work the Comstock ores on the spot, at a time when it was thought that they could not be worked there.

The model and system would at once be put before the public, but Mr. Paul, having an engagement to go to Colorado to erect his mill there, this will necessarily be delayed until his return.

The results of working this system on a large scale by Mr. Paul and others, show it to possess merit to an extent which calls for the attention of millmen to the system as it progresses. Mr. Paul claims that he can erect mills for his process at one-half the ordinary expense now incurred, can work much closer and at less cost for labor, power and repairs, and can treat successfully any kind of ore, be it impregnated with base metal or not, besides producing bullion free from impurities. One man can handle a 5-ton mill and not work one-half the time. A 10-ton mill will cost less in proportion than one which works five tons.

Combination of Nature and Art.—Not satisfied with the mere delineation of the face in black and white, photographers are calling to their assistance the talent of the artist, whereby they are enabled to give their patrons exquisite and faithful portraits in oil or in water-colors. In this city there is an establishment where such portraits of superior excellence are to be obtained, and we recommend our readers to pay a visit to Mr. Howland's New York Photograph Gallery, No. 25 and 27 Third street.

We have received from the glass works at the Potrero a piece of glass that has been allowed, after fusion, to cool slowly. The tendency in such cases being always to crystallize, the lower part of the piece in question is composed of globular crystalline masses, which, seen through the upper transparent part, present a very pretty appearance.

The Hearth and Home is one of the best family papers which comes to our table. It is a journal of real worth and excellence; its columns being filled with useful and profitable reading for old and young. It is always fresh and attractive, and though not yet a year old, has already taken a position in the front rank of American journalism.

We have a few Sacramento items, which will appear soon.

The State Legislature.

The Eighteenth Session of the California Legislature convened in the new capitol, at Sacramento, on Monday, and both branches soon effected an organization. The personal appearance of the members is above the average of their predecessors, and we hope they will give us a better quality and a less quantity of laws than in former sessions.

THE GOVERNOR'S MESSAGE.

Governor Haight delivered on Thursday his message to the Legislature. All parties join in praising the document, which is remarkably clear and impartial. The funded debt of the State has decreased over a million of dollars in the last two years, at the same time that the taxes have been reduced. The Governor recommends the following: Equalization of assessments and the formation of a State Board of Equalization; the survey and sale of mineral lands, and the withdrawal of all public lands from private entry and their disposal to actual settlers only; legislation to prevent the indiscriminate killing of small birds, which are so useful to the farmer in the destruction of insects; that a portion of the proceeds of the tide-land sales be devoted to the fund of the University; some allowance for the militia; that the management of the State Prison be taken from the hands of the State officers, and given to a Board of five Commissioners, one to retire every other year, with power to appoint a Warden who is to appoint the subordinate officers; moreover, the introduction of the so-called "Irish Prison System;" the repeal of the present mode of selecting Directors for the Insane Asylum, and the passage of a law providing for the appointment of eight or ten Directors, one to retire each year, who may select such resident and assistant physicians as are required, and have power to make removals for cause only, the Resident Physician to appoint and discharge subordinates; that the State Geological Survey be continued under Prof. Whitney; the repeal of the Agricultural Bounty Bill of 1862, which may lead to perplexing questions to the detriment of the public revenues; legislation to facilitate proper immigration; that the proposed constitutional amendment, prohibiting appropriations of money for a longer period than two years, be submitted to the people. The Governor urges a strict adherence to the policy of economy, and closes with sound, although perhaps not novel, remarks.

TITANIC IRON.—Ilmenite, or titaniferous iron, has been mined more or less in Norway for some time, and brought to England for fettering puddling furnaces, for which purpose it is especially adapted. But this did not pay; and as chemists have failed to smelt it, except at too great cost, the mines were given up. Recently attempts were made to make bricks with this ore in combination with fire-clay, for the purpose of lining furnaces. Some of the prepared bricks were placed on the bridge of a furnace to try them; but as soon as the ingredients of the clay were reduced, the bricks disappeared. Here was a clue to the flux required; and now the ore is regularly smelted, producing a remarkably fine kind of iron, superior even to Swedish.

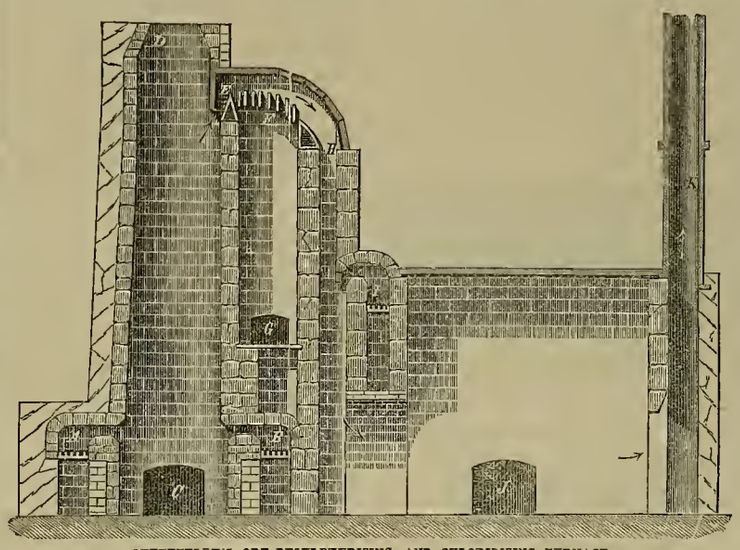
WHY HARD WATER IS NOT SO GOOD FOR WASHING AS SOFT.—Hard or spring water, in percolating through the ground, becomes charged with various substances, which it dissolves in its course. The most common salt in it is sulphate of lime. When soap is used, the sulphuric acid unites with the alkali of the soap, whose fatty acids thus set free unite with the lime, forming an insoluble earthy substance, which floats on the surface of the water. The soap thus losing its influence, the water feels hard, and imperfectly performs the functions of ablution.

The Stetefeldt Furnace at Reno.

We have spoken in a late issue of this furnace, which has been running at the mill of the Nevada Land & M. Co., near Reno, since the third of November, roasting a great variety of ore. Mr. Stetefeldt has lately called on us, and kindly furnished us notes, from which we write the following, and that all the more readily, as of late several inquiries have been made with regard to this and similar furnaces.

The annexed engraving will convey a correct idea of the construction of the furnace. The ore, crushed together with the necessary amount of salt, is sifted into the shaft, D, in a continuous stream. In falling about twenty-five feet through the heated air and chloridizing gases, its chlorination is effected almost instantaneously. As soon as a charge of about 1,000 pounds has accumulated at the bottom of the shaft, it is discharged through the door, C. By charging the fire-places, A and B, alternately, a very uniform heat is obtained.

As the pulp is very fine, a large percentage of dust is formed, which is carried forward by the draft through the flue, E.



STETEFELDT'S ORE-DESULPHURIZING AND CHLORIDIZING FURNACE.

This dust is created in two ways: first, by the very finest particles of the pulp, which escape at once through the flue, E; second, by those particles of the ore which fall a certain distance down the shaft, get roasted, lose in specific gravity, and are again carried upward by the draft. The latter settle down into the dust-chamber, G; the former descend through the flue, H, into the dust-chamber, J.

This dust, which forms from twenty to thirty per cent. of the whole bulk of the ore, would be very imperfectly roasted if its chlorination were not effected by the application of the fire-place, I. The flame of the fire-place meeting the dust, together with the chloridizing gases arising from the main shaft, effects instantaneously its complete chlorination. This is quite an important feature: that the finest particles of the ore, no matter where they settle in the extensive system of dust-chambers connected with the furnace, are perfectly roasted, and at once ready for amalgamation.

The furnace in Reno has a capacity of from fifteen to twenty tons every twenty-four hours. The workmen necessary to run the furnace for twenty-four hours are: two men to attend to the feeding and conveying machinery; three firemen; and three men to discharge and cool the roasted ore. As the latter take at the same time the ore to the pans, only one-half of their time should be charged to the roasting. The amount of salt used is six per cent.; but we believe that this percentage could be lowered still more. From two to three cords of wood are burned in twenty-four hours, depending upon the amount of sulphurets in the ore. Taking these figures, the expense of running the furnace for twenty-four hours in Reno is:

Labor of 6½ men at $3	$19 50
Wood, 2½ cords at $6	15 00
Salt, 1,800 pounds, at 1½ cents	27 00
Total expense of roasting 15 tons	$61 50

Or $4.10 per ton. Calculated for a capacity of twenty tons, the total expense would be $3.52 per ton.

The expense of roasting in reverberatory furnaces would be, in Reno, from $11 to $12 per ton.

From a large number of chlorination tests, Mr. Stetefeldt found that from 88 to 92½ per cent. of the silver is chloridized. This certainly is a very favorable result, considering that it was obtained at the very beginning, and with laborers unskilled in the management of the furnace. A number of improvements have been devised, which will reduce the expense of roasting still more.

Mr. Stetefeldt adds the following: "The Stetefeldt furnace has been confounded by some with the Gerstenhofer or the Terrace furnace of the American Metallurgical Co., of New York. The Gerstenhofer furnace is a shaft filled with shelves or inclines, and is intended to desulphurize and oxydize certain ores and smelting products. The Stetefeldt furnace is a plain shaft (with fire-places attached), through which the ore, mixed with salt, falls for the purpose of being chloridized. It is, furthermore, provided with a fire-place for the roasting of the dust, which in the Gerstenhofer furnace escapes unroasted.

"Stetefeldt, in his first experiments in Austin, erected a Gerstenhofer furnace for chloridizing roasting, and found that it was entirely unfit to do the work. The reasons are:

1st. The ore does not drop down the shelves, but sticks to them, and stops up the furnace in a short time.

2d. From 20 to 30 per cent. of the ore escapes unroasted through the flues.

"The Gerstenhofer and Stetefeldt furnaces are, therefore, two very distinct inventions, aiming at the same time at different ends."

The inland papers are very enthusiastic on the subject, and pronounce the furnace a "complete success." We find, moreover, little items which are of greater weight than mere words. For instance, the Reno *Crescent* speaks of two lots of ore worked: one, which would have yielded $69 net per ton if sent to San Francisco, actually *did* yield to the owners $94; another, which did not pay to ship to San Francisco, netted the owners $30 per ton. Such facts as these are the very arguments needed. This furnace was patented by Chas. Stetefeldt, of Austin, Nevada, Dec. 31, 1867.

Since the above was in type we have received a letter from a party connected with the furnace at Reno, from which we make the following extract: "The furnace has been running continually since starting up, on the 3d ult., and over 400 tons have been put through, with a uniform success. Many millmen have been here, who endorse it as being the thing, and assert that it will take the place of all other furnaces for chloridizing ore. I am not interested in the furnace, further than the rights acquired for working the ores of Humboldt county, and only give this information for the benefit of the public."

Summary of U. S. Mining Statistics.

Not having had time to complete his annual report before the meeting of Congress, Mr. R. W. Raymond, the Commissioner of Mining Statistics, has prepared a summary of his mining operations during the year. Colorado, Utah, Nevada, California, Oregon, and Idaho have been visited. The prospects of Colorado are regarded as very flattering. The product of bullion from Oregon and Idaho is unusually small, principally on account of the extraordinary drought. The product of California also will probably be less than that of last year, for the same and other causes. In Nevada, the greater yield of White Pine will probably at least counterbalance the deficiency from Washoe. The Commissioner thinks, however, that he sees a brighter future in all mining regions.

Mr. Raymond urges strongly the founding of a National School of Mines, which he regards as an imperative necessity; and in this we think he will be supported by all connected with the mining interests of the country. Private mining schools do not seem to fulfill all the requirements. A national school would probably be supplied with competent instructors, and many would be able to avail themselves of its advantages who now are unable to get the instruction which they desire. Moreover, as particular attention would of course be given to American ways of mining, milling and smelting, not only would information be disseminated generally, as to exactly what has been, and is being done, but as a result of this, great progress would undubitably follow.

New Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR THE WEEK ENDING NOVEMBER 30th.

PITCH-BOARD.—John R. Drew, San Francisco.

FAUCET ATTACHMENT TO CANS.—John H. Garrigan, Sacramento, Cal., and Francis L. Hall, Reno, Nevada.

GRAPE CRUSHER AND STEM SEPARATOR.—Turner C. Purington, Lincoln, Cal.

CHAIR SPRING.—Turner C. Purington, Lincoln, assignor to himself and Antoine Mayoux, Marysville, Cal.

WATER-CLOSET PAN.—W. Smith, San Francisco.

ANCHOR.—Elisha Trask Barlow, San Francisco.

BELLY-BAND FASTENER. — Chas. H. Horne, Astoria, Oregon.

ACTION OF ACIDS ON AMALGAMATED ZINC.

The resistance of an amalgamated surface of zinc to dilute sulphuric acid, has been attributed to its uniformity. An irregular surface favors the action of the acid. Daniell inclines to the view that it is the appearance of hydrogen bubbles on the prepared surface which prevents the access to it of the water; to prove which he showed that dilute nitric acid in the sulphuric will dissolve the zinc sheet within a few hours. D'Almeida has lately published some experiments, which show that after removing, by mechanical means, this coating of bubbles, it will at once again make its appearance, and its removal from the zinc will further the action upon it. The solubility of the amalgamated zinc is largely increased by a mixture of acids—such as sulphuric with hydrochloric, sulphurous acid, etc. Polished metallic surfaces alone retain their hold of this gas to a certain extent, but not as fully as those amalgamated. It seems simply to be the amount of polish which determines the escape of the gas.

Reading for the Hour.

John

Is going to have a hard time of it, according to appearances. A certain society of this city has been visiting his abodes, looking under his beds, examining his gods and other household furniture, analyzing his peculiar perfumes, measuring the length of his cue, and testing his honesty and her virtue in ways unknown to the public but highly satisfactory to themselves. The result of all this visiting, looking, examining, analyzing, measuring and testing, is that John's abodes have been declared unclean, his beds dirty, his gods and furniture cracked, his perfumes stronger than the law allows, his cue of a disrespectful length, his honesty and her virtue wanting; or, in a word, all Johns are thieves.

Now, John, you thief, we propose that you shall leave these sunny shores. Take your cue in your hand and walk. Go to your home, where they don't want you; or go East, where they think they do. But don't go by way of Tennessee, for as sure as you present your smiling, copper-colored countenance at the door of that State, so soon will your aforesaid countenance change its color and its aspect; for the august body which guides the helm of that country has solemnly resolved, declared and sworn, that it will punch the nose of any John that tries to intrude his unwelcome presence on the people of Tennessee.

But hold on a minute, John. If it really would be very hard on you not to be allowed to remain in our glorious State, perhaps we'll let you off easy. Yes, John, if you'll pay us $500 apiece, and agree to give us a fifth of what you steal, perhaps we'll let you stay. We won't promise positively, but *perhaps* we will. Now we think of it John, we guess you'd better make this little arrangement and stay with us, and perhaps, by and by, if you improve in these little ways of yours, which we've found out, perhaps we'll get you on the Board of Supervisors, and then, my eyes! John won't we enjoy ourselves?

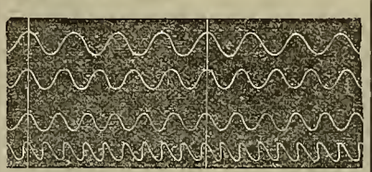
Assembled Wisdom.

This week assembled four, more or less important bodies—the Œcumenical Council of the whole world, the Congress of these United States, the Legislature of this particular State, and the Board of Supervisors of our own peculiar city. From the first of these bodies we do not expect anything, and it would do no good if we did; from the second we are allowed to hope for some good results; from the third we expect very much, from the good and lengthy advice which we in common with all the other papers have given, and shall continue to give; but the very first action of the last induces us to button up tightly in our pockets our few remaining "bits" and look on anxiously from a distance. A few more "cuts" into our purses, a couple more of $90,000 bridges, and a hospital or two thrown in at the tune of half a million or so, will lead us to contemplate, with more seriousness than we formerly thought we possessed, the superior advantages of a quiet life in some retired country town. We don't fancy the sound of another golden "ring," which faintly echoes in our ears, "ever near and louder sounding."

The irrepressible Train is still going, and having reached St. Louis has relieved his mind by expressing his unfavorable opinion of the country in general, and of several cities in particular. The whole Pacific coast is, according to his idea, a grand humbug, Chicago and San Francisco are a couple of dead-heats, St. Louis people a set of sleepy drones, New York is dependent entirely on Vanderbilt, our principal men are a set of fools, etc. The only decent place in the whole Union, we infer, is Omaha, and George Francis Train is the worthy father of it.

What Sound, Light and Heat Are.

Every one who has dropped a stone into the water of a still lake has noticed the system of waves which, with its ever-increasing circles, spreads in every direction from the stone. So when two stones are struck together in the air, a similar system of aerial waves spreads in ever-widening spheres through the atmosphere, and these waves, breaking on the tympanum of the ear, produce the sensation called sound. Two stones thus struck together give rise to waves of unequal length, following each other at irregular intervals; and such waves produce on our auditory nerves the sensation which we call noise. But if we set in vibration the string of a piano-forte or the reed of an organ pipe, we excite a system of waves of equal size, which succeed one another in perfect regularity, and these breaking on the ear produce what we call a musical note; and it has been proved that the faster the waves follow one another, the higher the note. A simple way of showing this, is as follows: Attach needles to one prong each of several tuning forks. Now, if these forks are set in vibration, and a piece of smoked glass drawn across the points of the needles, the soot on the glass will be scratched off in wavy lines, and the higher the note of a fork, the greater number of curves it will mark in the same time. The accompanying cut exhibits the curves of a common chord, the upper and the lower lines being those of the octave.



In the same way every luminous body, as for instance, a candle flame, excites a similar system of waves in the medium which we call *ether*—a medium more subtle than air, and which, as we assume, pervades all space, and this, too, whether the space is filled or not, at the same time by other forms of matter; and it is these hillows which, passing through the humors of the eye and breaking on the retina, produce the sensation we call light, or falling on the skin, excite the less delicate nerves of feeling and cause the sensation of heat. Moreover, from actual measurements, we find that the difference between colors is of precisely the same kind as the difference between notes. Thus we find that when the number of waves is 477 million millions per second, the sensation of *red* is produced; when 506 million millions, *orange;* when 535 million millions, *yellow;* when 699 million millions, *violet*. Between red and violet come the other colors of the rainbow.

Moreover, we have proof that there are waves in the ether far smaller, and undulating far more rapidly than those which produce violet light; so small that they do not even jar the nerves of the retina, but which, nevertheless, breaking on the prepared plate of the photographer, leave there an impression which, developed by his skill, becomes a beautiful copy of nature or of art. On the other hand, there are waves in this same ether so large that the delicate retina cannot vibrate in unison with their rough beats, but which, breaking on the surface of the skin, disturb the coarser nerves of feeling and produce the glow of heat. Most of the waves which impress the optic nerve will also affect the nerves of feeling, but many waves which produce the sensation of heat are far too large, and undulate too slowly to set in vibration the retina of the eye.

As the ether-waves, breaking on the eye, more or less rapidly, produce the different sensations of color, so when breaking on skin, they occasion differences in the sensation of heat. There are waves of heat which break on our nerves of feeling like the shrill cry of the cricket on the ear, and seem to penetrate to the very brain, while there are others which fall like the low tones of an organ, diffusing throughout the system a genial glow. Such, for example, is the difference between the heat from a hard-coal fire and that from a steam radiator. The waves of the first sort, from their small size and rapid motion, can readily pass through glass and other transparent media, when the large waves with their slow motion are in a great measure stopped. —*Prof. Cooke.*

Did the Ancient Egyptians Understand Photography.

This question pleasantly opens an article upon photography in the *Engineer*.

"Once upon a time Mr. Wm. Herapath, the toxicological chemist of Bristol, unrolled an Egyptian mummy, tumbling it over and over as he wound off yard after yard of bandages. The lengthy wrappings were marked with hieroglyphical characters, and where the ink appeared to have run the stains looked very much like those of nitrate of silver. Our chemist at once put a piece of stained linen under the blowpipe, and obtained from it a button of metallic silver; it is therefore, he concluded, certain that the ancient Egpytians knew how to dissolve silver and make it into a permanent ink. Yet nitric acid was not known in Christendom till 2,200 years after the date of this mummy, and it must be remembered, that nitric acid could only be obtained by the use of sulphuric acid. The bandages were the natural color of the flax, except where some of the threads had been dyed with indigo. Here and there figures were painted upon the cloth with vegetable reds, and the paint upon the face was made of finely powdered chalk.

Now neither the Egyptians nor anybody else could long use nitrate of silver in solution without finding out that fingers or other things smeared with it turned black in the light. To what degree then is it possible that their knowledge of photography extended? It is certain that the Egyptians made beads of crown glass 1,500 years before the Christian era. They possessed some knowledge of chemistry, for their glasses are colored with metallic oxides; they knew how to work glass, for paintings and pieces of sculpture of theirs representing glass-blowers at work, have been found in their temples. They also knew how to work glass, in some respects, better than the English; for they made solid rods of glass, with most delicate pictures running through them from end to end, so that if the rod were cut into little circular slices each piece would show the picture quite perfect.

The ancient Egyptians knew how to make glass lenses, and their knowledge of glass-making spread among surrounding nations. May these people not only have been "up" in the rudiments of photography and photographic optics, but also in the "waxed paper process," in the "tannin process," and in the photographic properties of the bitumen of Judea? This much is certain, that respectable mummies were often saturated with tannin, soaked in wax, and gilt all over outside. But if they took photographs, why do we find none in their tombs? If all the photographers in Europe were buried a fathom deep to-morrow, and all their works with them, it is probable that their pictures would fade off the paper nearly as fast as their flesh wasted off their bones. No photographer would like to guarantee that the pictures taken by any of his neighbors will continue unchanged for ten years, and few but pictures taken by the carbon process, or transpareucies cemented between two plates of glass with Canadian balsam, are likely to last in good condition more than a century."

Sacramento is having a sudden spasm of virtue. The susceptible young men of that city have been taken under the especial tutelage of the police, who remove temptation from their eyes by removing the "pretty waiter girls" to the lock-up. Ugly girls, we presume, are still allowed to act in the capacity of Hebes. But as the idea of beauty is somewhat comparative, we are curious to ascertain how and where the line is drawn between the pretty and the homely ones. Does the Mayor or the Board of Aldermen, the Chief of Police or the judicial bench, decide on this point, or is the decision left to the individual members of the police force? What an embarrassing state of affairs. We wait with anxiety for the result, and would like in the meantime to have a strict definition of what constitutes female beauty, for our landlord having given us bachelor-lodgers a John as our especial chambermaid, our fine perceptions on the subject have become somewhat blunted.

Tea Adulterations.

[Written for the Min

Statistics show that of all the teas imported into this country from China and Japan, more than two-thirds are of the *green* sort, of which there are various brands and qualities. Few people, however, seem to be aware how poisonous this green article is. So popular is it that the black, and only wholesome variety of tea, is scarcely to be found at any restaurant or hotel in this city, and very little of it is kept on hand by dealers in the article.

In China, the tea for exportation is colored a bluish green by means of a fine powder composed of four parts gypsum to three parts Prussian blue. This coloring matter is sprinkled over the teas during the last five minutes of the process of roasting. The leaves are then stirred about rapidly by the hands of the workman, in order that the color may be equally diffused.

The natives acknowledge that they *never drink dyed teas themselves*, but that as *foreigners seem to prefer* having a mixture of Prussian blue and gypsum with their tea, to make it look uniform and pretty, and as these ingredients are cheap enough, the Chinese have no objection to supplying them, especially as such teas always bring a higher price. Mr. Robert Fortune, in his interesting work, "The Tea Districts of China and India," describes this abominable practice very fully. He found, by careful examination, that to 14¼ lbs. of black tea were applied 8 mace, 2½ candareens, or rather more than 1 oz. of coloring matter. He says: "To every hundred pounds of colored green tea consumed in England or America, the consumer actually drinks more than half a pound of Prussian blue and gypsum. And yet, tell the drinkers of this colored tea that the Chinese eat cats and dogs, and they will hold up their hands in amazement, and pity the poor Celestials."

A good test for such tea is to place a small quantity of it upon a sieve, and pour gently a stream of water upon it; the tinging of the liquid will show to what extent the adulteration has been carried. Gunpowder tea—the black as well as the green—is especially open to this objection, and byson is about as bad. The two former "have a larger admixture of *lye tea*—a compound of sand, dirt, tea-dust, and broken-down portions of other leaves worked together with gum into small nodules."

An analysis of this detestable compound, as given by Mr. Warrington, an English chemist, shows that it contains 45 per cent. of earthy matter. When mixed with black gunpowder, or "scented caper," it is faced with black lead; when with the green variety, Prussian blue; while French chalk and turmeric furnish the required bloom. A great deal of the cheap tea sold in this country is made up here from re-dried tea leaves, together with the leaves of the hawthorn, sloe, and bay, to say nothing of the chapparal.

The moral to be drawn from these facts is plain enough: drink a good quality of *black*, rather than *green* tea, and there will be a marked difference of effect upon your nerves. Your doctor's bill will be much less, and you will no longer wonder what used to keep you awake all night after drinking *just one cup* of that nice-looking green tea. E. R. H.

Removing the Gum from New Silk.—Ammonia is now used by French dyers instead of soap. To a kilogramme of silk they use ten litres of water and from 250 to 500 grains of carbonate of ammonia, according as the silk is white or yellow and hard. The silk is kept in the solution, heated to 80° or 90° Cent., for an hour, and then it is boiled for half an hour. By this treatment silk loses from 22 to 28 per cent. of weight. To finish the process it must be rinsed in a boiling bath containing one or two per cent. of soap, which bath may be used many times over.

How "Watered" Goods are Produced.—Watered goods are first woven plain and then passed between two iron cylinders, one of which is heated; while the other remains at the ordinary temperature of the atmosphere. The tension and abrasion of the surfaces of the goods produces the condition known as "watered."

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

WM. H. MURRAY, California and Nevada.
E. M. DEWEY—California.
S. H. HERRING—California.
J. H. CROSBY—Nevada and Idaho.

Resident Agents.

Perpetual Day.

The midnight of those northern latitudes where the sun does not set, is thus graphically described by ono of a party of adventurers who recently witnessed the scene from a Norwegian cliff: "The ocean stretched away in silent vastness at our feet; the sound of its waves scarcely reached our airy lookout; away in the north, the huge old sun swung low along the horizon, like the slow beat of the pendulum in the tall clock of our grandfather's parlor corner. We all stood silent looking at our watches. When both hands came together at twelve, midnight, the full round orb hung triumphantly above the wave—a bridge of gold running due north spanned the water between us and him. There he shone in silent majesty, which knew so setting. We involuntarily took off our hats; no word was said. Combine, if you can, the most brilliant sunrise and sunset you ever saw, and its beauties will pale before the gorgeous coloring which now lit up ocean, heaveu, and mountain. In half an hour the sun had swung up perceptibly on his heat, the colors changed to those of morning, a fresh breeze rippled over the flood, one songster after another piped up in the grove behind us—we had slid into auother day."

THE value of the gold exported from New Zealand from April 1, 1857, to Juue 3, 1869, was £18,193,289, corresponding to 4,632,490 ozs. The amount produced in the first six months of 1868 was 298,802 ozs.; in the correspouding period of 1868, 320,467 ozs. The number of miners engaged in the gold fields of Victoria is stated to be 69,890; the extent of auriferous ground workcd, 894¾ square miles; and the amount of gold obtained in the six months ending June 30, 1869, 753,833 ozs.

LAYRES' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office, S. F., for $1, post paid.

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

GEO. E. ROGERS,
(Successor to C. W. Bell.)
ASSAYER,
512 California st., San Francisco.
J. A. MARS, Assayer.
Ores carefully Assayed. Gold and Silver Ores worked.

I. O. O. F.
THE NEW AGE,
A WEEKLY JOURNAL OF SIXTEEN PAGES.
The "Official Organ" of the I. O. O. F. on the Pacific Coast.
Is devoted to Odd Fellowsbip, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19vl9

Metallurgy.

MOSHEIMER'S
Pioneer Mining School
— AND —
METALLURGIC WORKS.
ESTABLISHED.....1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to work any kind of ore, or mineral substances.
Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.
I refer not to single persons, but to all tho works which I build in the States of Nevada and California, all of which are in successful operation.
For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 16vl9-3m.

G. W. STRONG,
ASSAYER AND WORKER OF ORES.
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.
14vl5qr.

Trades and Manufactures.

WM. BARTLING. HENRY KIMBALL.
BARTLING & KIMBALL,

PAINE & CO.,
Mine Commission Merchants,
No. 225 BUSH STREET,
SAN FRANCISCO.
Will negotiate the sale of Mines and receive consignments of Ores from Battle Mountain and all parts of the Pacific Coast. They will sell or work the Ores, as the consignors may direct. They guarantee to pay the highest prices for Gold, Silver, Copper, Galena, Lead, Zinc, Antimony and Tin Ores, on the shortest notice. They will make test or working Assays for prospectors at a very low figure. They will also receive orders and furnish Miners' and Farmers' Supplies, including machinery of all kinds, at the lowest prices. N. B.—All correspondence with us will receive prompt attention. 10vl9-3m

WALTHAM WATCHES.
Let every one who wants a Watch, read this carefully
Especially if in some remote out-of-the-way place.
Now that the railroad is open, we propose to give the residents of CALIFORNIA the opportunity of getting single genuine Waltham Watches at the
Lowest New York Wholesale Prices.
We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, postpaid, by return mail. It explains all the different kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it; if not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or
REFUND THE MONEY.
As an indication of the Prices, we will quote one Watch from our list. The P. S. BARTLETT, Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,
$28 in Greenbacks, or about $20 in Coin.
All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,
HOWARD & CO.,
Jewelers and Silversmiths, 619 Broadway, New York.
We refer, by permission, to
Messrs. WELLS, FARGO & Co., N. Y. and San Francisco. I. W. RAYMOND, Esq., T. R. BUTLER, Esq., B. C. HOWARD, Esq., San Francisco.

A Word for Home Inventors.

OAKLAND, CAL., December 1, 1869.

MESSRS. DEWEY & CO.—Gentlemen: Permit us through your paper to return our earnest thanks for the prompt and successful manner in which you have conducted the various matters of business with the Patent Office committed to your care, more especially in securing for us our last valuable patent in the face of so many difficulties. Were it an ordinary case, in which you had simply secured us a patent, and for which services you had received a suitable equivalent, we should hardly consider you entitled to our thanks, however much we might feel gratified with your professional ability, uniform courtesy, or success. But this seems to be an exceptional case, and entitled to peculiar consideration. Without entering here into a detailed account of the legal complications and various discouraging circumstances you were obliged to contend with, suffice it to say, that your almost unhoped for success, securing, as you did, a full patent, despite all these obstacles, in so short a time, was scarcely less surprising than gratifying to us; and we feel it a pleasant duty to offer you this merited testimonial of our appreciation for the valuable services rendered, and to return you our sincere thanks for the same.

In closing, we would say to the public that this is entirely voluntary on our part, as Messrs. Dewey & Co. neither asked it at our hands, nor knew that we intended giving it. It is simply a free-will offering to professional skill and reliability, and a word of friendly counsel to others on this coast who may be possessed of valuable inventions on which they wish to secure patents. To all such our earnest advice is to place them at once in the hands of Dewey & Co., instead of being driven to it by a sad experience like our own.

Yours truly, HUBERT BURGESS,
JAMES STRATTON.

"A SLIGHT COLD," COUGHS,—Few are aware of the importance of checking a Cough or "SLIGHT COLD" in its first stage, that which in the beginning would yield to a mild remedy, if neglected often attacks the lungs. "*Brown's Bronchial Troches*" give sure and almost immediate relief. "*The Troches*" have *proved* their efficacy by a test of many years, and have received testimonials from eminent men who have used them.

BOOK ON EARTHQUAKES.—A Treatise on Earthquake Dangers, Causes and Palliatives, by Prof. Thomas Rowlandson, comprising Earthquake Dynamics, Earthquake Waves, Sound that attends Shocks, Lime, Mortar, etc., Cosmogony and Seismogony, Phenomena of the Neapolitan Earthquake of 1857, and General Observations respecting Structural Arrangements. Published by Dewey & Co., Mining and Scientific Press Office, San Francisco, 1869, containing 96 pages. Price 50 cents, postago free.

C. MULLER, optician, 205 Montgomery, stands first in his profession, and all those who suffer from defective eye-sight should apply to him. *

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

PAIN KILLER, after a thorough trial by innumerable living witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is, that its sales have constantly increased, and wholly upon its own merits. The effect of the Pain Killer upon the patient when taken internally, in case of Cold, Cough, Bowel Complaints, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony as an almost infallible remedy that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. de4

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

[SPECIAL NOTICE.]

Winn's Patent Shampooing Apparatus

By the nso of the apparatus here shown, the unpleasant mode in which the operation of shampooing is nsnally performed, is converted into a neat and tidy process, very effective and decidedly agreeable. By the aid of this apparatus, the head is washed and scrubbed in a bath of water, of any desirable quantity or temperature, and the employment of which, upon the top of the head, is productive of the most delightfully agreeable sensations, such as impart an entirely new feature to the process of shampooing. The apparatus is tasteful as well as substantial in its construction; and its nse is equally as effective when applied to the long, flowing hair, as worn by the ladies, as to the shorter hair of gentlemen's wear.

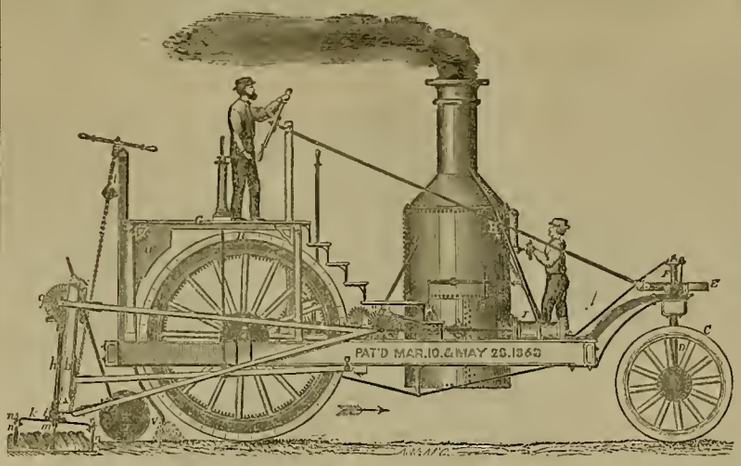
To form this apparatus, a rim or bottomless pan is first constructed, with a gutta percha lining so devised and provided with an elastic strap, as to fit tightly around the head, below the principal part of the hair. The drapery or curtain, which is seen to fall below the rim, is both for ornament and use; it serves to conceal from view the somewhat unsightly straps, lining, etc., which form the water-tight joint between

the head and apparatus thereto applied, and a subsequent elastic gutter, which is strapped tightly about the head, at the extreme lower part of the hair, to catch any water which may possibly escape from the main apparatus. As seen in the engraving, each has a flexible tube appended, by which the water may be carried off to a sink or other suitable receiving vessel, so that the person will have no occasion to leave his seat during the entire operation, or even to remove his neck-tie.

The soap-suds or any other shampooing fluid which may be employed, is poured upon the top of the head, within the rim, after it has been properly adjusted, and a brush or mop, or sponge, or any other suitable instrument, is then employed within the body of the liquid to clean the head and hair. The liquid is readily discharged through a stop-cock and the tube shown in the rear, and fresh water for rinsing applied, as often as may be desirable. Standards, with curved rests or supports, placed upon the shoulders, and adjusted by screws upon the top, all shown in the engraving, are affixed for the purpose of taking the weight of the apparatus and a portion of the weight of the water from the head. The flexible rim which adjusts the apparatus to the head makes this device practicable.

Previous to putting on the rim an elastic strap is placed around the head to hold up the hair intended to be included within the rim, when it may be properly washed and cleansed. This arrangement is particularly useful and indispensable in fact, in shampooing the head of a lady with flowing hair. This combined apparatus renders the process of shampooing as easily and as readily performed for a lady as for a gentleman. Mr. M. L. Winn, of this city, the inventor and patentee, exhibited his apparatus and the practical employment of the process, in the Mechanics' Fair, and will soon open a saloon in this city. The patent was obtained by the M. & S. PRESS PATENT AGENCY.

The Standish Patent California Steam Plow.



Capacity, from FIFTEEN to THIRTY Acres per day. The success of this invention for plowing large fields, is established beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of cultivating their farms, are invited to call upon the inventor, PHILANDER H. STANDISH, or address him by mail, Box 17, San Francisco. Single Machines for sale. Also, State rights, and patents for England, France, and Russia.

$10. $15. $20. $25.

THE CELEBRATED IMITATION GOLD HUNTING WATCHES,

"Collins' Metal" (Improved Oroide).

These justly celebrated Watches have been so thoroughly tested during the last four years, and their reputation for time and as imitations of Gold Watches is so well established as to require no recommendations. Prices—Horizontal Watches, $10, equal in appearance and for time to Gold Watches worth $100; Full-Jeweled Levers, $15, equal to $150 Gold ones; Full-Jeweled Levers, extra fine and superior finish, $20, equal to $200 Gold ones.

We have just commenced making a very fine American Watch, full-jeweled, patent lever, chronometer balance, adjusted to heat, cold and position, 4½ ounces down weight, equal in appearance and for time to a Gold Watch costing $250. We charge only $25 for these magnificent Watches. All our watches in hunting cases, gents' and ladies' sizes, chains, Collins Metal, $2 to $5. Also, all kinds of jewelry, equal to gold, at one-tenth the price.

CALIFORNIA DIAMONDS SET IN GOLD.

We are now making jewelry of the California Diamonds. These are real stones of great brilliancy and hardness, and cannot be distinguished from the genuine stones, even by good judges. They are particularly brilliant at night by artificial light, do not scratch or become dull by use, and retain their brilliancy for an infinite time. The following are the prices:

Ladies' and Gents' Finger Rings, single stones, one carat weight.....$5 each.
Gents' Pins, single stone, according to the size of the stone.....$4 to $6.
Ladies' Cluster Pins.....$7 50.
Ladies' Cluster Earrings.....$7 00.

TO CLUBS.—Where six Watches are ordered at one time, we will send a seventh Watch free. Goods sent by express to be paid for on delivery.

BANDMANN, NIELSEN & CO.,

25v16-3m 210 Front street, San Francisco.

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the MINING AND SCIENTIFIC PRESS. Established in 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

ENGRAVING ON WOOD

DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the MINING AND SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.

F. L. A. PIOCHE.....Proprietor
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*; Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.
Among other things, we manufacture the following:
STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine use.
BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.
Quartz Mill Work,
Including High and Low Mortars, for wet or dry crushing Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.
Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.
Castings of every description, Iron and Brass.
We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.
Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Steam Engines and Boilers constantly on hand and for sale.
We would call particular attention to our
SCOTT & ECKART CUT-OFF ENGINE.
As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:
"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 30-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the travel of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."
Pickering Governors, Machinists' Lathes,
Planers, Shapers, Drills, Etc.
On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.
☞ We are prepared to furnish all kinds of Machinery at short notice, as our facilities are unequalled on the Pacific Coast.
H. J. BOOTH & CO.

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st, between Fremont and Beale, San Francisco.
Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.
Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.
Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.
To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.
Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.
To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

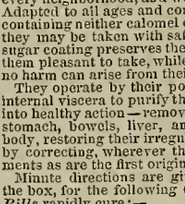
The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
☞ [See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.
8v19-6m

Ayer's Cathartic Pills,
For all the purposes of a Laxative Medicine.



Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.
They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.
Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—
For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.
For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.
For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.
For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.
For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.
For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.
As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.
An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

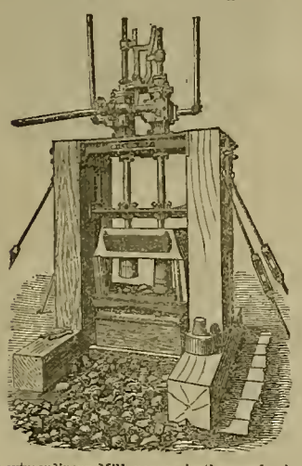
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

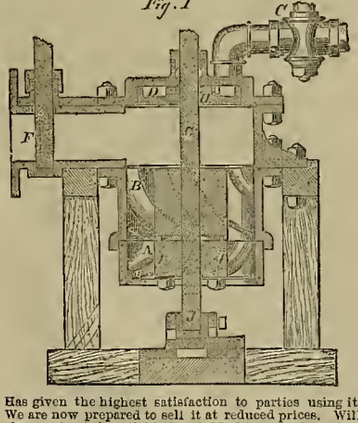
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. B. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

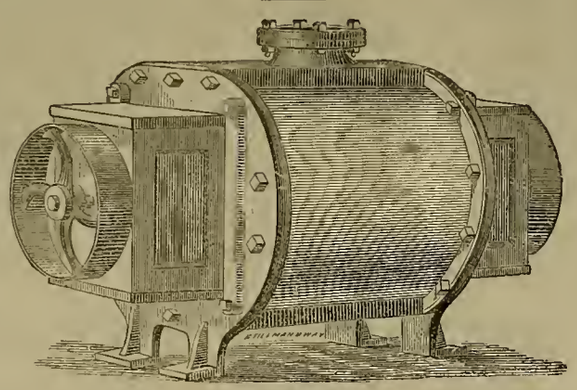
A. LIND, Millwright,
Pacific Iron Works, San Francisco.
Refer to John Sims and J. Haley. 19v19

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

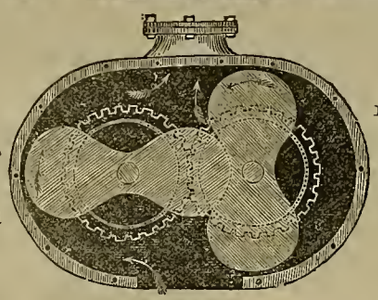
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 31, 1866; and Oct. 6, 1868.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

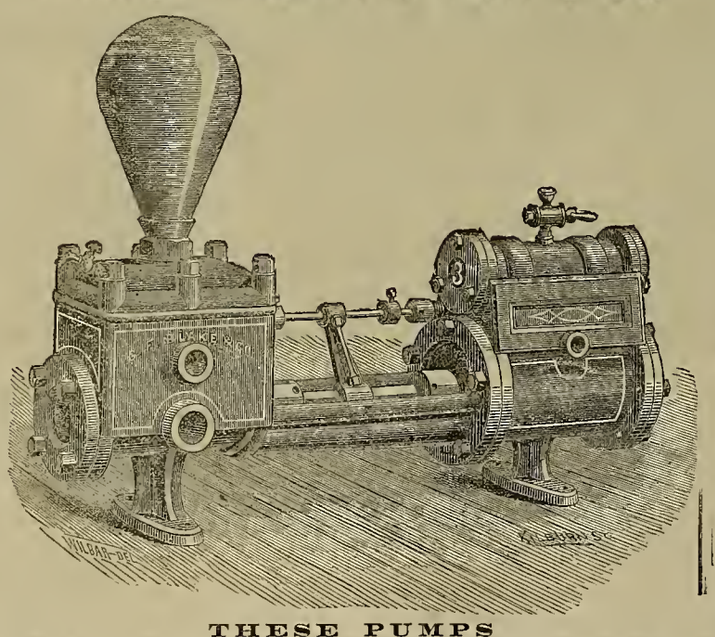
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16-3m **Globe Iron Works, Stockton, Cal.**

BLAKE'S PATENT STEAM PUMP.



THESE PUMPS

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—specially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

IT IS POSITIVE UNDER ANY PRESSURE. *May be run as slow or fast as may be desired.* Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility. Will start at ANY point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having NO DEAD POINTS, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever.

The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes;

IN BREWERIES, TANNERIES, SUGAR HOUSES, FACTORIES, MILLS, LAUNDRIES,

And as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. TWELVE DIFFERENT SIZES are made, capable of throwing from 1,000 to 180,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,
112 and 114 California Street, San Francisco.

☞Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded, 17v19

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

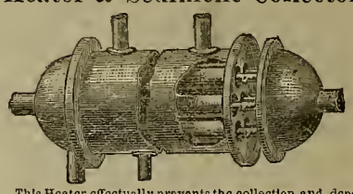
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

SPECIAL NOTICE.

TO DEALERS AND CONSUMERS

—OF THE—

H & L
AXLE GREASE.

Having received your liberal patronage and support during the last fifteen years, and desiring to further extend its consumption, and if possible meet the market of our Chicago friends, we have made a great reduction in prices, and from our long experience we will satisfy you that there is none BETTER, and through your liberal patronage that there is none CHEAPER.

HUCKS & LAMBERT,
144 Natoma Street,

Depot, 320 Jackson Street.

N. B.—We are prepared to furnish Bulk, Packages to contractors on equally liberal terms.

WONDERFUL
Scientific Discovery.
THE GREATEST EVER MADE,

Having Baffled the Ingenuity of Chemists and Physiologists for Ages Past.

DR. CROWLY'S EMERALD HAIR BALM.

NO EXAGGERATION, but a stern reality, verified by the undersigned:

Dear Doctor:—I feel much pleasure to inform you that your "Emerald Hair Balm" has caused the growth of hair on my head—having only used one of your bottles, although I had been bald for twenty-five years. You are quite at liberty to use this intimation as you please. Yours truly, JOHN STAPLETON,
California street, San Francisco.

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harper's Weekly, and is the best printed and most valuable paper on the western half of the continent. All new patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveies, throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

DEWEY & CO.,
U. S. and Foreign Patent Agents.

Woodworth Planers,

PLANERS AND MATCHERS.

With patent expansion, feed gear and other improvements made at Worcester, Mass., in the most finished and substantial manner; also every description of Richardson Meriam & Co's, Smith's and Wood's celebrated

Wood Working Machinery.

Embracing Mortising, Sash and Moulding, Smith's Stickers, Slat and Door Tenoning, Boring, Shaping, Scroll Sawing, Planing, Rod and Dowell making and Re-sawing Machines, Wood and Engine Lathes, etc., for sale at Eastern prices, at the Machinery Depot of
BERRY & PLACE,
112 and 114 California st., San Francisco.
☞ Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free.

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

To Inventors on the Pacific Coast.

Our U. S. and Foreign PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or description in the SCIENTIFIC PRESS. We transact every branch of patent business, and obtain patents in ALL CIVILIZED COUNTRIES.

The large majority of United States and Foreign Patents granted to inventors on the Pacific Coast during the past few years have been obtained through our Agency. Established in 1860, we have an extensive patent library, with full record of cases on this coast, with complete U. S. reports, and can give the best and most reliable advice as to the patentability of new inventions. Advice and illustrated circulars free. Our prices are now as favorable as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

The Illustration of Inventions

In the SCIENTIFIC PRESS is a high recommendation for them, and is the best and cheapest method of bringing them to the notice of the public in a right manner, besides being the most effectual method of selling valuable patent rights and patented articles.

Engraving on Wood

Of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also engraving on metals.

Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. J. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869.—Messrs. A. S. Hallidie & Co., 519 Front street.—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
CALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869.—Messrs A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Garnier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 22 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 18v6-1y16p

The San Francisco Glass Works.

These works, which were erected and conducted under the charge of Mr. C. Neuman, until they were destroyed by fire a little over a year ago, are now about to be rebuilt upon a new site, and under better auspices than were the original works. The old furnace stack and vaults have already been taken down, and whatever was useful of the *debris* left by the conflagration has been gathered together preparatory to removal to the corner of Sixth Avenue and K-streets, near the western end of the second long bridge, in South San Francisco. It is expected that the new works will be ready for starting about the 1st of March.

In the construction of the furnaces all the latest improvements for economy in the use of fuel and other important advantages will be introduced.

The manufacture includes flint and green and black glassware, wine bottles, soda bottles, mustards, druggists' vials, patent medicine bottles, etc.

Large quantities of glassware are used on this coast, and at present most of it is imported. Of all imported articles glass is the most difficult to ship safely, and the loss by breakage is always large. The importation of this ware, when both factories were in operation, was materially reduced, and it is expected that the new works will be of capacity to turn out all that may be ordinarily demanded in this market.

The new works will also be under the management of Mr. Neuman, who is the pioneer and most successful glass manufacturer on the Pacific coast. Some forty or fifty hands will be employed at the start, which number will be gradually increased as the state of the market and success of the enterprise may warrant. Mr. Neuman, it will be recollected, was the recipient of the gold medal at the Fair of the Mechanics' Institute in 1868, and, if we mistake not, he also received a special gold medal from the State Fair at Sacramento for 1867.

MR. W. H. WEBB, of New York, most extensively known as a large ship-builder, and for his connection with almost every steamboat enterprise between the Atlantic and the Pacific coasts, has arrived in this city.

Small's Improved Wood Planer.

Most people agree that the fostering of home manufactures is advisable even if the buyer is subjected thereby to a small sacrifice. At least most agree theoretically, although not always in practice; and it is not difficult to see how the advantage becomes mutual—if not at the present hour, still not many days off.

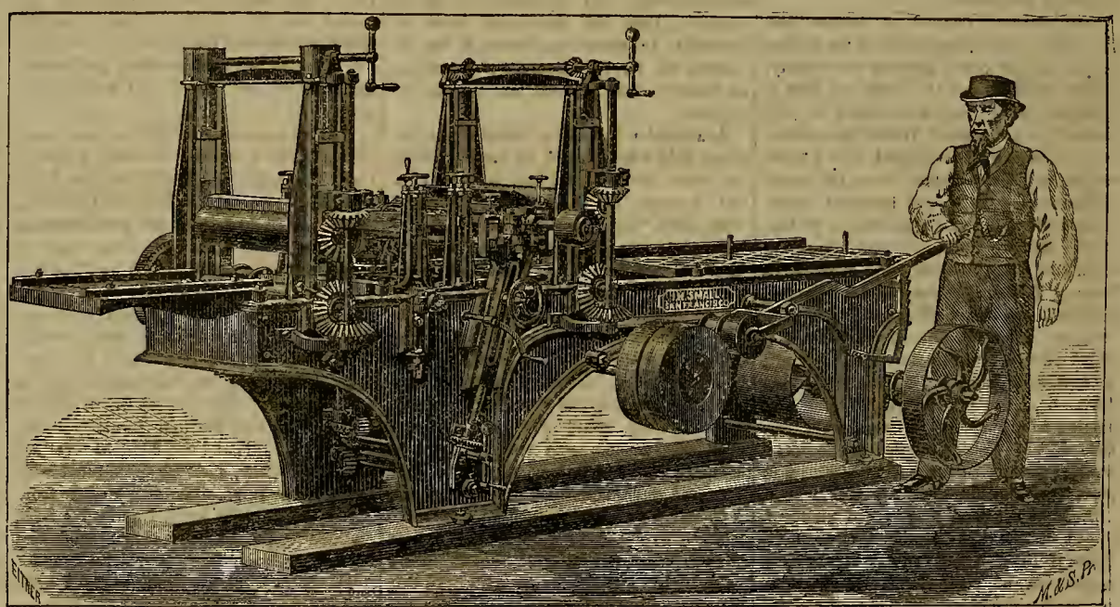
In the way of machinery, the East has long controlled this market. But even in this branch California is making strong headway, although laboring under many temporary disadvantages. As an example of the inventive genius and progressive spirit of our coast, we give this week an engraving of a planing machine made in our city, which has received several decided improvements from an "old Californian." The machine has been in use some time, and it is claimed that several of its modifications have been adopted as far as possible in other planers.

One of the most important of these modifications is the greater expansion of the rolls. By a simple construction, easily understood from the engraving, these can be expanded ten inches, or even more, if necessary; while in other machines six inches, we believe, has been the limit. The use of wrought iron four-sided slotted heads, too, is a very great improvement over the old cast iron heads. There is not so much liability to breakage, and the machine can therefore be run much faster. Moreover, if a bolt is broken, instead of boring and drilling half a day to repair the damage, we need only to slip it out through the slot; to do which requires only a couple of minutes.

The top cutterhead runs up at an angle, instead of perpendicularly; and thus can be raised or lowered any necessary distance without changing the tension of the belt.

The use of a binder pulley on the feed belt prevents the sudden jerking and jarring in starting up, which is so injurious to the gears and other parts.

The bottom box, which holds the upright or tongue and groove shaft, slides up and down by means of a pinion; and in this way the side heads may be dropped. This enables us to use the machine for cutting out mouldings, or for planing lumber from one-fourth inch to ten inches in thickness and from one to twenty-four inches in width.



SMALL'S IMPROVED WOOD PLANER.

The merits of the planer are so obvious that already in a short time quite a large number have been ordered from and sent to various places in this State and in Nevada. They are used by some nine or ten different firms in this city. The one from which the annexed cut was made is now used by Burket & Metcalf, at San José. Such a machine weighs about 7,000 pounds, and costs about $1,200. The prices vary from $400 to $1,700, according to size and quality.

Mr. Small makes the manufacturing and repairing of wood-working machinery a specialty, and seems to be meeting with merited success. There are always advantages to be gained by the purchase of home-made machinery. It is generally better adapted to local work, and contains the best quality of stock. In case of breakage of any of its parts, it can be more quickly and cheaply repaired.

For further particulars address I. H. Small, corner of Market and Beale streets, San Francisco.

SAMPLES of oranges raised in Marysville have been sent East.

RAILROAD PRINTING.—Persons who have noticed the "imprint" on the fancy colored handbills of Eastern railroads, lately posted in the principal cities and towns on this coast, are already aware that Buffalo and Chicago are the places where offices make that class of printing a specialty, and have developed decided skill in the production of novel letters and combinations of colors in the "black art" that proves not so black after all. The railroad printing on this coast seems to center at the office of H. S. Crocker & Co., Nos. 42 and 44 J street, Sacramento. They have just received two (pioneer) presses, especially adapted to fast printing and numbering of tickets (from No. 1 up to thousands) at one operation. The largest press will print, number, and "perforate" a string of coupons some half a yard long, working rapidly, and with seemingly human arithmetical precision. These presses are Hoe's American manufacture, and it is probable there are yet less than a dozen of them in use of the larger variety. Crocker & Co. do a large variety of book and job printing, and possess one of the leading offices in the State.

TRAPPING IN NEVADA.—All along the Humboldt river and its tributaries there exists a fine field for trapping during the winter months. Beaver and muskrat inhabit the different streams above and below Elko in swarms, and can be readily trapped, the skins easily sent to the railroad, where they may either be disposed of at fair rates or sent to the Chicago or San Francisco market.

A FISH-HOOK MACHINE.—There is a machine at New Haven, Conn., which turns out one hundred fish-hooks per minute from a coil of wire.

Communications.

Sketches of El Dorado County.

[Written for the Mining and Scientific Press.]

Editors Press:—El Dorado county being the place where gold was first discovered in quantities to justify mining for it ae a special husiness, after the acquisition of California by the United States, and also one of the pioneer mining counties in growing fruit and wine, a few items in regard to her past and present coudition may be of interest to some of the numerous readers of the Press.

A large portion of the overland emigration of 1849 and '50 enterod California hy the Hope Valley route, which leads directly to this point. Many remained during the winter succeeding their arrival, and commenced their mining operations at or near this town. Some of these are now among the prominent judges, lawyers and merchants of your city, and other large towns of the State. At that time, the place was known hy the appellation of "Hangtown," having received that name on account of snmmary punishment inflicted on three deperadoes in August, 1849, by the miners (Judge Lynch presiding), who attached the trio to a limb of a large oak tree near the center of the town, and there let them remain until they ceased trouhling. The execution of Irish Dick, here, in September, 1850, and two persons taken from the County Jail at Coloma, in 1852, hy the populace, ended the careor of Judge Lynch in thie connty.

The discovery of gold at Coloma (Sutter's Mill) in 1848, was followed by similar discoveries in other parts of the connty, one of which was on the rocks or falle of a stream about oue mile south of this place, hy a man named Weber, the stream or creek taking his name, and also a town, which was located just above the rocks spoken of, having several hundred inhahitants from 1849 to 1854, known as Weberville. But two buildings now remain to mark the spot of that once flourishing bnrg. Weherville contrihuted towards the huilding up of Ringgold, Diamond Springs, Coon Hollow and Placerville, either of which were not over a mile and a half dietant from it. Ringgold is long defunct. Diamond Springs, on the road leading from this city to Sacramento, one mile west of Weberville, had at one time a voting population of more than 900,—now polls less than 150 votes.

Some of the finest grapes and wine produced in the State are in this vicinity. Coon Hollow, which at one time had a population of some 1,500, has hut three or four huildings left, the site of the old town having been washed away by the powerful hydraulic pipe. The Coon Hollow ridge is a spur from what is known as the Hangtown Hill. This hill begins jnst below this city, on the south bank of Hangtown creek, rising to the height of 300 feet or more, swinging around towards the east in a half circle, in which the principal part of the city is located, running east for a number of miles, and dividiog the waters that flow into Hangtown creek from those that fall into Woher Creek on the south.

This hill or ridge for several miles oontains a layer of hlue cement or gravel, several feet in thickness, above the bed-rock, which is more or less intermixed with hoth coarse and fine gold. I saw a solid chunk of eight ounces taken from one claim last year. After the first washing in long sluices, this gravel is run through stamp mills, and the remainder of the gold taken out. Many emall fortunes have been made in these gravel claims, and the possessor has taken hie departure for your city, or some more encouraging place than the mines, to invest his hard-earned money. There are hydraulic claims, quartz mills, a numher of cement mills, tunnel claims, and some few placer and creek claims, which I will endeavor to post you on in future. E. N. S.

Placerville, Dec. 13, 1869.

Mining Mismanagement.

[Written for the Mining and Scientific Press.]

Editors Press:—In addition to the causes that have operated prejudicially to the euccess of mining enterprises in this State, discussed in a former communication to the Press, entitled "Mining *vs.* Stock Johbing," is that of mismanagement uninfluenced hy the nocessities of stock johbers, or other impelling causes aside from sheer incompetency, to use no harsher term, nntil the facts are made patent npon which a different opinion may be fairly predicated. And whether those facts exist, can hest be shown by a brief outline of the management of various mines, particularly in Central Nevada, that have been fostered hy capital from abroad.

Early in 1864, when mining in this State had become a paralyzed industry, with the exception of a few instances in the Comstock, where the wealth of ore was so great and so easily extracted as to successfully withstand the odor of dead "wild cats" and a collapsed stock board, it became ohvious to those interested in the undeveloped and nnworkcd lodes of this section, that capital must be sought in a new direction. Many sales of mining property were readily effected at New York and other Eastern money centers. But not, however, without a spice of the old hreed of Washoe wild cats. The amount of money expended by Eastern companies upon mines in the counties of Nye and Lander duriug the past five years, wonld he difficult to eetimate correctly, aud is immaterial to the question, How has the money been expended? In answering which, a few instances will amply suffice, affording clearly an illustration of the rnle, and not the exception.

At a point a few miles dietant from this place, title was acquired, on most reasonahlo terms, to one of the hest lodes in Central Nevada,—as the sequel will ehow. Very little "dead work" was required—high-grade ores being stoped from the surface. A 20-stamp mill was erected and kept running for a little more than two years; yielding in bullion, as per company's statement, upward of $1,100,000; at the end of which time the company went into insolvency, notwithstanding the entire outlay on mill and mino, with reasonahle economy, could not have exceeded $600,000. In the same vicinity, another company hegan operations about the same time, and under equally favorable auspices. A 30-stamp mill was erected, and the mine partially explored to a depth of 180 feet, at an expense exceeding $1,350,000, as appears by the company's statoment. In this instanee, $500,000 judiciously expended wonld cover the entire outlay.

The managers of another company—the theater of whose operations is almost in view from this place—on their arrival found that the lodes that had been purohased were utterly worthless. Neverthcless, they proceeded to erect a well-appointed 20-stamp mill, and then, for the avowed purpose of obtaining a snpply of ore, in face of the testimony of experienced mining engineers and every practical miner in the district, purchased at a princely price another wild cat. It is hardly necessary to say that the oompany failed. Two or three years ago, there could he seen on Lander Hill, hoisting works costing from ten to twenty-five thousand dollars each, erected, preparatory to any work of exploration, on single lodes a few inches in width, and with a power sufficient to hoist out the entire lode to a depth of a hundred feet at a single draft, where one man with an ordinary windlass was amply sufficient for all present requirements. And numerous companies could be seen actively engaged in the work of development, with a pay roll for "hosses" that exceeded by 100 per cent, that for the workmen employed.

The instances cited are prominent, but exceptional, and, as before said, afford a clear illnstration of the rule. Exceptions are so rare that your correspondent would find it difficult to point to more than one in this connty if required.

Now, both hiters and hitten, managers and stockholders, though obviously from different motives, join in pronouncing mining a failure. Yes, this kind of mining has proved a very great failure, and would be ruinous to every honost stockholder, even if the managers were permitted to drive their levels iuto the vaults of the Bank of England.

If the evils resnlting from this shameful mismanagemeut were confined to the pecuniary losses of stockholders, the consequence would be, comparatively, of little importance. But such is not the case. It has the effect to thwart, hinder and discourage all mining enterprise, whether legitimate or not; to depreciate property of well-ascertained worth, and to hold back indefinitely the essential work of development. Icon.

Ellsworth, Nev., Nov. 23, 1869.

The Eureka Mine, Grass Valley.

[Written for the Mining and Scientific Press.]

Editors Press:—I have had it in contemplation for some time to inspect this wonderfully rich mino. Accordingly, I came to this place a few days since, aud met the foreman, Mr. Gluyas, to whom I made known my husiuess. In a few minutes we were geutly gliding dowu the main shaft, the pumping gear heing in such excellent order that ecarcely a sound conld he heard, so smoothly was the water hrought to the surface from a depth of 530 feet. This shaft has recently been repaired, aud great credit is due to the officers and workmen for the miner-like manner in which the work has heen performed. The timbers are strong, and well put together.

We first iuspected the 300-foot level east. The lode there is from two and a half to three feet wide—a splendid looking lode, standing for several hundred feet in length, and at this point is suppoced to be running to surface. The lode west of the shaft is somewhat larger, averaging from three and a half to four and a half feet wide. After thoroughly examining this level, we began our descent to the 400-foot level, passing through the scveral stopes now in operation. This level has heen driven eaet to within twenty-eight feet of the boundary line, aud most of the lode formerly standing between this aud the 300-foot level has heen taken away, and the space filled with waste dirt. In passing down a winze from this to the 500-foot level, I noticed a large and fine-looking lode standing in each end of said winze, and very productive for gold. This level has heen extended both east and west of the shaft; hut the dietance driven is not far; consequently not much stoping has been done in the hack of said level. I did not see the lode at the hottom of the shaft. The foreman told me it was about two feet wide, and a very good one. The shaft is in course of sinking under the 500-foot level.

The lode throughout the mine appears to he of a uniform character, both in size and quality, and so well managed that it cannot fail to pay for years to come. Should the 500-foot level he driven to the houndary lines, there would be within said lines, at the least calculation, 64,000 tone of available rock. This, at a produce of $18 per ton, would give $1,152,000. Well may the Eureka be called a rich mine. T. Faull.

Union Hill, Nov. 22, 1869.

Sunken Treasure.—Three treasure ships have been sunk at sea within a few months, as follows: The Hamilia Mitchell, with $250,000 on board, in the China Sea; the steamer Carnatic, in the Gulf of Suez, with $245,000, and the Lutine, buried in a sand bank under sixteen fathoms of water, with no lees than $5,000,000. Colonel Gowans, who raised the sunken Russian fleet at Sebastopol, proposes to send divers down to the Lutine next summer.

Gunnery Experiments.—The London *Globe* details some late artillery experiments which showed that in spite of all poseible care in the arrangement,—the exact level of the center of the muzzle of the gun heing taken on the target hy means of a theodolite,—the ehot would strike ten inches ahove it. Theoretically, the ehot would fall hy gravity, and its center should have struck about two inches below the level. The prohable explanation is, that the reccil is sensibly felt before the shot has left tho gnu, and that the resultant of the forces acting on the gun and carriage tends to throw the muzzle up; thus the projectile, although seemingly fired point-hlank, really leaves the gun at an angle. With the 12-pounder breech-loading gun, this angle was found to equal ahout thirty minutes, while with the 9-pounder muzzle-loading Indiau gun it equals only ahout thirteen minutes. The difference is prohahly due to the projcctile taking a longer time to pass through the hore of the breech-loading guu. It may be mentioned that wheu the gun is swung as a pendulum and fired with its axis horizontal, the shot strikes below the level.

The Superiority of American Inventions in Europe.—I suppose that the foreign patents of American inventors that have heen copies of patents previously granted in this conntry are the best that are granted ahroad; and I know that many au English or Freuch inventiou that has heeu patented without difficulty there, has been stopped iu its passage through our office hy a reference of some patent previously grauted in this country, or perhaps iu the very country of its origin. In epite of our examination, which rejects over one-third of all the applications that are made, or, more properly, hecause of it, iuvention has heeu stimulated by the hope of protection; and nearly as many patents will iseue in the Uuited Statee this year as in the whole of Europe put together, including the Britieh Isles. But a few days ago I took up a volume of Italian patents to see what progress the new Kingdom was makiug in inventions, when I was amused aud gratified to find on every page the name of the universal Yankee, re-patenting there his American invention, and, I suspect, much the best customer in the Patent Office of united Italy. The truth is, we are an inventive people.—*Patent Commissioner's Report.*

A Varnish which Dries Quickly. Twelve parts of shellac and four parte of borax are added to 100 parts of water; heat ie carefully applied, while the mixture is continually stirred, and eoon a complete solution is obtained, which is colorless or hrown according to the color of the shellao employed. This eolutiou forms a varnish impermeable to water and uot acted on by the atmosphere. It can be used with oil paints to make them dry quickly hy adding an equal part of tho varnish with a little turpentine to the oil color, and ruhhing them together until a homogeneons fluid mixture is ohtained. This mixture dries in from ten to fifteen minutes, and hence only a small quantity must he prepared at a time.

Match-Makers' Jaws.—The makers of lucifers are eubject to caries of the jawe, which are frequently destroyed by the die-ease. Professor Schoottar is said to have devised a means of depriving the phospho-rus which is the cause of this. By exposing it for some time to a temperature of 47°, this yellow, waxy, transparent suhstance transforms into one which is dark and brick-liko. It may now be packed in boxes without danger of spontaneons com-hustion, ie no longer poisonous, and ie still capable of heiug used for making lucifer matches.

The Southern Phosphate Trade.—The famons beds of phosphate of lime, near Charleston, S. C., are eighteen inches or two feet thick; the phosphate is worth iu Charleston $6 a ton for fertilizing pnr-poses. It is proposed to construct a canal fifty feet wide, three feet deep, and two miles and a quarter long, extending from the phoephate beds to Ashley river, so that the material can be hoated down to the city.

Man Condensed Air.—Liehig says that science has demonstrated that man is formed of condensed air; that he lives on condensed as well as nncondcnsed air, and clothes himself in condensed air; that he prepares his food by means of condensed air, and hy means of the eame agent moves the heavieet weights with the velocity of the wind; in fact, man is wind, and wind is man.

Mechanical Progress.

"Spinning" Metals.

Another way of utilizing the flowing property of metals, which we have often alluded to of late, with extracts from Mr. Anderson's lectures, is the "spinning". The sheet metal, by gentle pressure combined with rapid motion, is caused to "flow" into various forms,—as for instance, hemispherical, oval, or even irregular forms. The process is fast taking the place of the old die-stamping, wherever circumstances will permit. Unlike that process, it does no violence to the metal; sufficient *time* being given by it for the particles to move.

"A very rapid circular motion is given to the sheet of metal, and then by means of an instrument held in the hand, a gentle pressure is brought to bear on one point, thus causing a slight depression; but as the sheet is spinning at high velocity, the depression at once forms a circle, and so by continuing the pressure of the instrument it is molded into any form accordingly. The operation is performed in a species of lathe. A mold of the required form is generally fixed on the end or face-plate of the revolving spindle; the sheet or disk of metal is held by pressure from another headstock against the mold, and by the local pressure of the instrument is formed into the shape of the mold behind it.

The French, who were the originators of the process, employ it with great dexterity in the production of such articles as large oval dish-covers. The sheet is secured to the center of what may be called an oval chuck, and by a dexterous use of two pieces of greased box-wood, the workman cleverly prevents the sheet from puckering as he spins it into an oval, and finally turns over the outer edge into a border, thus giving it rigidity as well as a neat finish."

COAL AND SMOKE CONSUMPTION.—On the Pensylvania Railroad, experiments are now making,—says the Chicago *Railway Review*,—with an apparatus for bituminous coal, invented by J. T. Rich, of Phila., who puts into the fire box a "dead plate," extending from side to side, sloping from a short distance beneath the door, and then turning down perpendicularly to the grate-bars. Above is a fire-brick arch extending from the back well forward, around which the ascending flame must past toward the front. Outside the door is a hopper, constantly supplied with coal, which it passes in, as that already in the fire-box works down to the dead plate. A fire being started in the grate, cokes the coal on the dead plate; and the heat is utilized by passing around the arch and through the flues. As the coke thus made itself burns away—its heat and gases, without smoke, passing through the flues—new coal constantly works down and undergoes the same process. The experiment thus far shows there is no doubt that the process will result in almost entire freedom from smoke; but the practical question whether steam can be made fast enough, is not yet decided.

PHOTOGRAPHING WITHOUT A LENS.—Mr. James Thomson, of Glasgow,—it will be remembered by the readers of the PRESS,—cut thin slices out of the center of fossil corals and ground and polished the specimens until they were sufficiently translucent to be used as negatives from which to take photographic prints upon paper. In connection with Mr. Swan, the patentee of the carbon process, he is now trying experiments upon a plan which they hope will result in the production of blocks from these coral sections which can be used in the common printing press, to print from. So says the *Mechanics' Magazine.*

HEATING SURFACE OF BOILERS.—Recent comparative experiments have shown that 42 feet of boiler surface made 22 pounds of steam from 35·2 pounds of coal; 52·5 feet surface made 220 pounds of steam from 30·75 pounds of coal; 63 feet surface made 220 pounds of steam from 29 pounds of coal; 84 feet surface made 220 pounds of steam from 27·55 pounds of coal; 105 feet surface made 220 pounds of steam from 27·21 pounds of coal.—*Deby's Steam Vade Mecum.*

"SQUIRTING" SOLID METALS.—It is well known that solid lead, and tin, and copper (not to mention wrought iron and steel) may be squirted through a hole by means of a piston under great pressure; and that this property is taken advantage of in various manufactures,—as for instance the making of lead pipes, of the tubes for artists' colors, and the copper casings for patent cartridges. In a recent lecture at the Society of Arts, London, John Anderson, C. E., noted this property of metals and described various processes dependent thereupon. In the course of his remarks he said: "A very singular result was obtained by an attempt to squirt brass pipes, which are extensively used as steam boiler tubes and for gas-fitting purposes. This brass consists of sixty parts of copper and forty parts of zinc, and of various other proportions; but, singular to relate, the pipes so squirted were zinc rather than brass; the most of the copper remained in the vessel and refused to flow. We are not to infer from this that the copper would not flow, but rather that the union between the zinc and the copper was less than the pressure necessary to make the copper flow; the mixture may have been more mechanical than chemical, or the temperature may have been such as to have had the zinc too near its melting point. Whatever is the explanation, the subject is well worth further experiment."

STEEL ENGINE-CRANKS.—Vickers & Co., Sheffield, have cast the second of the two largest steel cranks ever made. Its weight was 38,500 pounds, over seventeen tons. Five hundred and fifty crucibles were poured, in regular order, in making it. Steel castings have shown surprising and uniform cohesive strength and toughness. They are unquestionably free from internal flaws or defects of any kind. A cast steel engine crank, especially of large dimensions, is more likely to be sound (apart from the greater strength of steel *per se*) than a heavy wrought iron forging of the same shape. Even in wrought iron forgings presenting no visible or definite flaw, sections cut out and tested have been found to bear no more than 7,000 or 8,000 lbs. per sq. in. The strength of steel, on the contrary, would not vary much from 70,000 lbs.—a strength attended with great toughness or endurance when exposed to sudden shocks.—*Van Nostrands for December.*

MANUFACTURE OF QUICKSILVER BOTTLES. A circular disk of wrought iron is, by a stamping process, gradually brought into the shape of a cylinder, open at one end, like a glass tumbler. It is then put upon the end of a steel pin or mandrel, and by mechanical pressure, is pushed through a hole, which hole is smaller than its own dimension, thereby reducing its exterior diameter, and at the same time drawing or rather pushing the iron over the mandrel in the same manner as a piece of dough could be drawn over the finger to fit like a glove. This process is repeated through a succession of smaller and smaller holes, one after the other, until at length it becomes a long cylinder. The neck of the bottle is formed by a repeated pressing and twisting at the open end into a conical die, by which means it is gradually brought to the proper form. A screw is afterwards formed for the stopper by the ordinary means.

WATER PROOF FABRICS.—The *Mechanics' Magazine* says that M. Neuman has discovered a way of making cotton or woolen fabrics impermeable to water, which consists in submitting them to the action of strong sulphuric acid for from one to two seconds, according to the nature of the fabric. The fiber is thereby superficially decomposed into a glutinous material. The article is then passed rapidly through water, and then dried over cylinders. The glutinous matter fills the spaces between the threads.

PLUMBAGO AS A LUBRICANT.—Mr. Thos. Shaw found that a planer whose bed-plate required eight men to slide it when lubricated with the best ordinary material, could be easily moved with one hand when good plumbago was used.

Scientific Progress.

Gigantic Fossil Serpent in New Jersey.

Prof. O. C. Marsh describes, in the *American Journal of Science and Arts* for November, a new fossil serpent from the tertiary of New Jersey. We give the opening and concluding paragraphs of the paper:

"The earliest remains of *Ophidia* both in Europe and this country have been found in the Eocene, and nearly all the species from strata older than the Post Pliocene appear to be more or less related to the constricting serpents. Remains of this character are not uncommon in European rocks, but in this country two species only, one founded on a single vertebra, have been described hitherto, and both of these were discovered in the Tertiary greensand of New Jersey. An interesting specimen from the same formation, recently presented to the Museum of Yale College, indicates a third species, much larger than either of the others, in fact superior in size to any known fossil ophidian, and not surpassed by the largest of modern serpents.

This species is represented by a single dorsal vertebra, somewhat injured. * * The vertebra here described would indicate an animal not less than thirty feet in length, probably a sea-serpent allied to the Boas of the present era, In view of its superior size, the species may appropriately be named *Dinophis grandis*. This interesting specimen was found in the Eocene greensand, near Shark river, Monmouth county, New Jersey, and was presented to the Peabody Museum of Yale College by Dr. W. S. Kimball, of Eatontown, in that State. The occurrence of closely related species of large serpents in the same geological formation in Europe and America, just after the total disappearance in each country of *Mosasaurus* and its allies, which show such marked ophidian affinities, is a fact of peculiar interest, in view of the not improbable origin of the former type; and the intermediate forms, which recent discoveries have led paleontologists, familiar with these groups to confidently anticipate, will doubtless at no distant day reward explorations in the proper geological horizon."

SUN NOTES.—Prof. Zöllner, of Leipsic, in a report of his observation upon the August eclipse, a portion of which we find translated and illustrated in the *Journal of the Franklin Institute*, says: "As early as the 27th of June, the first clear day after a long spell of cloudy weather, I observed the bright protuberance-lines. As soon as I approached the slit of the spectroscope to a certain position on the sun's limb, where the lines appeared particularly long and bright, linear flashes passed through the whole length of the dull spectrum *over* the limb of the sun, three or four minutes distant from the latter. These flashes passed over the whole of the spectrum in the field of view, and became so intense at a certain point of the sun's limb as to produce the impression of a series of electrical discharges, rapidly succeeding one another, and passing through the whole of the spectrum in straight lines. This phenomenon can be explained by the hypothesis that small, intensely incandescent bodies moving near the surface of the sun, emit rays of all degrees of refrangibility, and produce flashes of a thread-like spectrum as their image passes before the slit of the spectroscope."

ERICSSON IN A NEW FORM.—M. Delaurier describes, in *Les Mondes*, a method which is proposed for utilizing the sun's heat, for which the author claims many advantages over any use of lenses or mirrors. He proposes to admit the sun's rays into the large opening of a truncated cone open at both ends, and lined with polished silver. The angle of incidence being equal to the angle of reflection, all rays would be united at the small end of the cone. The longer the cone the smaller the opening at that end and the greater the concentration of heat.

STEEL BELTS.—"A friend of ours proposes to use steel belts for certain cases, such as fans. The steel must be welded perfectly, and must be of mild quality, and the pulleys must be large, to make them work well. Steel belts would run with less power than leather, because the power exerted in bending them would be restored when they straightened themselves."—*Artisan.*

Something Besides Chemical Affinity.

At the late meeting of the British Association at Exeter, Prof. Stokes, the President, made use, in his inaugural address, of the following language: "But do the laws of chemical affinity, to which, as I have endeavored to infer, living beings, whether vegetable or animal, are in absolute subjection; together with those of capillary attraction, of diffusion, and so forth, account for the formation of an organic structure, as distinguished from the elaboration of the chemical substances of which it is composed? No more, it seems to me, than the laws of motion account for the union of oxygen and hydrogen to form water, though the ponderable matter so uniting is subject to the laws of motion during the act of union just as well as before and after. In the various processes of crystallization, of precipitation, and so forth, which we witness in dead matter, I cannot see the faintest shadow of an approach to the formation of an organic structure, still less to the wonderful series of changes which are concerned in the growth and perpetuation of even the lowest plant. Admitting to the full as highly probable, though not completely demonstrated, the applicability to living beings of the laws which have been ascertained in reference to dead matter, I feel constrained at the same time, to admit the existence of a mysterious *something* lying beyond—a something *sui generis*, which I regard, not as balancing and suspending the ordinary physical laws, but as working with them and through them to the attainment of a designed end."

DIAMONDS IN OREGON.—Dr. C. F. Chandler recently sent a specimon of ore containing native platinum from Oregon, to Prof. Woehler of the University of Göttingen. A letter from Prof. W. which is given in the American edition of the *Chemical News* for November, informs Prof. Chandler that he finds therein the new mineral composed of sulphide of ruthenium and sulphide of osmium as in the Borneo platinum examined by him some time since, to which mineral he gave the name of Laurite. After detailing the steps of analysis, Prof. W. adds: "On examining under the microscope the mineral powder which had been freed from platinum, gold, chromic iron (in part), silica, iron, and tin, —and from which the ruthenium, etc., had been removed by aqua regia,—besides many grains of chromic iron and beautiful hyacinth crystals, colorless and transparent grains resembling quartz were observed, but besides these, grains resembling rounded diamond crystals were detected. To ascertain whether these crystals were really diamonds, a gram of the powder was ignited in a stream of pure oxygen gas to convert the carbon into carbonic acid. * * * I am satisfied, therefore, that besides the laurite, iridosmine, chromic iron, hyacinth, etc., the Oregon platinum contains microscopic crystals of diamonds."

SILVER IN FOSSILIFEROUS CRETACEOUS DEPOSITS.—A paper by J. P. Kimball in *Silliman's Journal* for Nov., on the geology of Chihuahua, closes thus: "Although the metamorphic Cretaceous is, through the labors of the Geological Survey of California, well known in numerous localities in the Coast Ranges, as a seat of gold deposits, and the Jurassic, east of the High Sierras within the territory of the United States, as a seat of silver deposits, the instances above given of the unequivocal fossiliferous Cretaceous, as well as a probable metamorphic and later zone of the same series, as sources of silver ores, are the first in North America yet reported. The only parallel occurrence yet brought to light, so far as I am aware, is in Chili, where, according to Mr. Rémond, calcareous fossiliferous Cretaceous Strata carry silver deposits, evidently much in the same way as at Santa Eulalia."

ROCK-SALT PRISMS.—At the late meeting of the British Association, C. Brooks, F. R. S., described the method adopted to make prisms of rock salt for spectroscopic use. To prevent the splitting off of the apex of the prism, which repeatedly occurred before it could be ground to a sharp edge, the crystal was finally put in a tin box containing sufficient sand to cover it, and with gradually increasing heat, brought to a high temperature. It was then very slowly cooled. This annealing process furnished crystals which could be ground without splitting.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Tarshish.—*Miner*, Dec. 4th: Fine ore is being taken from the south drift of the upper station. This ore is much nearer the surface than any yet taken from this mine.

Florence.—A report comes to us that the old Florence claim is about to be sold to Eastern capitalists, who will open it up in the spring.

A London Company.—The Exchequer Silver Mining Co. of London, have, through Mr. Chalmers, of the Imperial works here, purchased several parcels of mining property near the heed of Indian creek, and work is soon to be commenced thereon.

M. C. M. Co.—We hear of responsible parties who offer to put up furnaces for this mill in the spring which shall enable it to teke out 85 per cent. of the gold and silver in our ores et less thau half the cost of the old way of roasting. Ample provisions is made by the compeny for funds to cerry out the programme now found necessary.

AMADOR COUNTY.

Kennedy.—*Dispatch*, Dec. 11th: Work on this mine was resumed last Monday, after a suspension of three weeks, since which time they have struck richer rock then has ever been taken out of the mine heretoiore.

CALAVERAS COUNTY.

Coffee Mill.—*Chronicle* 11th: The Golden Gate Mining Co's claim—yclept the Coffee Mill—is worked out. The pumps have been removed and the mine allowed to fill with water. The mine has been worked, with varying success, for a number of years. A valuable engine and battery is connected with the abandoned mine.

Copperopolis.—The San Josquin *Republican* says that James Tullock last spring commenced an eight-foot shaft in the slate near Copperopolie. The result is the discovery of a lode 150 feet wide at the top, and widening down. The ore teken out in the sinking has worked in arastras from $10 to $60 per ton. The ledge hes been located for about four miles, and will be actively worked. Mr. Tullock purposes putting up milling machinery for the reduction of his ore upon an extensive scele.

MARIPOSA COUNTY.

Washington Mine.—*Gazette*, 10th: We are informed that three-fourths of this property, near Hornitos, has been disposed of to parties in San Francisco for $100,000.

INYO COUNTY.

Cerro Gordo.—A Los Angeles telegram of Dec. 15th says: Large shipments of argentiferous galene, from the mines end smelting works of the Cerro Gordo district, ere being received for San Francisco. Nine hundred and eighty-five bars, end upwards of forty-one tons, go by the steamer Pacific to-morrow; the assay gives $300 to $600 silver to the ton.

NEVADA COUNTY.

Idaho Mine.—Grass Valley *Union*, Dec. 6th: The Supt'e report shows the net receipts for the year to be $174,783.04 in coin. Rock crushed, 9,488 tons. Averege yield per ton, $32.50. The main shaft is now down 59 feet below the 500-foot level. Within a week the company will commence sinking a new ehaft, which will be 6½x20 feet, with two cage-ways, a pump shaft and a shaft to eink with. Thie will be located 120 feet east of the shaft now in use. It is proposed to sink the new ehaft 720 feet.

Gold Shipments.—Grass Valley sent to San Francisco, by Wells, Fargo & Co., on Monday and yesterdey, the eum of $38,000 in gold bars. So far this month the shipments have been extraordinary.

Graniteville.—Same of 9th: The Mutual Co. seuds to Findley & Co. a lot of gold, which was made into a bar worth $4,000, the result of three weeks' run with five stamps.

New Machinery.—*Gazette*, 5th: The West Eureka Co. have struck a lead on Worthington'e ranch, supposed to be a continuation of the Eureka. They have incorporated with a nominal capitel of $220,000. They are erecting machinery for pumping and hoisting.

North Bloomfield.—Same of 11th: The Gravel Co. have discharged 150 workmen who have been employed during the summer and fall on the ditch and dam at Bowman's. They will resume work as soon as possible in the spring.

Eureka.—*Transcript*, 9th: The old Jim ledge is lerge and the rock is rich. Black & Young's mill is running upon rock from the mine. Both these claims will be worked through the winter.

Banner Mine.—Seme of 14th: The Benner Co. have struck rock of exceeding richness, and last week a single car load was brought up containing $7,000. The rock is the richest in free gold ever taken from the mine.

The Channel Struck.—The Kansas Co. have succeeded in finding the gravel channel, which runs below the ridge below the Blue Tent roed beyond the east gap of Suger Loaf. Although the works do not yet extend sufficiently to allow us to speak with certainty as to the yield, all the indications show that as a mining euterprise it is unequelled by any other of late years. Many are of the impression that this is on the same channel with the old Nebreska claims. There is a lively demand for mining ground in the viciuity, and holders who could not sell two months ago are now sought by those who are enxious to buy. We understaud thet men with capital stend ready to take hold, and that five or six companies are meking arrangements to go to work.

SHASTA COUNTY.

Mining Items.—*Courier*, Dec. 11th: The Washington Quertz Co., French Gulch, having crushed 146 tons of rock, cleened up this week, and realized about $8,800. ....The Highlend is doing well, and the ledge looks more promising theu ever.... The Honeycomb Co. have 180 tone of rock out ready for crushing.

SIERRA COUNTY.

The Brush Creek Mine.—Grass Velley *Union*, 11th: We yesterday received e letter from J. M. C. Walker, now superintending the works of the Brueh Creek mine, Sierra county, who writes thet the last cleen-up gave $27,500. This was taken out and shipped off et a total cost of $7,500, leaving as profit $20,000. The averege of rock crushed so far has been $42.50 per ton, and the ledge is of the average thickness of six feet. Nick Watson is the owner.

SISKIYOU COUNTY.

Eliza.—Yreka *Union*, 10th: The yield of gold ie en average of $17 to the ton. Lash informs us that his men are at work ou en air shaft to ventilate the lower level.

McAdams Creek.—A gentlemen informs us that the prospects for a good mining season are very favorable.

TRINITY COUNTY.

Quartz.—*Journal*, 11th: Henry Engel hae obtained, near Norfolk, a vein of gold-bearing quartz, which promises not only a large yield, but to he extensive. Several tunnels have been run, and considereble quertz crushed hy an arastra, none of which has returned less than $30 per ton.

Items.—Giant powder is being used on Union Hill, neer Douglas City, with satisfactory resulte....The Indian Creek Fluming Co. sold out this week to a company of Chinese....R. S. Baker end Jere. Long heve etarted into the henk on the west side of Sidney Gulch. They heve expended considerahle labor in putting in a flume.

YUBA COUNTY.

Pennsylvania Mine.—Cor. of *Appeal*, 8th: "To a new company of the right kind of men, this mining property is fully worth the money which has been spent upon it. There is good quartz enough in sight to supply the 16 stamps of the company day and night, without interruption, for months, end perheps years. To judge from the result of the last cleaning up, a monthly yield of at least $10,000 may be fairly expected, the expenses for the same time not being over $3,000. Circumstances will change, and more competent men will be found to develop our resources; only then will it be found that Brown's Valley mines can be worked to advantage."

Smartsville.—A correspondent of the Grass Valley *National* says: "The Hafenegger powder is soon to he tried egain in one of our claims. The late accident was caused by one of the men letting his candle drop into the powder while temping."

Arizona.

Items.—*Miner*, Nov. 27th: C. V. Beseler, from San Francisco, comes here as Supt. for the Sterling....Jas. M. Tiernan, Supt. of the Pinos Altos, is to examine our mines and report upon them....The Vulture mine has procured a cylinder head from Los Angeles.

Silver Mountain.—Thie district is about 50 miles south of Prescott. It was first prospected in 1864. The principal lodes are: The Mammoth, Monterey, Huff and Snow-Ball. The Mammoth crope ont three miles, and, in some places, measures 113 feet in width. The Monterey, in places, is 100 feet thick. Ths Huff end Snow-Ball are not qnits so big. The Hnff is richest in silver, having essayed $640 per ton. Timber is not plenty in the immediate vicinity, but vast forests exist in the mountains, five or six miles to the northward. Water and grass are plenty. The owners are anxious to have their lodes worked, and stand ready to give capitalists a fair show.

Colorado.

Georgetown.—*Miner*, Dec. 2d: The Brown Co., on Sunday, shipped 6,444 ounces of silver bullion, coin value, $8,377.20. This is the product of 22 tons of ore. ....J. Standley sold to Wm. J. Stalker one-half the Stelker and Staudley claim, on the California lode, for $75,000....The reduction works of L. Huepeden & Co. produced, during November, $5,999.95 ounces of silver bullion, coin value, $6,406.32....A well defined lode has been struck in the Helmick tunnel....Pioneer Co's mill, at Montgomery, is running on Personsge ore, with good results. Work is going on in the Excelsior lode, at Buckskin; in Mosquito, the Orphau Boy lode is being worked hy three differsnt companies, and considerahls ore is heing rsised; a new mill is spoken of. The arastras of Newlan and Hostetter have been running steadily all summer with good results. Gulch mining for this season has about cease a ....Slaughter and Wetson have locatedd. tunnel on the north face of Burrell and are working their way into the mountain. The heading has reached 40 feet from the mouth....Several other tunnels are progressing....Mc Namara, Shaw end Hartwell have made a rich strike near Alvarado. An eight-foot sheft shows rich ore. ...Collum's reduction works will commence operations in a few days....The Burleigh tunnel has entered softer rock, and is making rapid progress.

Albro Lode.—One assay of Albro selected ore gave a yield of $411 in silver, end $17,747 in gold, aggregating $18,158 per tou. The average yield of the surface quartz, under arastras, was $200 per cord.

Mendota.—Stewart treated 5,180 pounds of Mendota ore by smelting, which gave a yield of $168.43 in silver, coin value, and 27 per cent. leed, per ton.

Ni-Wot.—The twelve tons of ore now on the dnmp will yield bullion enough to pay a lerge share of the expense of sinking the ehaft.

Par Lode.—An sssay of two samples of average ore, by Prof. Brown, gave a yield of $756.60, and the other, $1,333.80, per ton, and one sample, assayed hy Cherles H. Martine, gave a yield of $721.43 per ton.

Coaley Lode.—Central City *Register*, Dec 2d: H. Goodspeed hes just had a lot of ore run, which yielded an average assey of $650 per ton. He has a vein of ore eight inches thick, which yields $1,099 per ton. He has been sinking a sheft for 60 feet in cep.

Black Hawk.—*Herald*, Dec. 1st: The Black Hawk and the mill adjoining are running 80 stamps on Neveda and Gregory ore—40 ton the latter, 20 on Stalker & Standley's cleim on the California, and 20 on Clark & Co's. Woodbery & Norton's mill keeps 6 stamps on Ophir, 5 on Burroughs and 6 on ore of Winnebego Hill. Ahbot is running 15 stamps at the Sterling mill, in Chese gulch, for Ewers and Dunnegau, on U. P. R. ore. The eame lead keeps 10 stampe employed at the old Hurd mill. The other 10 stamps have been crushing ore from Nevada and from the Hunter lode of Mountain City. M. B. Hays is running 15 stamps at the New York mill.

Briggs Mine.—On Saturday evening last a piece of ore weighing five or six pounds was taken out, which had a vein of almost pure gold running through it. The vein was about an inch wide, and the gold was in the shape of wire making a perfect mat.

Montana.

Items.—Virginia *Times*, Dec. 3d: The Pine Grove and Highland Flume Co. have been engaged all the week in cleaning up. The result is unknown. The How mill is running on the ores of the Polar Star and Nelson. No cleen up has been made. The plates look well. The Louane of Brown's gulch is said to look better than ever in the face of the tunnel. The Pacific Union maintains the place of No. 1, and development shows the Black to he hnt little behind it.

Bannack.—We learn that operations have mostly ceased for the season, outside of prospecting and teking out of dirt for spring washing. But one of the quartz mills of the district is running. Bed-rock has been reached in the main creek, by sinking two feet below the level of the drain, and although the dirt was necessarily taken up in ths wetsr, as high as $6 to the pan has been obtained.

New Discovery.—Helene *Gazette*, Dec. 2d: We are informed that a new gulch was discovered two weeks ago, seven milss east of Reynolds City, twenty miles long. No hig strike has hesn made, but prospects for good wages diggings have been obtsined. The gulch is called "Your Name."

Unionville.—Hendrie's, Hodge's, Addiss', Turnley's and the I. X. L. mill, running ahout 100 stamps, ars pounding continually, night and day, on ore from the Union end Park lodes. The Columbia Mining Co's mill, now heing overhauled by Mr. Tatem, the Supt., will add 30 stamps. Wednesday Mr. Hendris is to build a new 30-stamp mill for Mr. Whitlach.

Virginia.—Nevins and Fair, of Highland, have returned from the Stetes, and again commenced operations on their tunnel. Operations ars almost suspended on Ouly Chance arastras, owing to the scarcity of water. Humhug gulch has failed entirely, and ths arastras are dependent on the stream furnished by the Ballarat tunnel. Prof. Swallow's mill is idle, though furnaces are being erected for roasting silver ores.

Whitlatch, McClure and Argyle Mine. Very rich quartz is coming out now. The mine has been developed to a depth of 260 feet or more, with a large body of uniformly rich ore in sight. This company owns two huudred feet on each side of their shaft.

More Items.—The Parkinson has just struck a fine vein of rich ore....Diamond City mill is running 10 stamps on Park ore. Ten stamps are to be added....Turnley's mill is hard at work....Work on the Park lode is progressing rapidly. There is ore enough in sight to keep the mill at work all winter....The total number of stamps running in the neighhorhood is 124. The new Whitlatch mill will add 30 to this.

Idaho.

Alturas.—*Statesman*, Dec. 9th: Mr. S. B. Dilly, just down from Rocky Bar, reports everything prosperous. Miners all had their winter's supplies laid in; and everybody full of confidence as to the future prospects of the camp.

At the North.—The Grande Ronde *Sentinel* learns of a gold discovery on the divido between the Salmon end Weiser rivers, 40 milee north of Warren'e diggings. It wes discovered last summer, but not prospected until recently. The diggings ere said to he exceedingly rich.

Nevada.

COPE DISTRICT.

Atchison & Drew.—This mill. started up last week, and everything is working in the most satisfectory menuer. They have an abundance of ore on hand, and will soon clean up, when the first shipment of bullion from the district will be made.

Mammoth.—Twenty-six hundred pounds of choice ore from this mine, reached here yesterday, and will be sent below for treatment. Five tons more ere on the road. They are taking out one ton of first-class ore daily and three tons of second-class. The Canty mill has arrived, and will be running inside of 30 deys.

Ores for Milling.—Hendy is on his wey to San Francisco with samples from Pride of the West, Great Republic, Lord Byron, and Black Prince ledges, to he tested by mill process. Assays of the two last-named show $723, and $203 to the ton respectively. Mr. H. goes to arrange for a mill to he crected in the district.

Reports from Railroad and Bald Mountain districts are encouraging.

REESE RIVER.

Lander County.—Daily developments are made in Spring Valley, Sierra, and Secret Valley. During the past week lots of ore from those districts were reduced at the Manhattan mill, the yield of which was fully up to that obtained from the cream of White Pine. One emall lot of 500 pounds, which was sent to the mill as a test, gave at the rate of $2,500 to the ton! Other lots, amounting to several tons each, gave yields of silver varying from $300 to $875 per ton.

Yankee Blade.—This once lively camp is again holding up its head. There is a fair number of men successfnlly working, and some are doing remarkably well.

Troy Mine.—Same of 10th: The lessees have tapped it *in bonanza*. This morning, Mr. J. Moss brought to this office a very fine specimen of the ore, which is a mass of black sulphuret, with here and there ruby. We were informed by him that of a lot sent to the Manhettan mill for reduction the first class yielded $1,114 of silver

to the ton, and second class, $367. The chimney presents the appearance of being permanent.

MINERAL HILL.—Elko *Independent*, Dec. 11th: Work is progressing on the Austin, Gray Eagle, Maggie, Giant, Vallejo and Silver Queen ledges. The ore taken ont has generally, so far, been shippod to Austin for reduction, at a cost of two cents per pound for hauling. Of late some companies have been shipping to the English mill, near Reno, and find it economy to do so. The Confidence mill, in Park Cañon, has been bought by partiee interested, and will immediately be moved. Several otber mills will be erected at an early day.

REVEILLE DISTRICT.—Cor. of the *Empire*, 9th: The Masou & Co. mill—ten stamps—will be running week after next. This mill is 12 miles from here. I am informed that it is a splendid mill, completo in every respect. Howell & Co. are about moving the Harris mill—five stamps—to this district. Taylor Co. & have bought a water privilege, and intend moving the Park Cañon mill here directly. Numerous other mills are projected for the spring. The mines of Reveille are exactly the counterpart of those of Treasure Hill—both as to formation and character of ore. An old claim—the Spy—which was covered by earth and loose material, and on which nothing but assessment work had been done, was uncovered by the owners to the extent of twenty feet in one direction and fifty in another, displaying the richest ore I have ever seen. Horn and native silver can be seen all through it. The lowest estimate I have heard is that it will mill $1,000 per ton.

WASHOE.

HALE & NORCROSS.—*Enterprise*, Dec. 12th: The north drift from cross cut No. 3 is within 45 feet of the northern boundary. The ore is of excellent quality. All of the ore on this level is yielding splendidly at the mills. The winze now being sunk from the fifth level is down 35 feet, and is in very fine ore. They yesterday made the connection between the old and new mines, a work upon which they have been engaged nine months.

OPHIR.—The water is being lowered in the shaft and has settled considerably in the old works. A new tank will be ready to-morrow.

SEGREGATED BELCHER.—A body of ore has been struck on the 500-foot level, which is yielding finely and widening. On the 400-foot level the ore on the east wall is looking well, the car assays showing $40 per ton. The winze on the 230-foot level is down ten feet in fair ore. The mine has been stopped for a day or two, in order to put in a new safety cage. They have on their dump 600 tons of ore.

VIRGINIA CONSOLIDATED.—The shaft is down 470 feet in favorable rock.

BULLION.—They are still drifting north and south on the 1,400-foot level. The ground is perfectly dry and the air good, but hot. No pay ore has yet been cut.

GOULD & CURRY.—The yield from the old upper workings is 50 tons per day, assaying $40 per ton on the average.

IMPERIAL-EMPIRE.—Sinking and drifting still actively prosecuted.

YELLOW JACKET.—Present daily yield, nearly 400 tons, including a large amount of low-grade ore from the old north shaft, which is being shipped on the railroad to Carson river.

CHOLLAR-POTOSI.—From the old works they are taking 160 tons per day. It assays $38 per ton.

OCCIDENTAL.—This mine is yielding the usual amount of ore from the upper levels, and the lower tunnel is being driven in ledge matter in the direction of the pay ore found above.

SIERRA NEVADA.—The machinery of the mill is being overhauled. It will be some three weeks before these repairs will be completed.

SUTRO TUNNEL.—The tunnel is in 299 feet. They made 45 feet during the past week. No change in the character of the ground.

CALEDONIA.—Drifting west from the bottom of the shaft in ore that looks very favorable.

CROWN POINT.—Still drifting in hard porphyry. The east drift is in over 500 feet.

BELCHER.—The body of ore at the 152-foot level continues looking well, and average assays are $45 per ton.

OVERMAN.—Yielding 150 tons of ore per day.

HEAVY BULLION SHIPMENT.—Gold Hill *News*, 7th: Last Saturday evening, there wae shipped from Wells, Fargo & Co's Virginia office, 46 bars of bullion, weigbing 3,818 pounds, and worth $112,113.76. This is the heaviest shipment since last March.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, Dec. 11th: Work goes steadily on in most of the leading minee. The milling capacity of the district is fully employed. The general prospect is entirely satisfactory. Not a day passes that repreeentatives of Eastern men are not here, looking after claims in negotiation for sale.

BULLION.—The shipments for the past 7 daye, from this city and Hamilton, figure up only $59,453.09. The base metal value for the week we could not intolligently compute—perhaps $20,000 to $30,000. Last week the pure metal shipment alone was over $100,000. These shipments will not divide up evenly during the winter. A pleasant week will bring ont large shipments from the bullion roome of the mill. The *Empire* of the 12th eays: Some of the mills having been out of repair, and others not having cleaned up, our bullion shipments for tbe week aggregate but $67,-415.42.

MILLS AND FURNACES.—*News:* The Stanford mill has been idle balf the week, on account of some mishap to the machinery; but is now all right. The Metropolitan is changing from dry to wet crushing. Two new pans, Varney's improved, 1,500 pounds capacity each; and also one large eettler, just received at the Swansea mill, will be in place, ready for service, by Tuesday next. The company designs putting in a new boiler in a short time, and increasing the capacity of the mill to 30 tons per day. *Empire:* The Little Treasure mill is being overhauled and put in order to run through the Winter. A majority of the mills now bave nearly enough ore delivered to supply tbem during the Winter. Large smelting works are to be built at Shermantown by Luther, Thornburg and Rawlings.

ITEMS.—*News:* Ravell shaft is down 20 feet, witb a 20-inch vein of quartz—no metal yet....Aurora Consolidated turns out 40 tons daily of $55 ore....The Earl shaft is down 80 feet.....Aurora South seuds 80 to 100 tons to mill daily....Curry shaft is down 140 feet and has ore....Original Hidden Treasure looks better than ever; ships 15 to 20 tons daily to mill.... Eberhardt yields 20 tons a day from the new chamber, and 10 tons from the Keystone hreast.....Pogonip & Othello yields ore faster than it can be hauled to mill.... Constitution has 125 tons on dump; sends to mill 8 to 10 daily....Imperial ore works $100 per ton....*Empire:* Consolidated Chloride works 100 men and ships 70 tons daily to mill....H. F. Rice drift in 62 feet; good ore all the way....Five tons from the Autumn pit of South Aurora gave $960 at the Stanford mill.

EUREKA.—Cor. of *Empire:* There are two small furnaces at work, occupying but a few men. So far as I know, there are but two or three companies here who propose this winter to increase upon the present reduction works. The *News* says that Col. Buel was to fire up Thursday.

THE LATEST.—A telegram, dated Treasure City, Dec 15th, gives these items: The Chloride Consolidated Co. discharged today 112 men. The Aurora Consolidated have discharged most of their hands, and will stop work shortly. Rumors are plenty as to the cause of the action of the companies, some attributing it to high wages, others to a hearing movement on the part of the stockholders.

The Aurora South is taking out 70 tons of ore daily, and will shortly increase that quantity to 100 tons daily.

New Mexico.

UTE CREEK.—*Telegraph*, Nov. 20th: Messrs. Crawford and McCullom informs us that the new tramway is completed and 35 stamps running. The other 15 not yet arrived. The report of the sale of the Maxwell Grant was again in circulation.

RED RIVER.—We stated, some time ago, that Bartlett & Co. has sent some ore from their mine on Red river to Colorado to be treated. The rock yields by the Swansea process $320 per ton, $175 of which can be saved in a stamp-mill

Oregon.

QUARTZ.—A Portland telegram dated 15th, is as follows: Another quartz district has been struck in Baker county, near the eastern border of the State. Many ledges have been discovered and examined, which indicate remarkable richness in silver.

CIVIL ENGINEERING IN 1831.—When it was proposed in 1831 to build a railroad from East Boston to Salem there was not a civil engineer in Massachusetts of sufficient practical knowledge to make a survey. Lieut. Vinton, of the United States Artillery, stationed at Fort Independence, was detailed for the duty.

Analysis of Morning Star Ore.

An analysie of an average sample of ore taken from the dump of the Morning Star mine, Mogul distriot, Alpine county, Cal., gives the following result:

Gold	0.002
Silver	0.150
Copper	18.050
Iron	30.900
Antimony	6 328
Sulphur	$6.501
Magnesia	1,312
Alumina	0.350
Silica	8 200
Loss	0 207
Total	100 000
Value of silver per ton	$10 04
Value of gold per ton	02 83
Value of gold and silver per ton	$72 87

The lower quality of this ore consists of ordinary copper pyrites of a pale yellow color, both massive and crystallized; while the higher class is distinguished by a very striking and unusual peculiarity in its appearance and the arrangement of its mineral constituents, resembling, somewhat, the kernel-roasted cupriferoue iron pyrites produeed at Agordo in the Venetian Alps and other parts of Europe, by means of a very slow process of roasting, extending over a period of from five to ten months, during whicb the copper (not exceeding one or two per cent. in the crude ore) becomes concentrated into nodules, or kernels, of rich regulus in the ceuter of suoh lump, leaving a shell of gangue and sesquioxide of iron. On breaking open many pieces of this bluish-purple Morning Star ore, we find a kernel of rich vitreous copper regulus, enolosed in a ring or shell of bright yellow pyrites, which is again coated by another concentrio layer of purple copper ore, the whole being enveloped hy a bluish-black, crystalline, antimonial sulpbide of copper.

The mine is considered one of the gems of the district, but has not hitherto been remunerative, in consequence of the difficulties experienced in reducing its ore.

W. T. RICKARD, F. C. S.,
Leviathan Mine, Alpine Co., Cal.

INFORMATION WANTED.—A daughter is anxious to know the whereabouts of her father, Jahez C. Arnold, a forty-niner, who formerly kept store and worked quartz at Middle Bar, on the Mokelumne river; also kept store at Campo Seco, and left Jackson, Cal., about 1863. Supposed to have gone to the State of Nevada. Any person who can give any information regarding him, (address Evans & Askey, Jackson, Cal.,) will confer a lasting favor upon an affectionate daughter. [Newspapers will confer a favor by mentioning above facts.]

COAL MINE DISASTER IN ENGLAND.—At Wigan, on the 17th of Novemher, an explosion occurred which resulted in the death of some twenty-seven miners. As it occurred after the hour of knooking off work, many escaped who otherwise would bave suffered. The whole extent of the damage done had not been ascertained at last accounts.

HON. A. A. SARGENT of California, has introduced a hill into Congress, providing that public lands in California, not mineral or reserved, and unfit for cultivation, but useful for lumber, shall be sold in quantities not exceeding 664 acres, to only one person or association; and no second application to be made under the Act by the same party. Such application not to include any improved or settled lands.

THREE MILES OF CABINET ORGANS.—It is said that Mason & Hamlin have manufactured a sufficient number of cabinet organs to form a continuous row, if placed in close contact, to reach a distance of three miles. Such a fact speake volumes of the growing taste for music among our people.

MOUNTAIN RAILROAD PROJECT.—It is said that the Vallejo Railroad proposes building a branch road from the Oroville Railroad to Timhuctoo, and perhaps to Nevada and Grase Valley.

NEW INCORPORATIONS.—Banning Mining Co. Grass Valley. Dec. 14. Capital stock, $110,000, divided into shares of $100 each. Trustees: J. C. Buckland, R. H. Upton and E. C. Parkhurst.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Dec. 17, 1869.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		*Per ton*
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

HEART-BEATS AND HORSE-POWER.—The work done hy the heating of all the human hearts on the globe is equivalent to the power of 1,046,015 horses. The nominal horse power of the engines in the Great Eastern is 4,000; considering the actual horse power to be 10,000, the power exerted hy the united human-heart beat of the world is sufficient to propel a fleet of 104 Great Easterns at full speed continually. This power could only be generated in average steam engineering practice hy the combustion of 4,680 tons of coal per hour.

IT is stated that the intense cold in St. Petersburg in the winter of 1867, caused solid blocks of tin to crumble and fall to pieces. That this change was due to the intense cold, was proved hy submitting blocks to a low temperature when the same result occurred.

AN important auriferous lode has recently been found about three miles southwest of Tavistock, in Devonshire, England. The ore is stated to be very rich in copper, and to contain some silver and traces of gold.

The PRESS will issue on Friday next, Saturday being Christmas.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

A New Source of Beef Supply.

It is well known that an active and powerful combination of capitalists controls the beef market of this city, and is to-day keeping up the price of that commodity 20 to 30 per cent. above what it would be were it not for this mischievous interference with the natural course of trade. We will not stop here to give the details or evidence of the existence of such a combination; but refer immediately to the welcome announcement that there is a very good prospect of an early release therefrom.

The Sacramento *Bee* of a late date says that a number of beeves lately slaughtered at Promontory and sent in a refrigerator car to San Francisco were offered at twelve and a half cents per pound, and that the beef was superior to the general market supply. Several car loads of live animals have also passed through from the plains to San Francisco.

This fact shows that the California beef market may be affected by the proximity of the Rocky Mountains, now brought so near us by the opening of the Pacific Railroad. Beef has long rated too high in this city, and its quality has been far inferior to what it should be. Heretofore, the profits of cattle raising have been mainly absorbed by non-producing speculators, while the growers have received but little, if anything, over bare living returns. The facilities offered by the railroad, render it very certain that a means is thereby presented for a beef supply quite beyond the reach of interference by San Francisco toll-gatherers, unless they can embrace within their extended arms the entire expanse of our Rocky Mountain pastures. A breaking up of this combination will enable our own growers to deal directly with the butchers, and thus secure to themselves a fair profit, and relieve the consumers from the intolerable burthen of a set of harpies who have fastened themselves upon that important branch of trade. If this Rocky Mountain supply should bring about this desirable reform, it will be a matter of hearty congratulation on the part of our citizens generally.

Currant and Gooseberry Trees.—If you wish to prevent currants and gooseberries from forming suckers, and thus developing into clumps or clusters, and desire to grow them tree form, with a single stalk, take cuttings about eight inches long, in the spring, and cut out all the buds but two on the top, plant about two-thirds their length in good ground, pressing the earth firmly to their entire length; few will fail to grow. They will bear well on and after the second year's growth of wood. The only objection to this method is, if this single stock is damaged by the borer or otherwise, the entire bush is lost; moreover, you decrease the quality of fruit. The best way, however, in practice, is to let each fruit take its natural course and form, a bush. Still when trained to a tree form, the plant is more ornamental and the fruit is larger and finer.

To Keep a Horse on the Trot.—Hiram Woodruff, in his book about trotting horses, says that a pull on both reins will not bring up a horse when he has broken from a trot. A firm, quick pull should be given on one rein, letting the other give a little, as much as you want the horse's head thrown out of line.

Prices of Fruits.—Twenty years ago grapes sold at five cents a pound in Philadelphia; now the same variety commands fifteen. The business of raising choice fruits is not overdone, nor is it likely to be, either east or west.

Selecting Seed Wheat.

The subject of selecting seeds for cultivation has been made a study from time immemorial. Virgil says:

"I've seen the largest seed, though viewed with care,
Degenerate, unless the industrious hand
Did yearly cull the largest."

To insure a good crop of grain, roots, or any other crop, we must plant good, sound seed. In no other way may we expect satisfactory crops. Experiments have shown that if the finest and best samples of seed are annually selected and sown, both the quantity and quality of the product will be improved—even to the establishment of new varieties. All are familiar with the effect of such selection in improving farm stock; the same is true of seeds. If we select and plant or sow "as it comes," we must expect to reap accordingly. A book more ancient than the one quoted above tells us that, "Whatsoever a man soweth, that shall he reap." If he sows tares, he will reap tares; if he sows imporfect seed, he will reap a sickly, imperfect growth.

Interesting Experiments.

We read of an English farmer who, by picking over his seed wheat with the utmost care, and planting a grain in a place, at wide intervals of a foot each way, produced 162 bushels to the acre; when ordinary seed sown in the ordinary way could not have yielded fifty bushels.

At a late meeting of a Kentucky Farmers' Club, Dr. Speer detailed his experience with corn. He had for years instructed his men to select up to a standard sample he gave them—and then himself select the best from that pile. The result was that his neighbors, seeing the extra yield of his crops, came to him for seed, while the distiller paid him an extra price for his corn, because it made more whisky than the imperfect shrivelled corn raised by his neighbors.

How to Select Seed Wheat.

Select the wheat that has made the best growth, and from that portion of the field that has ripened first and filled out the best. Even of that, sow none but the choicest grains *thoroughly cleansed*. No farmer is pardonable in sowing chess, cockle, mustard or any foreign seed with his wheat. Keep the selected wheat by itself, and never place it in large bulk, where it is liable to heat; for the least approach to heating will impair its vitality.

No farmer plants corn without paying some little attention to the selection of the ears for seed. It is a good plan to pursue a similar course in regard to wheat. As it would be too much trouble to examine every head of wheat, in selecting seed for a large crop, let a quantity of the finest and ripest heads be individually selected from the best portion of a field—sufficient to sow ground enough to produce the seed for the next year's crop. From this seed crop select, *every year*, the finest heads for the next year's seed crop. In this way your grain will be greatly improved and your crops increased.

Specific Gravity of Seeds.

From some recent experiments by Professor Church, in England, it appears: First, that seed wheat of the highest specific gravity produces seed wheat of similar quality, and produces the largest amount of dressed grain; secondly, seed wheat of medium specific gravity generally gives the largest number of ears, but the quality of the grain is poorer than that from seed wheat of higher specific gravity; it, however, produces the largest number of fruiting plants; and, thirdly, seed wheat of a less specific gravity than 1.247 is of very little value, yielding only 34.4 pounds of dressed grain for every hundred pounds yielded by seed of the highest specific gravity.

This shows that just in proportion as any sample of seed wheat is heavier than the same measure of pure water, it is in that proportion proferable for sowing purposes. It ought, in all cases, to be at least one-quarter or 25 per cent. heavier than pure water, measure for measure. Light weight in wheat is due to the imperfect formation of the grain—mainly to its deficiency in starch, the principle upon which the starting of the plant depends, as shown below.

The Philosophy of Selecting Good Seed.

All grain seeds are furnished with oil and starch, the use of which in the seed is to provide nutriment for the germ when first it starts, and before it is capable of extracting its food from the soil. Now, if anything affects these properties—this oil and starch—such as mold, etc., the plant will be more or less sickly, and must produce an imperfect seed; and anything which stints a plant just starting, affects its entire after-growth.

It is well known that wheat may sprout and dry up six or seven times, or so long as the spirit-forming material—the starch—is not completely exhausted. So long as a very small portion of this material is left, the seed is still capable of sprouting; but it cannot, if thus measurably exhausted, put forth the required vigor to produce a healthy plant or yield an abundant increase. This sprouting is more or less induced when grain is allowed to heat in a bin or large pile—hence that intended for seed should never be subjected to such a possibility. Moreover, all grain intended for seed should be perfectly ripe, to the end that the starch and all other portions of the seed should be fully and perfectly formed. Old wheat, or that which is two years old, if it has been properly kept, is better for seed than new or the previous year's wheat—experience has shown that it will mature earlier and produce more abundantly.

By careful attention and proper cultivation, as above hinted, the farmer will gradually improve both the quality and quantity of his crops. Similar results will follow a careful selection of tubers or seeds for roots. The proposition, "if it is a root of its kind, it will do for seed," will no more do to stand by than "sowing as it comes."

The Wool Clip of 1868.

The wool clip of California last year was 16,000,000 pounds. Estimating it at 20 cents, would make its total value $3,200,000. Of this total amount of product, only 2,800,000 pounds were worked up in this State. The balance found a market in the Eastern States, where it was manufactured, and a full equivalent in quantity sent here in the shape of woolen goods, at great cost to ourselves and large profit to the manufacturers.

An average of about fifty cents per pound is added to wool in the process of manufacture—full thirty cents of which is for labor alone. Hence, if we add that amount to the 13,200,000 pounds sent away, we have the sum of $6,600,000, which might have been saved to the State by manufacturing our woolen goods at home. Moreover, it is estimated that the total value of our woolen importations for 1868 reached $11,000,000; showing that we still come much short of raising the amount of wool actually consumed in this State. These facts are eminently suggestive of the future possibilities of the wool trade of the Pacific coast.

Hops.—The Willamette *Farmer* says that an enterprising Orogonian, William Wells, of Buena Vista, Polk county, is putting up his hops in half-pound packages, for sale at druggists, groceries, etc. The idea is a good one, as large quantities of the article are sold in small packages, at high prices. This is but one of the many evidences that our people are learning how to prepare their products in such a manner as to take every advantage of the market.

A Farmers' Club in Santa Cruz.

It is only by a union of effort that important works are accomplished. So, to effect any substantial modifications in our systems of education or of labor, we must resort to a multiplicity of devices. If we would improve our modes of farming, there is no *one* thing which will do it. Neither books alone, nor agricultural papers, nor colleges, nor lectures, nor fairs, nor farmers' clubs, can effect the desired reform, however much it is needed. We must bring all of these things to bear. They are all excellent in their way for the dissemination of knowledge, through which alone any important progress can be made in that direction. But we think the value of some of these aids are under estimated, and among that class we would place farmers' clubs. We know of but few ways in which the people of any given agricultural neighborhood can be more profited than by such organizations.

We have been led to these remarks by noticing the efforts made to establish a farmers' club at Santa Cruz. A preliminary meeting was held at the Court House in that town on the 6th of November, which was organized by electing Martin Kinsley, Chairman, and John W. Morgan Secretary, at which a committee of three was appointed to draft a constitution and by-laws and report at a future meeting. The club has since been fully organized, as follows: J. S. Mattison, President; J. Woods, Vice President; John W. Morgan, Secretary; Martin Kinsley, Treasurer.

Some special question will be agreed upon for discussion at each regular meeting; after which, general remarks and suggestions will be in order, much, we presume, after the manner of conducting the farmers' club of the New York Polytechnic Institute. The first regular meeting of the club will be held this evening. Question for discussion: "Which is the most beneficial—deep or shallow plowing?" As the *Sentinel* promises to publish reports of the discussion, we shall watch them with no little interest. We notice that a number of other clubs are already in operation in different parts of the State, from which, we doubt not, much good will come to the farming interests of the Pacific coast.

Castor Beans.—This article will be planted more extensively than usual in California the coming season. The oil works establishment in this city is proving an important stimulant to those branches of agriculture upon which it depends. The castor bean has thus far done well on this coast, and many persons who have heretofore cultivated but little patches as an experiment, are now making preparations to plant several acres—ten or twenty, more or less. The oil works are holding out important inducements for the cultivation of flax, which, it has been found, can be cultivated to a profit for the seed alone. It is held that flax seed at four cents per pound is a more profitable crop than wheat at current rates; while the straw will very near or quite pay the entire expenses of the crop.

Sagebrush Lands Valuable for Agriculture and Grazing.—The *Call* of this city is informed that experience is proving that the sagebrush lands of Nevada are valuable for agriculture and grazing purposes; that a species of the wild sage which grows there in abundance is, during the winter, the finest feed in the world for cattle, being filled with rich seed; that stock thrive wonderfully; that it is the best grazing country on the continent; that the stock brought from there to California is the best in the market; that sheep driven there from California will gain twenty pounds in weight in one season, and that no soil any where produces as fine vegetables as that hitherto despised alkali country. And further, that the little valleys scattered all through the country produce the finest bunch-grass in the world.

Unsown Crops—How are they Produced?

Much has been said, first and last, with regard to the sudden and apparently spontaneous appearance of unsown crops, on a slight change in the condition of the soil—as where a field has been burnt over, or where soil which has long remained undisturbed is turned up by the plow. If we go into the midst of a dense primeval forest, clear up a little space of ground and turn up the soil, without putting in any seeds, we almost invariably witness a prolific growth of some one or two varieties of plants, entirely new to the neighborhood. The same holds true when we turn over, for the first time, the soil of the prairie.

When heath land is plowed, without seeding, the ground is always completely covered with a thick growth of white clover. When an opening in the pine barrens of the South is made, the first crop is invariably a dense growth of a certain weed. In both those cases this is true, even where no such growth has been witnessed, within many miles. Hence the transportation of seed by wind or birds would seem next to impossible. A few scattering plants might be expected; but why such an exclusive growth of plants new to the neighborhood? Why not rather look for plants familiar in the vicinity?

A still more curious fact has recently been noticed on our western plains. At stations on the line of the Pacific Railroad, on vast treeless plains, wherever the station people have fenced in and plowed up the sod, never before disturbed by the hand of man, large quantities of young trees spring up—principally *oak*—although none such, not even a solitary acorn, has been seen within hundreds of miles of such localities.

Do these grasses and weeds and trees spring from their ordinary seed; or are there other germs, of which we know nothing, capable of producing such growths? The closest search for clover seeds on the plowed heath, for the peculiar weeds in the barrens, and for acorns on the plains, as report goes, has never been rewarded with a single instance of success; although in fields sown to make such crops specialties, the seeds are abundantly discernible. The search for the clover seeds upon heath lands has been made a special effort, and never with success.

Whence come the acorns on the distant plains, in such unusual numbers? Travelers certainly do not carry them, and birds cannot. Are we to doubt the reported fact? We have numbers of scientific men, in the capacity of surveyors, engineers, etc., along the road. May the public not look to some of them for a careful investigation into these reported phenomena?

The usually accepted explanation is, that the soil is everywhere full of buried stores of seeds of all descriptions, which await only favorable circumstances of warmth, light and moisture to start them into growth; but common observation and experience teach us that none of the seeds named, and no others connected with this class of phenomena, will retain their vitality for any considerable length of time, unless kept perfectly dry, as was the wheat found in the Egyptian mummies.

The facts noticed are among those mysterious phenomena that have long puzzled scientific men, and which seem to give favor to a certain class of assumptions, the acceptance of which must destroy some of the best established facts connected with scientific research. The greater the number of facts thus far collected in relation to this subject seem to render it all the more inexplicable. Its interest and importance would amply reward a series of observations and experiments.

THE cork tree is cultivated successfully in Eastern North Carolina and in Florida.

The Cracking of Apples and Pears.

The cracking of apples and pears, and the blotches and scarifications frequently observed on their surfaces, have caused much speculation and close examination among pomologists. For a long period the opinion prevailed that such defects were due to a deficiency of certain mineral ingredients in the soil; but the various remedies proposed, based upon that assumption, have been tried, with very little success.

In the course of inquiries in this direction various examples were cited where those fruits sheltered from prevailing winds showed a decided exemption from such faults; and it is now quite generally conceded that cracking and blemishes of nearly every description are the results of fungoid growth—mildew. The atmosphere, and not the soil, is now regarded as at fault. In support of this opinion, the white doyenne, one of the choicest of pears, was cited as rarely succeeding in exposed localities, while when sheltered from the moist winds it is always produced in all its beauty and excellence.

Probably the greater immunity of apples and pears in California from this species of blight is due to our naturally dry atmosphere; and affords additional proof of the correctness of the conclusions of our Eastern pomologists.

How to Fit a Collar to a Horse

The collar is too often quite unfit for the horse. It should not be too big nor too small; but it should be fitted closely, and well padded, with a smooth and plain surface. It is a sin and a shame to compel a horse to draw heavy loads with bleeding and running sores under their collars, and if you will only properly fit the collar to your horse there is no need of such cruelty. The *Harness and Carriage Journal* tells you how to do that thing, as follows: "The plan adopted in the West, and which, we are assured by men who have been long in the collar business, does not injure the collar in the least, is to dip it in water until the leather is thoroughly wet, then put it on the horse, secure the hames firmly, keeping it there until it becomes dry. It is all the better if heavy loads are to be drawn, as that causes the collar to be more evenly fitted to the neck and shoulders. If possible, the collar should be kept on for four or five hours, when it will be perfectly dry and retain the same shape ever afterward, and as it is exactly fitted to the form of the neck, will never produce chafes or sores on the horse's neck."

JOHNSON'S PATENT PORTABLE FENCE.—This recent California invention, which seems to be a practical one for many purposes, is meeting with favor. Mr. R. B. Woodward, who has tested it in his famous pleasure gardens, in this city, writes the inventor in the following words: "I take pleasure in informing you that your patent portable fence gives me perfect satisfaction. I am using it as corrals in my public gardens in this city, and intend using it on my ranch in Napa Valley, as I find it answers my purpose well."

LOSS BY INSECTS.—It is estimated by the *American Entomologist* that, on an average, the United States suffer annually the loss of $300,000,000 from the depredation of insect tribes. From what source it derives data upon which to base these estimates is not stated. They may, however, not be far out of the way, when we consider how vast is the throng of insects which prey upon the vegetation. Locusts, grasshoppers, Hessian flies, cut cotton and army worms, yearly make sad inroads upon the products of the soil. And whoever can invent any appliances for checking the ravages will indeed prove a public benefactor.

A PITCHING MACHINE has been invented in England for the purpose of pitching sheaves of grain into a loft or on to a stack. It is stated that the machine will perform the work of six men. This would be a very useful machine in the large grain fields of this State about harvest time.

Profits of Farming in Stanislaus.

We summarize the following "Immigrant Aid" document from the Tuolumne City *News:*

Grain raising in Stanislaus county is more profitable than in any other portion of the United States. Our people can stand lower prices for grain than other farming sections; in case prices should be reduced to rates much lower than they have been, there would still be a margin for our farmers. Here are our reasons for these assertions: First, our grain-raisers farm without fences, which is a saving of many thousands of dollars. Second, the peculiar soil of our valley—light and sandy—admits of its being plowed at almost any season for about half the price required in other sections. Third, the grain raised, especially wheat, is of a superior quality, by reason of the admirable climate of the valley—free from heavy dews and fogs.

From inquiry, we find the following are the usual prices per acre for cultivating and harvesting: Cost per acre for plowing, $1.25; cost of seed, say 50 cents; for sowing and harvesting, 75 cents; heading this grain and stacking, $1.25. Thus the grain in stack has only cost $3.75. The last crop, a poor one, averaged fifteen bushels per acre. Allow seven cents per bushel for thrashing, and we have an additional $1.05 per acre to add, making in all $4.80. Thus it will be seen that the farmer's fifteen bushels, or 900 pounds of grain, has cost him only $4.80. If the farmer is a practical man, owning his own implements and teams, the greater portion of this cost can be saved, as 300 acres is the amount set apart to be cultivated by each laboring man and team of eight small horses. From these facts we contend that our farmers can live and grow rich at prices which would reduce those in more unfavored localities to want and beggary.

Will Grapes Mix?

A writer in the *Hearth and Home* writes as follows upon the mixing of different varieties of grapes: "Every farmer knows that if two varieties of corn are planted near each other, a mixture will be the result, and it can be distinctly seen the first season. If this be true with corn, it may be asked, why is it not so with grapes? It may be that they will mix, but the mixture is not apparent in what we call the fruit—that is, the pulp surrounding the seed.

Corn is an annual, and grown from the seed each year, while grape-vines are perennial, and not grown from seed, except when new varieties are desired. Suppose we plant a row of sweet-corn by the side of our common field-corn, we will be very likely to find grains of the latter mixed with the former, provided the two sorts bloom at the same time; but the husk that surrounds the ear of the sweet-corn will not show the least mixture; and our Concord grape, which may have been fertilized with pollen from a Delaware, will show no signs of this impregnation; but should we save the seeds and sow them, the plants raised would certainly give evidence of being a mixture of the two sorts.

Two varieties of fruits may grow side by side for all time without mixing; but the offspring of either, if the parents belong to the same species, may be a mixture of the two sorts, provided cross-impregnation actually took place. For all practical purposes, grapes may be said not to mix when grown in close proximity.

WILL BROOM-CORN AND SORGHUM MIX? The *Hearth and Home* answers the above question as follows: "Broom-corn, as well as the different varieties of sorghum, imphee and Guinea corn are now all considered as but varieties of the *Sorghum vulgare*, or Indian millet, the durra or doura of Africa and India. They will all intermix, one with the other, if grown near each other; but will not intermix with the *Zea mays*, or Indian corn—that being of a different genus."

PRESERVING EGGS—THE LATEST "METHOD."—Mr. Violette says that linseed oil, rubbed on the egg, is the simplest and best preservative. Any oily or other substance that will prevent the access of air to the interior of the egg will preserve it for an almost indefinite length of time. It is more than probable that the peculiar properties of linseed oil (boiled, we suppose) will accomplish this end.

Importance of Well-Ventilated Dairy Stables.

Mr. L. B. Arnold assures the *Country Gentleman* that odors inhaled by cows will affect their milk. In June he lost a calf, the carcass of which was placed where northwest winds carried the stench over his pasture. It was soon found that the milk was tainted or pure as the wind changed. The cause being traced and removed, the trouble ceased. In another case, dead horses in the cow pasture caused serious loss to all the patrons of a cheese factory.

This is rather a novel idea, and we should be loth to believe that odors had the power of affecting the milk in a cow in the manner here attributed to it without some further proof than this single instance affords. There can possibly be no more disgusting odors than frequently arise from filthy stables; yet, bad as they may be, and injurious as they no doubt are to the general health of the cattle, we have never before heard of such a direct and immediate injury to the milk therefrom. But as to the milk itself, after it has been drawn from the cow there is no doubt but that it is easily tainted by bad smells. We have known milk to have a taste of turpentine, from the presence of a new pine board near the milk pan in the spring house; and to much care cannot be given to guard against these things by those who would have perfection in the dairy art.

THE CATAWBA GRAPE DISCARDED.—The Catawba seems to be losing favor in the Mississippi Valley. At a late meeting of the Horticultural Society of Alton, Ill., a motion to "wipe out the Catawba grape as a worthless rotten thing" was passed, three to one; but not without sundry emphatic protests by some of the minority members.

TREE PLANTING IN AUSTRALIA.—It is said that no less than 7,523 plants were distributed in one month by the curator of the Botanical-gardens, Geelong, to the various public recipients, making a total for the year of 53,751. Among the applications was one from the engineer-in-chief of railways, for trees to be planted at the Werribee and other stations on the line.

THE PLOW.—It is not known where he who invented the plow was born, or where he died; yet he has effected more for the happiness of the world than the whole race of conquerors who have drenched it with tears and manured it with blood.

THE CORN CROP.—It is believed that the corn crop of the country has fallen off about one-fifth the past year. The crop of 1868 was 800,000,000 bushels.

San Francisco:

Saturday Morning, Dec. 18, 1869.

Notices to Correspondents.

M.—Mining, as distinct from Mining Engineering, must be considered an industrial pursuit, the same as farming; and a miner is a laborer, as is a farm hand. He is not a mechanic, unless incidentally.

M. A. H., Clarksville.—The matter alluded to by you was really a step taken outside of our usual course. It is not the mission of our journal to discuss religious subjects, either seriously or otherwise.

Forty-niner, Placerville.—Your communication will appear next week.

"What are Metals?" by E. P., next week.

California Views and R. R. Scenery. While in Sacramento recently, we visited the photograph gallery of A. A. Hart, an artist who has gained much favorable reputation by his numerous and well executed views of scenery on the C. P. R. R. Mr. Hart's stereoscopic views doubtless exceed in number those of any other artist on this coast. They are very attractive, and show an aptness in the choice of position and location by the artist. The variety of pictures with which his gallery is stored, results from great activity and quickness of perception on the part of the artist, whose works are likely to become widely known and extensively patronized.

New Books.—We have just received from A. Roman & Co. the following books, which we shall notice further soon:

"Useful Information for Railway Men." Compiled for the Ramapo Wheel and Foundry Co., by W. G. Hamilton. Price $2.

"The Polar World: A Popular Description of Man and Nature in the Arctic and Antartic Regions of the Globe." By Dr. G. Hartwig.

Foreign Crop Statistics.—Mr. Sargent has prepared and introduced a bill in Congress to provide for quarterly reports from our Consular agents abroad of the condition and prospects of such crops as come into market competition with our own agricultural products. We are pleased that our Representative has undertaken to get the action of Congress in the matter.

The First California Beet Sugar.

We have frequently alluded to the preparations in progress in Sacramento for the manufacture of beet-root sugar, and are now enabled to state that the first experiment has already been successfully made. On the 10th instant 150 pounds of crystallized sugar was produced at the works, under the direction of Mr. Wadsworth, the amount being decidedly in excess of what was expected from the quantity of syrup employed. The machinery in use was very rude—merely experimental, and designed simply to prove the practicability of the process, and to show the stockholders that there was no difficulty in obtaining a reasonable amount of crystallizable sugar from the juice of California raised beets. The fear has been that the large amount of alkali prevalent in most California soils would seriously interfere with the crystallizable qualities of the syrup produced therefrom. The successful issue of this preliminary trial seems to have settled this point satisfactorily, and we presume adequate machinery will soon be put in operation for the more extensive and perfect manufacture of the beets and resulting syrup before it reaches the point where the refining of ordinary sugar properly commences. The expense of this portion of the machinery is quite small, and the process simple. A revolving cylinder washes the beets, and revolving knives cut them into very thin ribbons, which are macerated for a short time in cold water, for the purpose of extracting their saccharine matter. Lime is then employed to extract the bitter principle, and carbonic acid is afterwards used to precipitate the lime. The after processes of filtering, evaporating in the vacuum pan, straining, crystallizing, etc., is almost or quite identical with those employed in refining cane sugar.

If this establishment should prove a continued success, others will follow in different parts of the State, and it is by no means impossible that the cane sugar refineries in this city may yet find it for their interest to fall back upon beets, for which their present machinery is equally applicable, and thus add largely to the productive resources of the State.

New Mineral Discovery.—We learn from Mr. C. Stott, who recently arrived here from the Yellow Pine district, Nye county, Nevada, in the Mountain Spring range, about 130 miles northeast of Camp Cady, that that region presents a fine and extensive field for mining operations. Mr. S. brought with him 160 pounds of ore, forty pounds of which was worked by Charles Pletz & Co., No. 36 Fremont street, yielding 625 pounds of lead to the ton of ore, and $55 in silver. The ore was taken from the Excelsior mine, which shows a vein of four feet in width on the surface. Mr. Stott, the discoverer of this mine, informs us that wood and water are abundant and convenient to the mine. This is a new district, and the Excelsior is the first company incorporated.

Foundry Work in Sacramento is quite dull at present. Messrs. Williams, Root & Nelson, of the Union Foundry, are making an additional large sized drill for these works, preferring their own make to imported tools. They are also about erecting a new furnace, and making other improvements in the shop. This firm did a lively business last year in steamboat work, mining machinery, iron buildings, repairing agricultural machinery and general job work.

Relief for Mining Counties.—A bill to relieve embarrassed mining counties has been introduced in the Assembly by Mr. Mooney. It appropriates $15,000 from the State Treasury to pay bonds issued for the construction of the Tuolumne and Mono wagon road. It was referred to the Committee on Claims.

A Pacific Coast Triumph—Ogden the Point of Junction.

The fact that the junction of the two Pacific Railroads has been fixed at Ogden is a matter of importance not only to the railroads themselves, but also to the whole Pacific coast. In the contest between the Union and the Central roads, each company had run its grades from Ogden on the east to Humboldt Wells on the west—a distance of some 225 miles. Moreover, the Union laid its track to Promontory, while the Central obtained the bonds up to Ogden. The dispute has been carried on for a long time, the Union Pacific claiming that Promontory, the Central Pacific that Ogden, should be the point of junction. Finally, however, a compromise has been effected, and the Union Pacific has yielded up the fifty-five miles of road between the two places.

This is an immense gain for the Central Pacific Company and for this coast. Promontory is on the top of a high mountain in a desert, where there is no water, nor fuel of any kind. Ogden is in the center of a new valley, where water is plenty, and close to where good coal bed exist. It is the natural distributing point for the vast interior contiaent—southward through the rich valleys of Utah to the Colorado, and northward to Idaho and Montana. The fact that from it radiates the easiest grades for railroads and wagon roads north and south was long known to the Mormons, and the two railroad companies spent over half a million of dollars in surveys, which simply resulted in proving the same truth. Had the Union Company succeeded in holding the fifty-five miles of road between Ogden and Promontory, it would have held the balance of power at the great interior distributing point of the continent, and the Central Company would have been glad to have sold it that portion of its line between Promontory Point and the Truckee river. Having succeeded, however, in securing the disputed territory, the latter company has the vantage ground, and thus assures this coast of a position equal, if not superior, to the Atlantic coast, as a feeder of the manufacturing and other wants of the Great Interior Basin.

Another advantage has been found. Should the Union Pacific road be found liable to serious winter interruption, the Central Pacific can make connection (by means of the line which Brigham Young is now building southward through Utah towards the Colorado) with the main southern Pacific line, when the latter is built, which certainly will be within ten years. So that, while the Central Pacific is on the present great trans-continental highway, it can have a southern connection as well.

These are great and permanent advantages—advantages of the greatest value to the Central Pacific road, but advantages more signal, because more general, for the entire Pacific coast.

The Central Pacific Company intends to stop using the slight trestle work which the Union Pacific Company built on portions of the disputed territory, to improve the road, and lay a double track on the most of it, thus facilitating travel and rendering accidents much less likely to occur.

It now seems certain that Ogden will become one of the leading towns of the interior.

The Regents of the University of California have wisely decided to abolish all admission or tuition fees after the 6th of April, 1870, making the instruction in all department absolutely free to all students, who are to be admitted, if properly qualified, from other states and countries as well as from California.

In our list of members of the Legislature, copied from an exchange, the name of Hon. P. C. Appling, of Fresno county, was misprinted.

The Occurrence of Thenardite in Nevada.

A couple of weeks ago a paragraph was published in all the papers to the effect that twenty-five tons of carbonate of soda had been sent to Virginia City, and that unlimited supplies of the article abounded in the State.

After transporting the substance in question, instead of before, specimens were sent to San Francisco for analysis, and it was found that the article was Thenardite or anhydrous sulphate of soda, a mineral which is at present of no practical utility, and which has not before been known to exist on the coast. We are indebted to Mr. Henry G. Hanks, of this city, for the following description:

The specimen examined was in the form of a crystalline crust, nearly an inch in thickness, remarkably heavy and dense. Luster, vitreous. Color, nearly white, with a slightly bluish tinge. Hardness, 2·5. Translucent. Crystalline faces slightly efflôresced. The mineral blackens slightly in a closed tube, gives a trace of water only, and melts without other change. On platinum foil it fuses quietly, and cools to a white opaque crystalline mass; in the platinum forceps, colors the flame deep yellow.

It is soluble in water without residue. The solution slowly evaporated gives uniform needle crystals to the last mother liquor. The addition of acids to the solution does not cause it to effervesce, nor is there any perceptible change. A heavy white precipitate falls when the aqueous solution is heated with chloride of barium.

A qualitative analysis failed to detect any other base than soda, with a *trace* of magnesia, or any other acid than sulphuric, with a trace of chlorine. The absence of water and of lime distinguishes it from glauber salt and glauberite.

Large quantities of this mineral are said to occur on Walker river, the exact location not being given. The only localities given by Dana are Spain, Bolivia and Peru.

Pictorial Advertising.—Mr. A. A. Hart, photographer, at Sacramento, has adopted a novel mode of advertising by placing large photographs of grand scenery in mammoth frames, containing, besides dial plates indicating the time-table of different railroads, small views and business cards in alternate sections. These frames placed in large saloons are viewed with interest at first sight by all persons, and are constantly being stared at by strangers. Mr. H. contemplates issuing 100 frames, each containing different views. He will soon visit Chicago, and thus place some of his grandest views of California scenery on public exhibition.

The Kentuck Mine Still Burning. A party of miners at work just over the 700-foot level in the Kentuck mine encountered a quantity of carbonic acid gas, on Wednesday last, by which they were badly asphyxiated. Two or three were rendered for a time insensible. The entire party was brought to the surface and were all resuscitated in a few hours.

A New Paper.—We have received the first number of *The Pioneer*, published by the Pioneer Agency, at Helena, Montana, and devoted to "insurance, real estate, and the interests of Montana." The paper presents a remarkably neat and pretty face.

The Pacific Straw Works, No. 535 Bush street, S. F. (mentioned in the Press last week), have ten presses, capable of turning out 200 dozen buckram frames per day.

Real Estate Business in Olympia, W. T., is said to be flourishing, and our friend, Hon. E. L. Smith, late Secretary of that Territory, is recommended by the *Tribune* as the best agent in the field.

Rope Making in California.

THE MATERIALS

Used for ropes are chiefly hemp, the Manila plantain leaf, and a few other vegetable fibers, and flax for lines. The fibers being short, must be overlapped and compressed to form a strong article. The compression is best obtained by twisting, the fibers being drawn out together in the proper quantity to produce a suitable size of yarn; these yarns are put together to form strands, and three or four strands are twisted together to form a rope. These successive steps cause a strain to be more equally diffused than if the fibers were put together at once and twisted, and, moreover, the alternating directions which are given to the twist, cause the different portions to bind on themselves and form a permanently firm bundle.

We propose to take our readers to-day out to the Potrero, and show them what is being done in this line in our city. Allow us first to introduce to you Messrs. Tubbs & Co., the enterprising proprietors of the

SAN FRANCISCO CORDAGE WORKS,

Which we are to visit. (These works were erected in 1856, since which time they have been greatly enlarged.) Mr. W. L. Spinney, gentlemen, superintendent of the factory, and Mr. W. Anderson, engineer, under whose supervision the fine Corliss engine, which supplies all the motive power, was set up. It being Saturday, Mr. Spinney is very busy, but Mr. Anderson will show us what is being done. We go first to the

DRAWING AND SPINNING DEPARTMENT,

Where we see the bales of "Manila" just imported and landed at the company's wharf. This Manila is the fiber obtained from the leaves of a species of wild plantain which grows in the Spice and Phillippine Islands in great abundance, and is not, therefore, a true hemp. The hanks, you observe, are cut to a proper length, moistened with oil and weighed in batches of five to eight pounds, according to the size of the machine—the "lapper"—to which it goes first. A batch is fed into rollers and passed into the lapper, which revolves a moment and then is stopped, and which, as the workman removes the hemp, appears to be a wheel of some six feet in diameter, with its circumference thickly studded with long steel teeth. These, as the wheel has revolved, have straightened out the fibers of the raw material and drawn it out into a "lap" some eighteen feet long. The lap is passed through the machine once more, and then goes to the "drawing frame." If you are mathematically inclined, you will have observed that there are eight lappers, and will have found, by inquiring, that some thirty-five bales of hemp, averaging 275 pounds apiece in weight, are worked up daily.

The *first* drawing frame is called a "splicer," and to the uninitiated eye looks like the others. The machine consists essentially of, 1st, a pair of feeding rollers; 2d, a long endless apron made up of horizontal slats fastened on to bands, which revolve over rollers placed at the two ends of the machine, each slat being provided with a row of long teeth which catch the hemp and pass it on to, 3d, the fluted discharging-rollers. The last revolve *more rapidly* than the apron, and, therefore, draw out the fiber through the apron-teeth into a narrow band. The man who feeds lays one end of a "lap" over that of the preceding, and thus we obtain from the discharging-rollers one long band of fibers, combed and straightened out, which is discharged continuously into cans. Several of these bands of "roping" are fed together into another "drawer," and drawn out still longer, and then passed to a third machine. The result, then, of the lapping and drawing is, that our original bundles of hemp are now thoroughly combed and straightened into one continuous "roping" of a proper size to be spun into "yarns."

The spinners, or "jennies," are similar to those used in cotton mills, and are of too complicated mechanism to be described here. They take the ropings and twist them loosely into "yarns," at the same time winding the yarns upon bobbins. The bobbins are slid through an inclined trough into the

ROPE WALK,

Where they are placed upon upright spindles, arranged upon a frame-work in such a manner that any number of yarns may be drawn off and twisted into a "ready" or strand. We presume that you have previously visited rope walks, and are generally acquainted with the complicated machines used. Suffice it, then, to call your attention to the way in which several yarns from the bobbin-frame are passed through the holes in this steel disk, thence through the bore of a fixed steel tube, the size of the bore regulating the size of the strand, and then fastened to a hook of this hauling machine. As the machine retires slowly down the walk, the hook revolves around the axis of its shank, and thus the yarns are twisted to a "ready."

The readies being cut into the proper lengths for the rope to be made, are laid upon cranes placed at intervals along the length of the walk. At one end they are attached to the revolving hooks of a machine which twist or "harden" each ready. At the other end three or four readies pass through deep grooves cut into the "top," a conical wooden block attached to a movable car,—the "top-sledge,—and then are fastened to a "laying machine" which revolves in an opposite direction. A so-called "tail-rope" is fastened at one end to the top sledge, and wound around the rope-to-be, just behind the top, while the other end is held by the rope-layer, who walks behind the car. The readies having been sufficiently "hardened," the laying machine is revolved, and thus the sledge is forced up the walk, its speed, and, therefore, the tightness with which the rope is wound, being regulated by the force with which the rope-layer holds the tail-rope. This tail-rope, then, acts similarly to the tube placed near the steel disks in making the readies. The finished rope is rolled into coils, tied up, and is ready for the market.

In the spinning department there are several "stationary laying machines," which, in one operation, spin the ropings into yarns, twist the yarns into readies, and lay the readies into ropes. But the article thus manufactured is not so strong and durable as that which comes from the rope walk.

At this establishment all sizes of ropes are made, and the walk being 1,500 feet long, this length of rope can be obtained. Most of the cordage manufactured is for mining and agricultural purposes. We understand that there is an order for hoisting rope of a length of 2,000 feet for Hayward's mine. Some sixty-five men are employed, who work, however, only during the day. The capacity of the mill, which now turns out a couple of million pounds of rope annually, can therefore be doubled by having a night shift.

Thanks, gentlemen, for your kindness in showing us your works. When we locate our mine or build our ship, we shall know where to obtain our cordage, and if the cares of life press too heavily on us, and we determine to "suspend" ourselves, we shall apply to you for a rope of the requisite strength.

KELSEY'S NURSERIES.—We have received the proof sheets of a descriptive catalogue of Kelsey's Nurseries, Oakland, which gives a very extensive list of fruit trees, vines, plants, ornamental trees, shrubs, roses, flowering plants, etc., together with some hints as to the culture and treatment of the same.

Pacific Coast Inventions.

New Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR THE WEEK ENDING DECEMBER 7TH.

WIND WHEEL.—Leonard Fischer, Sonora, Cal.

GANG PLOW.—Dennis Henry Gleeson, San Leandro, Cal., assignor to himself and Dennis Gannon, same place.

TUCK-CREASER FOR SEWING MACHINE.—John H. Mooney, San Francisco.

SEAT FOR CHAIRS, SOFAS, ETC.—Frederick Wittram, San Francisco.

MACHINE FOR JOINTING STAVES.—Lamartine R. Fulda and Martin Fulda, San Francisco.

FASTENING FOR NECKTIE.—Harry M. Heiueman, San Francisco.

WATER CLOSET.—John B. Hobson and John Middleton, Jr., San Francisco.

GANG PLOW.—Byron Jennings, Gilroy, Cal., assignor to himself and Henry W. Briggs, same place. Antedated Dec. 1. 1869.

WATER WHEEL.—Henry P. McCleave, Tomales, Cal.

FLEXIBLE PIPE COUPLING.—Quartus Rice, Nevada, Cal.

HORSE HAY RAKE.—William Sharkey, Chico, Cal.

HANGING WINDOW SHADES.—John I. Tay, Oakland, Cal.

MEANS FOR HANGING WINDOW SHADES.—John I. Tay and Lodowick L. Sawyer, Oakland, Cal.

PEN.—Addison G. Waterhouse, San Francisco. Antedated November 25, 1869.

Recent Patents.

MACHINE FOR JOINTING STAVES.—L. R. and Martin Fulda.—By the use of this machine the staves of barrels, tanks and casks of all sizes can be given the proper bilge and bevel on one or both sides at once, and with or without bending. This is particularly useful for very large work where the staves are very thick and cannot be bent without steaming. The machine consists of two saws, planes or other cutters, mounted on carriages opposite to each other, and moving back and forward transversely to the motion of the stave and its carriage. These cutters stand at a variable angle to the stave and to each other, and in moving back or forward their carriages also move in a corresponding curve, so that the bevel of either wide or narrow staves will lie in radial planes of the proposed cask. The stave carriages descend each way from the center, thus giving the stave the proper shape, while the angle of the cutters gives the proper bevel. The inventors are practical coopers and well-known business men in that line.

HORSE HAY RAKE.—William Sharkey, Chico, Cal.—This invention relates to revolving rakes attached to sulkies or other vehicles, and consists in constructing the frame of the sulky or wheeled vehicle of sufficient length to allow the rake to be worked between the wheels and the horse, and in attaching the rake to the frame of the vehicle in such a manner that it can be easily worked in the above-named position. A device is also attached, which is operated by the foot of the driver, and by which the teeth of the rake may be raised so as to pass over any uncut or fouled grass which may be in the way. The rake being before the wheels, enables the driver to see and control its working. It is simple in construction, and being made almost entirely of straight timber, any part can easily be replaced.

IMPROVED WINDMILL.—William I. Tustin, San Francisco, Cal. This invention consists in constructing the wheel which carries the vanes and the rudder in two separate parts and uniting them together by a suitable turn-table, so that the wheel can be turned about to stand at any required angle to the rudder so as to regulate the speed by causing the wind to strike the rails or vanes in the direction or at the angle requisite for producing the desired speed. It also consists of a device which is attached to the lower end of the vertical shaft which supports the wheel. This device is connected with the turn-table by a rod, by means of which the wheel may be turned to any angle required by means of cords, within easy reach of a person standing upon the ground.

GANG PLOW.—This invention consists in an improved manner of operating the plow frame, in order to raise it and clear the plows from the ground, and also in the manner of attaching the frame to the trucks, so that the operation of raising and lowering the frame is simplified, and the amount of power required is reduced. Mr. Jennings is residing at San José at present, where he may be addressed for further information.

WIND WHEEL.—Henry P. McCleave, Tomales, Cal.—By the triangular form of the vanes, and by bending one of the outer corners of each vane down towards the center, where the third corner is secured, the efficiency of the wheel is much increased—being more simple and stronger than the ordinary wheel.

MEANS FOR HANGING WINDOW SHADES. John I. Tay and L. L. Sawyer, Oakland, Cal.—This is an arrangement for lowering the shade from the top or elevating it from the bottom, so as to have it in any desired position—the whole presenting a neat and tasteful device.

HANGING WINDOW SHADES.—John I. Tay, Oakland, Cal.—An improvement on a former device which has been previously noticed and illustrated in the PRESS.

New Rotary Steam Engine.

The Nevada *Transcript* gives the following description of a new California invention: "We saw yesterday, at Stiles' mill, the newly-invented steam wheel or engine of Parkinson & Fisher. It is the most compact and complete thing in its construction we have ever seen, and is so simple that it may be taken apart and put together in fifteen minutes. The entire thing is about the shape of a cheese box, and is only thirteen inches in diameter and four inches in width. Inside of this is a close-fitting wheel ten inches in diameter, on the outer circumference of which are three sliding valves, equi-distant from each other. The space between this wheel and the outer shell is occupied one-third by a steam chamber, one-third by an exhaust space, and in passing upon the last third in a circular inclined plane. The latter closes the valve as it comes opposite the pipe where the steam is let in. At this point the steam passes through a hole under the valve, forcing it out, and the full force of the steam is applied, until another valve is brought under the pipe, where it is in turn forced out, and the steam in front of it passes out to the exhaust pipe. From this latter part the incline gradually presses the valve until it is flush with the periphery of the wheel, where it is again forced out to do its work. The wheel runs with great rapidity and has immense power, while the friction is much less than in an ordinary engine. This little wheel is running two lathes and other machinery in the shop, besides furnishing power for turning the cylinder of a steam engine. The tests, so far, have given general satisfaction; but it has been found that steel must be substituted for cast iron for the valves. This has already been done, and the engine may be seen at work at the mill of W. C. Stiles. Machinists who have examined it are confident that it will answer the purpose for which it is intended. The machine may be used either with steam or water power."

RAILROAD LANDS.—In the House of Representatives a resolution has been passed directing the Secretary of the Interior to suspend the order opening the lands reserved for the Southern Pacific Railroad to private entry until further legislation by Congress. The object of the resolution was to guard against further land-grabbing on a large scale.

AUSTRIAN EMIGRATION, which, until recently, has generally found its way to Brazil, is now being directed into the northern portion of the Southern States. A large company has recently located in Henrico county, Virginia, where they will occupy a territory by themselves. They bring with them their own mechanics, and a priest to look after the religions interests of the colony. It is said that these emigrants are greatly delighted with the climate and soil of the country, and that we may eventually look for millions of that class of emigrants from Australia, Italy and Spain.

ROAD STEAMERS IN PARIS.—One of Thomson's road steamers has been for some days,—says *Engineering* for Nov. 19th,—running through the streets of Paris, dragging a heavy omnibus, with fifty passengers. The Government has granted permission to run over two routes, one of which includes some of the busy parts of the city. The engineers declare it more manageable than horses, and safer for the public. The rubber tires save both machinery and roadway. The speed is that of a fast omnibus.

ORIGIN OF THE BANKS OF NEWFOUNDLAND.—It is said that the Grand Banks of Newfoundland owe their origin to the detritus which is brought down from the polar continents upon the ice fields which make their way through Davis Straits into the warm current of the Gulf Stream, where they become disintegrated and drop their loads into the ocean. If the Atlantic Ocean should be dried up, these banks would present a huge mountain of gravel as high above its eastern valley as Mount Blanc is above the plains which surround it.

TO REMOVE THE TASTE OF NEW WOOD. A new keg, churn, bucket, or other wooden vessel, will generally communicate a disagreeable taste to anything that is put into it. To prevent this inconvenience, first scald the vessel well with boiling water, letting the water remain in it till cold. Then dissolve some pearlash or soda in lukewarm water, adding a little lime to it, and wash the inside of the vessel well with this solution. Afterwards scald it well with plain hot water, and rinse it with cold water before you use it.

PRODUCTS OF THE VINE.—Distilleries, small and large, running mostly upon this year's grape yield, are shipping little to San Francisco just now. The demand for home consumption and points in the interior is constantly increasing. Los Angeles wine shipped to New York is competing successfully with foreign products. Favorable legislation will wonderfully advance such interests, and help the development of the latent resources of our whole wine-producing region.

IT is the law in Japan that no fir or cypress tree can be cut down without the permission of a magistrate, and for every full-grown tree that is felled a sapling must be planted.

GEO. E. ROGERS,
(Successor to G. W. Bell.)
ASSAYER,
512 California st., San Francisco.
J. A. MARS, Assayer.
Ores carefully Assayed. Gold and Silver Ores worked.

17v17-qy12p E. P. HEALD, San Francisco.

I. O. O. F.
THE NEW AGE,
A WEEKLY JOURNAL OF SIXTEEN PAGES.
The "Official Organ" of the I. O. O. F. on the Pacific Coast.
Is devoted to Odd Fellowship, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19v19

Metallurgy.

MOSHEIMER'S
Pioneer Mining School
—AND—
METALLURGIC WORKS.
ESTABLISHED.....1858.
Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to work any kind of ore, or mineral substances.
Special attention I would call to all parties who have the so-called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.
I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.
For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2095 Powell street, San Francisco. 16v19-3m.

G. W. STRONG,
ASSAYER AND WORKER OF ORES.
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.
14v15qr.

H. W. GRAY. J. ROSEBERRY. D. S. LOOMIS.
Ores of all Kinds Crushed and Sampled.
H. W. GRAY & CO.,
YOLO MILLS.
Corner Market and Beale Sts., San Francisco.

PAINE & CO.,
Mine Commission Merchants,
No. 225 BUSH STREET,
SAN FRANCISCO.
Will negotiate the sale of Mines and receive consignments of Ores from Battle Mountain and all parts of the Pacific Coast. They will sell or work the Ores, as the consignors may direct. They guarantee to pay the highest prices for Gold, Silver, Copper, Galena, Lead, Zinc, Antimony and Tin Ores, on the shortest notice. They will make test or working Assays for prospectors at a very low figure. They will also receive orders and furnish Miners' and Farmers' supplies, including machinery of all kinds, at the lowest prices. N. B.—All correspondence will us will receive prompt attention. 10v19-3m

WALTHAM WATCHES.
Let every one who wants a Watch, read this carefully
Especially if in some remote out-of-the-way place.
Now that the railroad is open, we propose to give the residents of California the opportunity of getting single genuine Waltham Watches at the
Lowest New York Wholesale Prices.
We sell more Waltham Watches than any other establishment in the country, either wholesale or retail; we send great numbers to every section of the country by Mail and Express, carefully packed, and in perfect running order. Our plan is this: You want a Watch, and see our advertisement; now, we want you first to write to us for our Descriptive and Illustrated Price List; we will send it, post paid, by return mail. It explains all the different Kinds, tells the weight and quality of the cases, with prices of each; you then make a selection of the kind you prefer, and send us your order. We will then send you the Watch by Express, with the bill to collect on delivery. We give instructions to the Express Company to allow you to open the package and examine the Watch; if it suits, you can pay, and take it. If not, you are under no obligation to receive it; and if it is taken, and afterwards does not prove satisfactory, we will exchange it, or
REFUND THE MONEY.
As an indication of the Prices, we will quote one Watch from our list. The P. S. BARTLETT, Lever Movement, with Extra Jewels, Chronometer Balance, Patent Pinion, Patent Dust Cap, and all the other late improvements, in a Solid Coin Silver Case,
$28 in Greenbacks, or about $20 in Coin;
All the other kinds, both gold and silver, in the same proportion. Do not order a Watch till you have sent for a Price List, as it contains a great deal of information regarding these Watches that will enable you to make an intelligent selection. Don't forget, when you write, to state that you saw this advertisement in the MINING AND SCIENTIFIC PRESS, and you need not put in stamps for return postage. Address in full,

Oil Cake Meal.

THE BEST FEED KNOWN

For Live Stock.

We desire to call attention to OIL CAKE MEAL, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal; and in the U. S. Government Report of the Department of Agriculture for 1865 it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz.: Indian Corn Meal, 11 pr. ct.; Barley Meal, 13 pr. ct.; Oat Meal, 18 pr. ct.; Oil Cake Meal, 22 2-100 pr. ct. For life-sustaining properties for all stock exposed to sudden changes of weather or over-driving it has no equal.

FOR MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any other feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other food; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It will improve it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy and of much finer quality than when fattened on any other feed; and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness, evenness and glossiness of the hair.

FOR SHEEP there is no article of feed known that produces such fine mutton or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price ($28 per ton) it is the cheapest feed in market. It is now selling in New York at $42 per ton, gold; at $50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this meal from those on this coast by whom it has been thoroughly tested has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed dealers, and at the manufactory, King street, near Third All orders will receive prompt attention. Address—

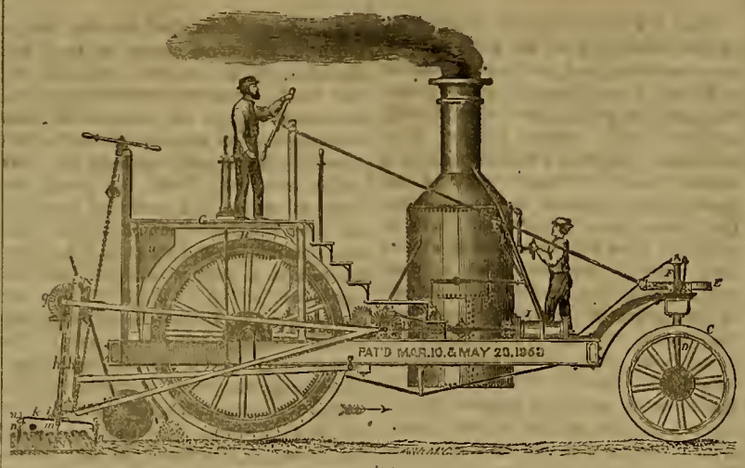
The Standish Patent California Steam Plow.



Capacity, from FIFTEEN to THIRTY Acres per day. The success of this invention for plowing large fields, is established beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of cultivating their farms, are invited to call upon the inventor, PHILANDER H. STANDISH, or address him by mail, Box 17, San Francisco. Single Machines for sale. Also, State rights, and patents for England, France, and Russia.

$10. $15. $20. $25.

THE CELEBRATED IMITATION GOLD HUNTING WATCHES,

"Collins' Metal" (Improved Oroide).

These justly celebrated Watches have been so thoroughly tested during the last four years, and their reputation for time and as imitations of Gold Watches is so well established as to require no recommendations. Prices—Horizontal Watches, $10, equal in appearance and for time to Gold Watches worth $100; Full-Jeweled Levers, $15, equal to $150 Gold ones; Full-Jeweled Levers, extra fine and superior finish, $20, equal to $200 Gold ones.

We have just commenced making a very fine American Watch, full-jeweled, patent-lever, chronometer balance, adjusted to heat, cold and position, 4½ ounces down weight, equal in appearance and for time to a Gold Watch costing $250. We charge only $25 for these magnificent Watches. All our watches in hunting cases, gents' and ladies' sizes, chains, Collins Metal, $2 to $8. Also, all kinds of jewelry, equal to gold, at one-tenth the price.

CALIFORNIA DIAMONDS SET IN GOLD.

We are now making jewelry of the California Diamonds. These are real stones of great brilliancy and hardness, and cannot be distinguished from the genuine stones, even by good judges. They are particularly brilliant at night by artificial light, do not scratch or become dull by use, and retain their brilliancy for an indefinite time. The following are the prices:

Ladies' and Gents' Finger Rings, single stones, one carat weight.....$5 each.
Gents' Pins, single stone, according to the size of the stone.....$4 to $6.
Ladies' Cluster Pins.....$7 50.
Ladies' Cluster Earrings.....$7 00.

TO CLUBS.—Where six Watches are ordered at one time, we will send a seventh Watch free. Goods sent by express to be paid for on delivery.

Mining and Scientific Press

PUBLISHED EVERY SATURDAY,

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All new patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveies, throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET.

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Reading for the Hour.

Nature's Electrical Machines.

Friction is a more general source of electricity than is commonly supposed. It is well known that, if we rub a stick of sealing wax or a glass tube with a silk handkerchief, it becomes electrified. So does the bendkerchief also, although somewhat differently, the one being *positively*, the other *negatively* electrified, as it is called. The familiar electrical machine is merely a contrivence for rubbing glass and silk together, only as the surfaces of friction are increased, the effect is greatly enhanced. Now it has been found that almost any sort of friction produces electricity. Thus, it is developed by blowing air over glass. The "hydro-electric" machine, one of the most powerful generators of electricity known, is simply a steam boiler, so constructed that globules of water rub against the sides of a peculiarly made vent-cock.

As the air is continually rubbing against the earth, sometimes with great rapidity, we cannot think it strange when we find that both are constantly in an electrified condition. And when a storm arises, and the clouds filled with water rush over the surface and rub against hills and trees and one another, we can see how a vast charge of electricity is stored up. As the atmosphere is a poor conductor, this charge grows continually, until finally it acquires force enough to break all barriers, and the lightning flies to the earth, as in the electrical machine the spark leaps from one wire to another.

But while for some purpose, to us as yet unknown, nature thus stores up atmospheric electricity, she also guards against its doing us injury by providing numberless conductors which quietly and harmlessly receive the charge and bear it to the earth. We use the lightning-rod for this purpose; but nature provides much better conductors in the trees and plants, whose myriads of points are directed to the sky, in the mountain chains, whose summits pierce the clouds, and furthermore, in those winged messengers, the rain drops, which thus protects while moistening the parched ground; and it is only in extraordinary circumstances, when electricity is developed more rapidly than it can be dissipated through these channels, that a violent discharge occurs.

A Sign of the Times.—The general principle on which Americans, as a rule, are supposed to eat, is to dispose of as large a quantity of food as possible in the smallest possible time; and there is a pretty large grain of truth, too, in the supposition. Whether he is actuated by this idea and wishes to improve on it, or not, we don't know; but a certain restaurant keeper in this city has put up a sign of "high-pressure board" before his establishment. As we are unwilling to put our legs into bear-traps for the general edification of the bystanders, so we have hesitated about testing the merits of this particular eating-house, fearing the result of being subjected to the process. We are ready, however, to receive information from any philanthropic individual who is inclined to risk his digestion for the sake of the public weal.

How "Punk" is Made.—Punk, or German tinder, is made from a kind of fungus or mushroom, that grows on the trunks of old oaks, ashes, beeches, etc. It should be gathered in August, or September, and is prepared by removing the outer bark with a knife, and separating carefully the spongy, yellowish mass that lies within it. This is cut into slices, and beaten with a mallet to soften it, till it can easily be pulled asunder between the fingers. It is then boiled in a strong solution of saltpeter.

Put not your trust in money, but put your money in trust.

Mud Volcanoes.

There is a certain class of so-called volcanoes which eject, in the place of lava, water and slime, and often a huge number of fishes. These, of course, are not proper volcanoes, nor are they phenomena directly connected with volcanic activity. They sometimes arise from a sudden melting of masses of snow in the snow region of high peaks or from a similar cause; sometimes they come from subterranean cavities, which are filled with water, and in which a small variety of fish, the *Pymelodus Cyclopum*, abounds. Very likely the violent shocks of internal volcanic activity open cracks in the ground, through which the water, mixed with mud, is violently ejected. Sometimes so much of this is thrown up that quite an extent of adjacent land is covered, and the air, for a long distance around, tainted with the odor of decayed fishes. Such phenomena are seen in South America and other places.

There are also phenomena to which the name of mud volcanoes is particularly applied. These are formed by inflammable and other gases rising through accumulations of argillaceous slime. As the top of the slime begins to dry, forming a thin crust, the gases blow up and pile this in conical heaps around crater-like openings, the heaps gradually increasing in size as the operation continues. A rainy season will often level these heaps, which are again formed in dry times. Such mud volcanoes, out of which sometimes flames of burning gas issue in long jets, or naptha, mineral oil, or salt solutions flow, are known in Sicily, Modena, the Crimea, on the island Taman (in the south of Russia), on the shores of the Caspian Sea, in Java, New Grenada, etc.

Mud Volcanoes of New Grenada.

In the Colorado Desert, about latitude 33° 24′ and longitude 38° 42′, there is an area about one-fourth of a mile long and one-eight wide, which is covered with mud volcanoes. The surface of the ground, which is of soft mud, is continually agitated by escaping steam, hot water and sulphurous gases. These sometimes rise steadily with a hissing noise, and sometimes heave up and burst the top mud, often throwing it high in the air, at irregular intervals. In many places they gradually form hillocks, often of a very regular conical shape. Here and there are jets of boiling water twenty-five to thirty feet high; and not unfrequent are large basins, a hundred feet in diameter, in which a bluish pasty mass is bubbling and seething. Deposits of sulphur and of carbonate of lime are found, and the air is strong with sulphureted hydrogen. The noise is audible at a distance of ten miles, and the vapors are visible at a much greater distance. It is dangerous to approach very near to the basins or springs, as one is liable to break through the thin surface crust, and as, moreover, new vents are being continually formed, in which case the slime and steam are thrown up in sufficient quantity and with violence enough to prove fatal. This region, although highly interesting, is seldom visited, as its very desolate situation makes the journey arduous and difficult.

Pure water will, under some circumstances, corrode lead pipes and dissolve more lead than water containing lime salts (hard water), which form a crust on the surface of the pipes and thus preserve them from the action of the water.

The Science of Eating.

Chemistry shows that we may distinguish four general classes of food: 1st, that class which principally supplies fat, fuel for the lungs and heat for the system, and which we will call heaters; 2d, that which principally supplies the waste of the muscles—the muscle makers; 3d, that which principally feeds the bones, the brain, the nerves, and gives vital powers—the brain and nerve suppliers; and, 4th, that class whose chief object is to keep the stomach in a healthy condition and the system cool and free, which we will call waste. No one of these classes alone will support us in a healthy state, nor all together, unless used in proper proportions. These proportions vary according to the various circumstances and conditions of life, and the science of eating—of which, simple as it is, so little is generally known—consists merely in selecting our food so as to supply our bodies with the requisite relative amounts of heaters, of muscle-makers, of brain and nerve-suppliers, and of waste.

To attain this science we need no long years of study. Nature, which has taught the brute creation to select the right kinds and quantities of food, has not neglected man, but has given him reason, appetite and taste, to guide him. The difficulty is, that we neglect and corrupt our guides. Take a simple example of nature's teaching. In cold weather we desire and can eat without unpleasant results fat meats, butter and similar articles; in summer our desire for these is less, and if we indulge heartily in them we become torpid, indolent and sleepy, if not absolutely sick. And why? Because in cold weather we *need* more, and in warm less, of this class of food which are preëminently heaters. In warm weather we desire fruit, green vegetables etc.—waste—to keep us cool and our bowels open, while in the cold these articles do not satisfy us because they do not supply the necessary heat and muscle. Again, nature provides us with proper food according to our different conditions. If we eat a grain of wheat and examine it under a microscope or by chemical analysis, we find four distinct parts; an outer coat or bran containing iron and other elements required by the system and also woody fibre useful as waste; next a layer which contains chiefly heaters, and finally the germ holding the brain and nerve suppliers. Moreover the relative amounts of these differ in hot and in cold climates, northern wheat holding more, and southern wheat less, of the heaters, etc. Man is, however, strangely unwilling to follow nature, and fashion has ordained that we should undo what has been so carefully done for us, that we should use superfine or bolted flour,—that is flour consisting principally of heaters, as the other parts being glutinous are rejected with the bran in the process of bolting; and thus instead of getting an article on which alone we could thrive, we get that which will sustain life but a short time; for experiments have shown that superfine flour will keep animals alive only 50 to 60 days, while those fed on unbolted flour will thrive an indefinite period. Yet give a child or a person whose taste is unperverted the choice between bread made of bolted and that made of unbolted flour, and the latter will be preferred.

A man working hard in the cold needs in a higher degree heaters and muscle-suppliers. For such a man, fat and lean meats, as pork and beef, are the staples. Northern corn, beans and peas, cheese, etc., are good. These are not all very easily digested, but in cold weather the stomach has stronger digestive powers than in warm, and it is just as rational to exercise our stomachs as to exercise our muscles. The same man in warm weather needs but little fat, can substitute veal for pork, take lean meat, hominy and the vegetables which nature provides at such seasons.

The man engaged in labor requiring more mental and less bodily exertion needs, of course, more brain and less muscle supplies. Lean meats, fish, barley, unbolted wheat, bread and milk, a certain amount of vegetables, etc., are proper. Let such a man observe his mental capacity after a meal of fried pork and potatoes, or white bread and butter, or cakes and syrup, or farinaceous pudding, and then after one of rare roast beef, or beefsteak, or fish and potatoes, and see how much more mental labor he can perform in the latter case.

The sum of this whole matter is this: that if we watch closely we can easily see what nature indicates, and by following her indications, in sickness as well as in health, we shall certainly go aright.

The Great Cardiff Giant still continues to excite curiosity and interest. An offer of $70,000 for the whole, and one of $25,000 for an eighth interest in the figure, have been refused. While one set are ridiculing the thing as a first-class humbug, others are diligently working up speculations to account for it. The latest idea we have seen stated is, that it was made by the Northmen; and in support of this, Clerk's "History of Onondega," published in 1849, is quoted. In this book it is stated that a tradition was extant among the Onondaga Indians that among the objects injurious to their nation were "the big hog, the big bear, the horned water serpent and the stone-giant." As the giant has been found to be entirely harmless and quiet at the present time, it is to be expected that the big bog, the big bear and the horned water serpent will shortly be discovered, to make the thing complete, and all combined to one "happy family."

One of the new members of the Board of Supervisors has proved a valuable acquisition to the Ring. Not only does he lend the influence of his voice in the meetings of the Board, in its support, but lately he has been adding to this the weight of his fist in outside encounters with those who differ in opinion. This by no means novel line of argument, although extremely forcible, is still open to some objections; and we expect to hear the fact held up in Eastern cities as an example of how difficult questions are settled on this coast. If we care anything for the reputation of our city, it would be well to prohibit the publication of such little meetings, as it seems nearly impossible to prevent the meetings themselves.

What Would Occur if the Earth Should be Stopped in its Orbit.—If the earth should be stopped in its orbit, it would begin to fall straight towards the sun. As it approached more nearly to that great source of heat it would soon reach a point where the temperature is as high as 212°, and then all the waters of the ocean would soon be evaporated. As it drew still nearer, the rocks would be melted, and afterwards they also would be evaporated. Before it reached the sun this solid earth would be converted into a vast volume of red-hot gas, which when it fell into the fiery atmosphere of the sun, would merely produce blasts of wind at the point where it struck outward in all directions.

Musical Festival.—Camilla Urso proposes to get up a grand Musical Festival, to be held in this city, for the benefit of the Mercantile Library. Musicians from all parts of the coast are to be invited to take part, and it is thought that to such the railroad companies will give free passes; moreover, that the hotels here will make proper reduction in their prices. It is estimated that some 12,000 spectators can be accommodated in the Pavilion, and that several hundred musicians will participate.

Edwin Bryant, author of a book giving account of two trips to California in 1849, and 1850, lately jumped from a three-story window in Louisville, and was killed.

TO MAKE NEW ROPE PLIABLE.—Many of onr readers have experieneed great difficultyin handling new ropes. Every farmer knows how nnmaageable a new, stiff ropehalter is, and his patience is severely tried when he tries to tie up his eattla with it, as the ropa will coil itself iato every shape bat the one required. Often he fiads his horses and cattle rsmpaging aboat the barn, haviag loosened the kaots of the new halters. By simply boiliag the rope in water for two hours, all this trouble can be avoided, and the ropo made as pliable as if used for months. Its strength is not diminished, but its stiffaess is goae. It must hang in a warm room until thoroughly dried, and not allowed to kink. This easy remedy will secure horses aad cattle from many kicks and blows, and prevent mnch profanity.

A SCIENTIFIO Swede of a statistieal turn of mind has compnted that the explosion of a qnarter of a ton of glyceriae would blow the entire territory of Sweden into the middle of the Aretio Sea. So the *Rigsdag* interfcres, and bnrghers parade the streets bearing banners, upon which is inscribed the Swedish equivalent of "No Glyeerine."

A Word for Home Inventors.

OAKLAND, CAL., December 1, 1869.

MESSRS. DEWEY & Co.—Gentlemen: Permit ns through yonr paper to return our earnest tbanks for tbo prompt and successful manner in wbicb you have condncted the various matters of business with tbo Patent Office committed to yonr care, more especially in securing for us our last valuable patent in the face of so many difficulties. Were it an ordinary case, in which you bad simply secured us a patent, and for wblch services you bad received a suitable equivalent, we sbould hardly consider you entitled to our thanks, however much we might feel gratified with your professional ability, uniform courtesy, or success. But this seems to be an exceptional case, and entitled to peculiar consideration. Without entering here into a detailed account of the legal complications and various discouraging circumstances you were obliged to contend with, suffice it to say, tbat your almost unboped for success, securing, as you did, a full patent, despite all these obstaclee, in so short a time, was scarcely less surprising than gratifying to us; and we feel it a pleasant duty to offer you this merited testimonial of our appreciation for the valnable services rendered, and to return you our sincere thanks for tbe same.

In closing, we would say to tbe public that tbis is entirely voluntary on our part, as Messrs. Dewey & Co. neither asked it at our hande, nor knew that we intended giving it. It is simply a free-will offering to professional skill and reliability, and a word of friendly counsel to otbers on tbis coast wbo may be possessed of valuable inventione on which they wish to eecure patents. To all euch our earnest advice is to place them at once in the bands of Dewey & Co., instead of being driven to it by a sad experience like our own.

Yours truly, HUBERT BURGESS,
JAMES STRATTON.

FOR THROAT DISEASES and affections of the Chest "*Brown's Bronchial Troches*," or Cough Lozengea, are of great valne. In Cougbe, Irritation of the Throat caused by cold, or Unusual Exertion of tbe vocal organs in speaking in public or singing, they prodnce the most beneficial results. Tbe Troches bave *proved* tbeir efficacy,

To a lady friend, no present would be more acceptnble than a pair of opera glasses. C. Muller, 205 Montgomery, has a fine assortment. ***

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

PAIN KILLER, after a thorongh trial by innumerable living witnesses, hae proved itself THE MENICINE OF THE AOE. It is an internal and external remedy. One positive proof of its efficacy is, tbat its salea have constantly increased, and wholly upon ita own merits. Tbe effect of the Pain Killer upon the patient when taken internally, in cass of Cold, Cough, Bowel Complaints, Cholera, Dysentery, and other affections of the syetem, has been truly wonderful, and has won for it a name smong medical preparations tbat can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns; Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, bas secured for it such a host of teetimony ae an almost infallible remedy that it will be banded down to posterity as one of the greatest medical discoveries of the nineteentb century.

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wbolesale Agents. dc4

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use t for any of these, and yoa will never do without it. Its success as a valnable family medicine has induced others to initiate and counterfeit the Pain Killer to somo extent. *Beware of Counterfeits!*

We would call particular attention to our
SCOTT & ECKART CUT-OFF ENGINE.
As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Off at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:
"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very steadily and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 60 horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Monty Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,
Planers, Shapers, Drills, Etc.,
On hand and for sale. Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after a trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Non-acidulated Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Ayer's
Hair Vigor,
For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a
HAIR DRESSING,
nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.
Prepared by Dr. J. C. Ayer & Co.,
PRACTICAL AND ANALYTICAL CHEMISTS,
LOWELL, MASS.
PRICE $1.00,

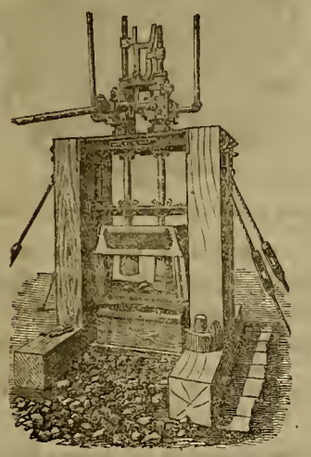
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

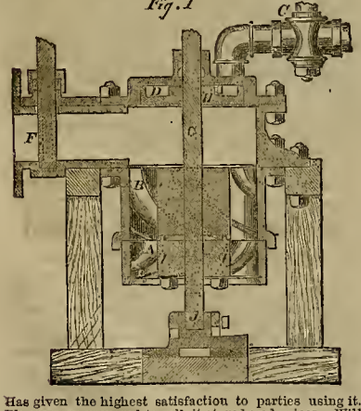
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

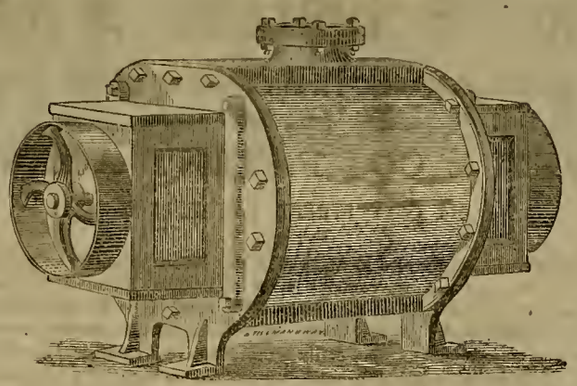
A. LIND, Millwright,
Pacific Iron Works, San Francisco.
Refer to John Sime and J. Haley. 19v19

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

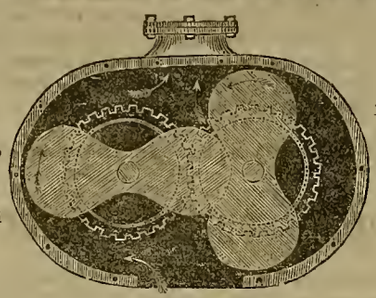
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

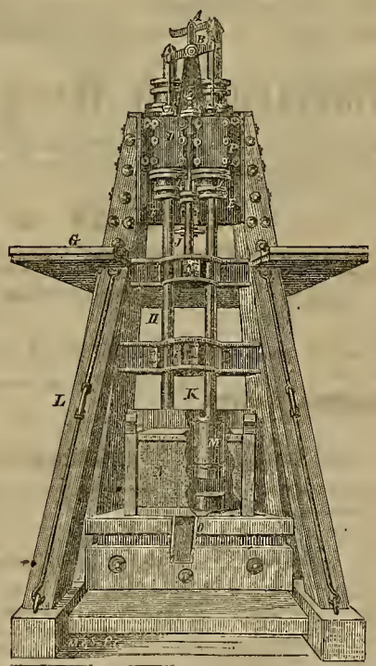
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16-3m Globe Iron Works, Stockton, Cal.

TAYLOR'S IMPROVED

STEAM STAMP MILL.



This Mill is driven by a direct application of steam to the stamps. It saves from fifty to seventy-five per cent. of the cost of the ordinary stamp battery, performing the same amount of work,

Cost of Mill with a capacity of 25 tons per day, $2,500.

THIS MILL IS LESS COMPLICATED

THAN ANY OTHER IN USE,

And, consequently, much less liable to get out of repair. See illustration and detailed description in the *Mining and Scientific Press* of October 30th, 1869. For further information, reference may be made to PRESCOTT, SCHIEDELL & Co., Marysville, or address

GEO. A. TAYLOR,
19v19-1am3m San Francisco, Cal.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

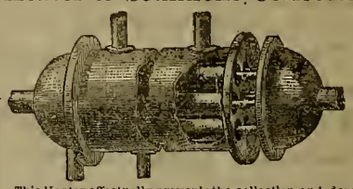
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the office, **220** Fremont street.

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,

A First-Class Illustrated Newspaper for the Pacific States. Annual Subscription Reduced to $4, January 1, 1870.

The Scientific Press,

A Journal of Mining, Farming, and Mechanic Arts.

PUBLISHED EVERY SATURDAY BY

DEWEY & CO., PATENT AGENTS,

No. 414 CLAY STREET, SAN FRANCISCO.

THE SCIENTIFIC PRESS, devoted to SCIENTIFIC AND MECHANICAL PROGRESS, MINING, FARMING AND MECHANIC ARTS, contains more VALUABLE READING MATTER than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely, and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our better citizens have an active interest in the new discoveries and in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast and jointly represented in the PRESS, rendering the paper a popular and influential journal with all industrial readers. Subscription reduced to $4 a year Jan. 1, 1870.

The PRESS is the most valuable and best patronized weekly advertising medium in the Pacific States.

To Inventors on the Pacific Coast.

Our U. S. and Foreign PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or description in the SCIENTIFIC PRESS. We transact every branch of patent business, and obtain patents in ALL CIVILIZED COUNTRIES.

The large majority of United States and Foreign Patents granted to inventors on the Pacific Coast during the past few years have been obtained through our Agency. Established in 1860, we have an extensive patent library, with full record of cases on this coast, with complete U. S. reports, and can give the best and most reliable advice as to the patentability of new inventions. Advice and illustrated circulars free. Our prices are now as favorable as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

The Illustration of Inventions

In the SCIENTIFIC PRESS is a high recommendation for them, and is the best and cheapest method of bringing them to the notice of the public in a proper manner, besides being the most effectual method of selling valuable patent rights and patented articles.

Engraving on Wood

Of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also engraving on metals.

ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market,

MANUFACTURER OF

SPAULDING'S

Patent Tooth Circular Saws.

They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE,

At the lowest Market Prices.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. N. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucibles of Dixon's make over Aduis, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

18v18-9p 519 Front street, San Francisco

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Metalline—A New and Important Invention.

It is said in a New York paper that a number of scientific and practical gentlemen, connected with manufacturing and other machinery in that city, have been for several months watching the operations of an invention that aims at the entire abolishment of oils and all other lubricating material now used for boxes, slides, and every condition of motion where metallic friction is to be overcome or expected. It is also claimed that such a result has been fully achieved, and there are engines now running with this material, that, the proprietors aver, have worked to complete satisfaction for several months. Such, in general terms, is the claim of this novel invention. It is said to be the work of a well known scientific and practical gentleman, who has spent a great deal of time in working out this result.

The exact nature of the present invention is not given, for the alleged reason that patents are being sought for in several countries, which would be placed in jeopardy were any clear description of the materials and processes given. It may, however, be said in a general way, that the discovery—which has received the name of metalline—consists of such combinations and manipulations of various metallic substances as will make a surface on which the ordinary journals, axles, etc., will run with much less friction and heating than is due to any of the lubricants now in use. These, briefly, are the claims, and the inventor refers to a large number of trustworthy gentlemen who have examined and tried the substance.

The above sounds very much like "humcombe," although there may be something of value in it; and we shall soon know all about it, as the inventor assures the public that a company has already been formed to enter largely into the manufacture and sale of the new lubricant as soon as the desired patent protections have been secured.

THE *Overland Monthly* for January has been received, and is well up to the standard. It commences with an excellent article on San Francisco, which tells us in public what we are willing to confess only in private—that we do have some faults. "Centerpole Bill," and "The Luck of Roaring Camp," are very readable domestic stories. "Frau Trudchens' Dream" is very good. "Some of our Birds" tells us something of a subject of which we ought to know more. The other articles are generally good.

THE TABLE OF CONTENTS of this and other numbers of the present volume will be found on the last page. A perusal of the index gives some idea of the large amount of valuable information stored up by those who read or peruse this journal.

A NEW PAPER.—The *Evening Tribune* made its advent on the San Francisco stage this last week, supported by a brilliant troupe of gaily clad newsboys.

Patent Shaft Coupling for Vehicles.

Often much trouble is experienced in removing the shaft from a vehicle from the fact that the pins or bolts of the coupling have become rusty, and adhere so obstinately as to make requisite the use of considerable patience and of considerable force applied by means of a wrench for their removal. In all our couplings hitherto devised, moreover, we have more or less of the noisy rattle which is so disagreeable, especially to nervous people, or to persons driving out in pursuit of health.

The inventor of the coupling, shown in the illustration, for which we are indebted to the *American Artizan*, thinks he has completely obviated both of these troubles, having so constructed it that the shaft can easily be detached by hand in half a minute, and that no noise results from its use.

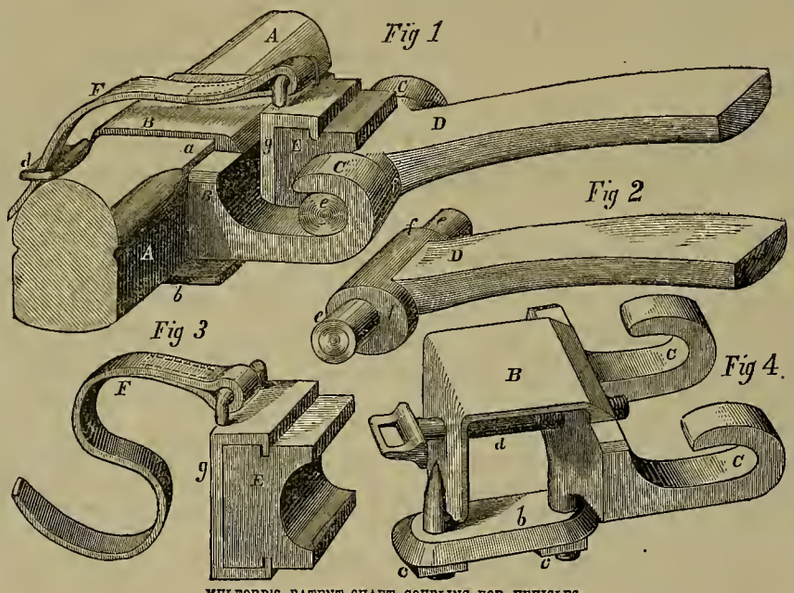
In the cut, Fig. 1 shows the coupling attached to the shaft; Fig. 2 the shaft; Fig. 3 the elastic pad which retains the shaft in the socket of the clasp, Fig. 4, which attaches the coupling to the shaft.

Where the coupling is to be attached, the axle, A, of the vehicle has squared portions, a, to receive the clasp, B. This is held in place not only by the plate, b, screwed up against the under side of the axle by means of the nuts, c, (see Fig. 4), but also by the screw-bolt, d. The clasp, B, has two hooks, C, which extend forward and hold the cylindrical lugs, e, of the shaft, D, any side motion of the latter being prevented by the shoulders, f.

A pad, E, of India-rubber is secured to a metallic back-plate, g, and placed behind the shaft-iron, thus holding it in place, while the pad itself is prevented from slipping to one side or the other by the ends of the hook, C, which embrace it on either side. To the back-plate, g, there may be attached a leather strap, F, the end of which passes through the slot in the head of the screw-bolt, d, and thus prevents it from turning.

Now as the shaft-iron is held in the hooks, C, with an elastic pressure by means of the india-rubber pad, E, there can be no rattling or jarring when the vehicle is in motion. Moreover, the elasticity of the pad enables one to remove it without the exercise of any great force, and in a short space of time.

These couplings being strong and durable, can be used for express, truck, or any heavy wagons, as well as for light carriages and sleighs.



MULFORD'S PATENT SHAFT COUPLING FOR VEHICLES.

The inventor, whose patent is dated August 4, 1868, is Mr. I. H. Mulford, of East Orange, N. J.

STATE FAIR PREMIUMS.—The following awards of gold medals are reported by the Special Committee: John Hall, Alameda, best display of stock; Norton Bush, San Francisco, medal for fine arts; N. P. Cole & Co., San Francisco, best display of furniture of California wood; I. N. Hoag, cocoons, mulberry trees, etc.; H. M. Bernard, Sacramento, carriages, California made; Capital Woolen Mills, Sacramento, cloths, cassimeres, etc.; J. R. Nickerson, Placer county, fruit of all varieties. A special gold medal was awarded to S. B. Whipple, San Mateo, for display of Hambletonian stock; also to Huntington & Hopkins, Sacramento, for hardware of California manufacture.

SALE OF THE UNION HILL MINE.—It is reported by telegraph, under date of the 23d inst., that the Union Hill Mine, Grass Valley, went into possession of the Pacific Mining Company, of London, on that day, having been recently sold to them by Mr. Findley.

The Mines Our True Source of Wealth.

We have received an interesting paper on this subject, which, however, is rather too lengthy for our columns, especially as the subject has been treated so fully of late. The writer is an "old miner," who zealously defends the importance of his profession, at the same time that he is alive to the defective manner in which this important industry has been conducted. His indignation has been excited of late by articles which have appeared, and he reflects severely on those persons "who affect to ignore the existence and importance of the mines, and who sneer at the efforts, trials, successes and failures of the poor miner."

In the course of the article it is shown how the mines originally attracted people to our coast, built cities and towns, gave rise to and sustained commerce and agriculture, and rendered the Pacific Railroad first a necessity and then an accomplished fact. The dependence of the several branches of industry on the mines is minutely traced out. "Without the mines," he says feelingly, "there would be no churches, no schools nor children to fill them, no 'school-marms' nor people to court them."

The history of mining on this coast is spoken of briefly. It is proved that the mines are by no means "played out;" on the contrary, all indications tend to show that we have merely commenced to get at the subterranean treasures of the country. The causes of the diminished production are shown to be incidental and not to arise from the exhaustion of the mineral stores.

The writer claims that the present dull times are, in part at least, due to neglect of the mining interests. If people, he argues, had remained faithful to these, and not gone headlong into land speculations, expecting thereby to grow suddenly rich on the completion of the Pacific Railroad, we should now be in a much healthier condition. And in this connection he shows the injury done to the country by the wholesale land-grabbing.

In conclusion, the writer appeals to the public to give more attention to legitimate mining. He shows that in spite of mismanagement the mines are no worse investments than are other kinds of business. [By the way, we see that an Eastern statistician has computed that 95 per cent. of our merchants fail some time in their career. —ED.] "We do not advocate," he says, "the neglecting of any legitimate business, nor do we advise a general stampede to the mines, but we do ask that the mining interests receive the attention they are entitled to."

LARGE droves of cattle from Texas are reported *en route* to this State.

Communications.

What are Metals?

[Written for the Mining and Scientific Press.]

Editors Press:—Some time ago I commented in your valuable paper on the question: *What are metals?* and concluded that metals are elementary bodies, which are good conductors of electricity at common temperature (providing they are in a sufficiently condensed state); but this distinction would not be of much benefit, since the conducting power for electricity seems mostly to depend upon a certain particular condition or density; for instance: glass and resins, in a solid state, are insulators. When wet, they will conduct electricity. [The water in which they are enveloped forms the conductor—not the glass, resin, etc.—Eds. Press.] All the gases are insulators; but all ignited gases or flames are conductors. Water is a conductor; but dry ice and dry steam do not conduct electricity. Carbon is an excellent conductor, if properly prepared; but crystallized carbon or diamond is an insulator. Metals, although they are the best conductors, will not conduct electricity when in a finely divided state.

I do not see much benefit to be derived from the above distinction between metals and non-metallic elements, because some conduct electricity in one condition, and others under different circumstances.

Far more important would it be to answer the other very curious question, put by the same author, namely: *Whether ammonium is a metal?*

Ammonium (NH^4) is composed of one atom of nitrogen and four of hydrogen; and as metals are generally considered to be elements or bodies that cannot be decomposed, it may seem out of place to admit a compound among their number; but I will point out the reasons that will compel us to do so.

The so-called ammonium (NH^4) forms an amalgam with quicksilver, under precisely the same conditions, from the corresponding salts, as sodium amalgam. If we submit a solution of common salt (chloride of sodium) to the decomposing action of a galvanic battery, the sodium will be attracted to the negative plate, and if any quicksilver be present, it will form an amalgam (sodium amalgam) which will adhere to the negative electrode. If we try the same experiment by the use of sal-ammoniac (chloride of sodium) instead of common salt, the same action will take place; the mercury at the negative electrode will swell up to many times its former size, and form an amalgam of ammonium. This amalgam has the same appearance and possesses the same corresponding affinities as the sodium amalgam.

According to natural laws, only metals are able to form amalgams with quicksilver. We are, therefore, obliged to call ammonium a metal; and, furthermore, ammonium being a compound, we have the right to say the same of sodium; and, in fact, we must admit the possibility of all the other metals being compounds.

In one of my previous communications I proved by a very simple experiment that the sulphate of copper cannot be considered as being composed of oxide of copper and sulphuric acid ($CuO + SO^3$), but of metallic copper and a higher oxide of sulphur ($CuO + SO^4$); and SO^4 being a compound, we have a right, according to the dualistic theory, to consider the metal copper likewise a compound body. Many other proofs could be given on the same point.

That we have not been able to decompose metals is no reason to infer that it cannot be done; but what the different metals are composed of, and how they can be decomposed, I leave to wiser men than myself to determine. Edward Pique.

A Rutland (Vt.) slate pencil company has recently put up a machine which will cut, it is said, 20,000 pencils in an hour.

Stetefeldt Furnace vs. Capital.

[Written for the Mining and Scientific Press.]

Editors Press:—The success of the Stetefeldt furnace, as reported in your issue of the 11th inst., is of a practical value to Eastern Nevada, infinitely surpassing the discovery of any mining district that has hitherto been made in it, not excepting White Pine. There is no lack of ores in this part of the State of a grade considerably above the average yield of the Comstock lode, which are now disposed of with no other recognition or notice than that contained in the trite laconicism, low grade ores, which has become synonymous with irredeemably unremunerative.

As a miner, I hail the advent of a brighter era which the inauguration of this furnace introduces. Its direct pecuniary advantage to the producer of ores is immense, while its indirect effect is no less to be appreciated. I allude to its tendency, if its benefits are rightly appropriated and applied, to release to a considerable extent the miner from his dependence on outside capital. Such independence, properly asserted, would be the surest way to tempt capital, and secure its subserviency to the interest and progress of mining.

Who can estimate the difference in the aggregate of a net increase of from $12 to $20 per ton on all ores will produce throughout a region of country, embracing an area of at least 1,000 square miles, and everywhere teeming with the luxuriance of argentiferous minerals? It is only by the aggregate of calculations of individual mine owners, from their several stand points, submitted as a basis of induction, that any approximation to the real issue can be obtained.

Associate with this great stride in metallurgy, the principles of coöperation in mining, and its inevitable tendency would be to declare the miner comparatively independent of capital, as an indispensable condition of his success.

The principle of coöperation proceeds, so to speak, on natural facts as a basis, and arrays its forces, which are real, against the assumptions of that abstract thing denominated capital. That it has value as a force inseparably its own, no one would attempt to deny; but that it has arrogated to itself powers and importance not legitimate, is equally incontestable.

To accomplish without capital what capital was considered an indispensable condition of, is to claim effectually the principal channel on which it relies for its support; and in proportion as this opposition is extended and succeeds, will be the diminution of the power it possesses until reduced to its own legitimate sphere.

In precisely the same ratio, as the fictitious power of capital is reduced, will be the increase of that power or forces subverting it. There is no surer way to demolish a fictitious thing than by removing the supports, and impeding and diverting the contributory channels which are essential to its being. If the absolute forces upon which the generation of capital depends, are agreed that its domination shall cease, and adopt proper measures to such an end, its mandate must be obeyed, and capital can offer no successful resistance to its decrease; but I scarcely need say that truth and reason must be the basis of its action.

If coöperation in mining developments, on a properly adjusted scale, succeeds, metallurgical successes in working the ores, which we have ample reason to expect will take place from time to time—the result of experiments in a few judiciously selected fields, accompanied by a reasonable reduction in the prices of all merchandise—such an impetus will be given to this industry that greater forces would be necessary to check its progress than now appear to be necessary to set it in motion. It needs no effort at demonstration to convince any one at all conversant with the facts that the high charges for milling ores, and the large deduction for wastage in their reduction, has hitherto been the greatest impediment to mining. A charge of $40 per ton for milling, and an arbitrary deduction of 20 per cent., only foot up the modest amount of from $60 to $75 per ton on ores varying from $100 to $175; whilst by Mr. Stetefeldt's figures, furnished in your article, the maximum of loss, if applied to $175 ores, would amount to no more, including the actual expenses of milling where wood is cheap, than $35 per ton. Of course the difference here spans the margin of two extremes—that of reducing your ores at a custom mill, and that of having a mill of your own, which difference legitimately belongs to the credit side, instead of the debit side, of mining accounts, and no efforts should be spared in assigning to it its proper position. Its effect, rightly applied, would be incalculable. Pro and Con.

Ellsworth, Nev., Dec. 17, 1869.

New Processes for the Reduction of Rebellious Ores.

[Written for the Mining and Scientific Press.]

Editors Press:—It is to be regretted that the discussion of a subject most vitally interesting in connection with the progress of California, should be so much embittered by acrimony. Whether this arises from personal feeling or from the conflicting interests of the contending parties, the result is alike injurious to the cause of progress and to their own dignity. This has been made to me the more apparent from the communication on the above subject in your issue of December 4th.

The writer, while asserting many facts connected with the practice of metallurgy, inseparable from extending operations, betrays an amount of querulousness which injures more than benefits the legitimate developments which he espouses.

Though evidently himself not deficient in prejudice against such ideas as may conflict with his own, he gives utterance to many truths; not the least of which is his allusion to the uncertain, vacillating and vexatious actions of the United States Patent Office in the granting or rejecting of patents bearing upon the same matter.

Whether such action is to be attributed to the unfortunate rotation in office system, and to the consequent lack of information possessed by those officials, or to causes which it might be libelous to accurately define, I am unable to say; but the fact is undeniable, that patents embodying general principles which had been anticipated in previous patents have been granted, while positive improvements have been rejected. Of this, the patent of Dr. Rae, mentioned by your correspondent, is a notable instance.

With regard to the number of new processes proposed, doubtless many are utterly valueless; but to deprecate all such endeavors is to check the progressive genius of the age. When it is remembered that Dr. Lardner, whose talent in mechanical and chemical science was undoubted, declared that trans-Atlantic steam navigation was an impossibility; when other men of equal renown declared that the passage of a railway train through a tunnel, a mile in length, would suffocate all the passengers; that a speed exceeding thirty miles an hour would interfere with the healthy action of the lungs of passengers, we can without serious offense conceive that "C. H. A." may be in general error as to future discoveries in chemical metallurgy.

That the chemical action between the ingredients of the "Fonda" or other Mexican process generates electricity is apparent to the merest tyro in that science. The question then arises, does such electrical action retard, or does it aid and facilitate, the operation? The discoveries of Sir Humphrey Davy most decidedly confirm the idea that it aids the process. This being the case, it is probable, to say the least, that the more energetic application of electricity may the more energetically assist the operation.

The assertion "that there is no ore of gold or silver on this coast or elsewhere that will not yield to the intelligent application of some one of the known processes," is true enough; but the further assertion "that no important discovery or invention in metallurgy, other than purely mechanical, has yet been made, or may be looked for for some time," arrogates a superiority of knowledge, somewhat self-sufficient. Probably it is because "C. H. A." has not sufficient time, or has not sufficiently arranged his ideas to enable him to perfect some embryo process at present culminating in his mind. How far his exception of Kustel's combination of Plattner's and Patera's processes may arise from some similarity of his own conception or adaptation, remains to be seen.

Bearing in mind that subjects affecting the interests of the community at large should be discussed in a calm, logical and dispassionate way, I should regret if the flippant manner of your correspondent should have betrayed me as to the exhibition of any acerbity of feeling. I am well aware that ridicule is no argument, and that arrogating too much to one's self is always injurious to the end in view. I would also add that it is impolitic to announce too publicly such operations as I may be investigating. I would merely deprecate the premature condemnation of processes as yet unknown to the condemner. John Scott.

San Francisco, Dec. 20th, 1869.

Mines in El Dorado County.

[Written for the Mining and Scientific Press.]

Editors Press:—Being a constant reader of your valuable paper, and seldom finding any notice of the mines of our county, I have taken the liberty of trespassing on your valuable time and space by sending you a few items.

We have several valuable mines of quartz in the immediate vicinity of Placerville. The Shepard mine is at present taking the palm for abundance of rich ore. I have been informed that it is paying $50 per ton.

The Epley mine, at present lying still, is a first class mine, and is on the same range as the Shepard.

The Church Union mine, lying south of here about seven miles, is one of the oldest in the State. The parties owning this mine have been sinking for the last six months, and, I understand, have developed a body of good ore at the bottom of the shaft. Mr. Church is the Superintendent.

One mile west of the Church Union mine is the Pocahontas, an old discovery, having been worked with varied success since 1850, first by Mexicans, and since by parties with limited means. The property is now in the hands of a company, and shows a flattering prospect of success. I was surprised to learn, however, that notwithstanding the mine had been worked so long, the shaft had only reached a depth of two hundred and fifty feet. No work is being done just at present, but I learn from the Superintendent, Mr. Burlingham, that the stoppage is only temporary.

Four miles south of the Pocahontas is the Havilah mine, which is, I believe, the first quartz mine discovered and worked in this State, having been located in 1849, and worked in 1850 and since with varied success by different parties. At present it is being worked by the Havilah Mining Company, who have a fine forty-stamp mill running by water power; the shaft has reached a depth of 350 feet, developing a fine body of good ore, which I was informed by the Superintendent, although somewhat refractory, was yet paying well. I see with pleasure that this Company is taking advantage of all the late improvements in mining and milling.

Forty-Niner.

Placerville, Dec. 13, 1869.

Green Tarlatan Poisonous.—M. Robierre has analyzed a sample of this fabric obtained at Nantes, and found it to contain 10.3 grammes of Schweinfurt green—arsenite of copper—equivalent to 6.03 grammes of white arsenic, to the square meter. A full dress made of this tissue, therefore, would contain no less than 391.4 grammes of copper arsenite, equivalent to 229 grammes of white arsenic. At every shaking of the tarlatan, even when very slight, clouds of a greenish dust came off.

Mechanical Progress.

New Shape for Screw-Taps.

Prof. Beylich translates from *Polyt. Centralblatt* a description of the method of cutting crew-taps at the large machino shop at graffonstaden. We quote a portion of tho article:

"The action of an ordinary tap doos not produce regnlar ohips; it does not leave room enough for them, uor allow tho oil easy access to the working-edges. Some improvements have hoen made, but the cylindrical or conical shape of the nuclens of the tap has heen retained. No tap, however, having a nucleus of a circular section, can over work advantageously. Tho tool ought not to touch the surface of the screw to he cut, hut just with its edge; and the cutting edgo ought to he freo at the back, and must thereforo have a tooth-like shape. The peculiar mechanism, attached to the turning lathe at Graffenstaden, does not turn the piecos circular, but so that it obtains a wavy surface. Tho cuttiug of the thread ie afterwards dono in the usual manner. Thus a screw of a wavy eection is produced with alternating swells and recesses, each of which extends over the whole length of the piece. The number of swells corresponds to the number of teeth intended to be given to the tap. To finieh the tap is only necessary to cut out one-half of each swell hy a planing or a milling machine, to a depth correspouding to the reqnired length of the teeth."

Machinery for the Andes.—Manning, Wardle & Co., a Leeds firm, have constructed the locomotives and other machinery for the Cerro de Pasco Railway in South America. Everything is to be transported on the backs of mules over 70 miles of road, which is impassable by any other means. *Engineering* for Nov. 26th says: "The maximum weight allowed for any one piece or package wae 300 lbs., and no object was to exceed 7 ft. in lengtb. The engines have outside cylinders 12 in. diameter, and are carried upon six wrought iron coupled wheels with steel tyres; the tanke are of tbe "eaddle" form resting upon the boiler barrels. As we expected, some clever echeming has been required to conform to tbe stipulated weights, of course the hoilers, tanke, frames, and wheels, and in fact all beavy parts go out in pieces; for instance, the cylinders and steam chests, usually cast in one, are in this case made in five pieces, the frames are made in sections, and the wheels, tyres, and axles are all separate. Messrs. M., W. & Co., have also constructed a fixed workshop engine, and boiler, together with a wheel latho, drilling machiue, lathes, blowing fans, and smiths' hearths and tools. In this case the maximum weight allowed was only 150 lbs. for each package. This necessitated the fast headstock of the wheel lathe being made in no less than fourteen pieces, and yet these are eo contrived that an ordinary observer would not notice anything special about it. A staff of hoiler makers and fitters in charge of a leading erector have been engaged to go out to Peru to erect the engines on their arrival."

Lathe Making—the Spindle.—From the correspondence of the *Engineer*, we extract the following: First-rate emiths are not always able to produce a sound lathe spindle. The iron is first forged into the required shape, and a piece of double shear eteel is welded round it to form the neck or bearing. Should this not be perfectly sound, it is pretty sure to "fly" in hardening. The bushes are steel cylinders, forged of douhle shear steel, and lapped with the best iron. Wben these eteel bushes are annealed they go to the turner, and are turned parallel outside. Then they are enbjected to a red beat, and snddenly immereed in running water, and sbould the slightbest flaw occur in the weld, they crack and have to be thrown aside. If all goee well, they are driven into the headetock bored to receivo them, and are lapped true and clear, or, in other words, polished by means of a lead lap running at a remarkahle speed. The spindle is annealed, then turned, heated to nearly a white heat, and plunged into a etream of water icy-cold. This is a eevere trial of the emitb'e work. The next process is that of polishing. This is effected hy placing it in a latho and causing it to revolve elowly, against an emery wheel running at considerable velocity in a contrary direction, until it is highly polished. Thue the spindle is a perfect "fit" when pnt into the bearings.

Whitworth's Method of Provino Guns. This consists, as Mr. W. says, in preventing tho shot from moving when tho powder is ignited, the gases generated hy tho explosion escaping only through the touchhole. About ono-sixth of the regular powder charge fired in this way gives the samo strain to the gun as a full charge fired in tho ordinary manner. To prevent the movement of the ehot, a screw is cut on the periphery of tho gun at tho muzzle, and on it is fitted a ecrewed cap having a eolid end. Tho gnn is loaded with a cartridge of the ordinary length, hut containing one-sixth of the regular charge, and supported by tin discs in the center of the bore; a flat-fronted shot, with tight wads to prevent any escape of gas, and a round steel har reaching from the shot to the end of the horo, are then introduced, and the cap with the solid end screwed on. The gun is then ready for firing, after which my measuring instrument is introduced into tho bore, and any enlargemont to the 10-100th of an inch in extent may be ascertained. If there he no enlargement, the powder charges may be gradually increased, until a slight enlargement has been produced. The real strength of each gun is thus positively ascertained, and this strength I would have recorded and stamped upon each gun.

Patent Frictional Gearing.—The *Engineer* for Nov. 26th, describes and illustrates a new frictional gearing with india-rubber facing, lately invented hy a Mr. Hall. We quote: "It consists simply of a thick elastic band fixed in a groove upon tho working face of the wheel, whether bevel or spur, and the power of friction is regulated in all cases hy adjusting screws fixed to one bearing of each set. Among its special advantages are the facility and safety with which the gearing of spindles may he thrown in and out of action at the highest velocities, it being applicable to couplings as well as to wheels of all classes. Especially will it he found advantageoue where noiseless, smooth, and steady action is required at great speed. We understand the gear has been tried in a cotton mill, and has proved a complete success. Apparently the great velocity at which it can he driven enables it to accomplish more work, with less expenditure of power, than can he effected with cogs; and as an economizer of power, cost, and maintenance, it should prove itself worthy of attention by all who employ machinery.

An Ingenious Crank Motion.—A new velocipede, described and illustrated by the *Scientific American*, has a crank which is so constructed that it lengthens itself to its maximum at the moment the leg is extended, and ehortens to a minimum as the foot passes under the center; therehy making the most of that muscular exertion which tends to propel the vehicle, and lessening that which does not so tend. We quote that portion of the description which shows how this is done:

"A grooved circle is attached to the standard, eccentric to the action of tbe wheel, and strengthened by lateral braces. The arm of the crank passee through a hole in the end of the axle, but is not fastened to it. In tbe groove of this circle plays a small friction roller attacbed to the crank behind the foot-piece, which causes the crank to slide through the hole in tbe axlo to and from the center during each revolution; its nearest approach to the center being during the time it passes under the center."

Steam Gauges.—The *Engineer* has the following: "A steam pressure gauge can only be used for three purposes. The first is to tell accurately the pressure in a steam boiler at any moment when the water is hotter than 212 deg.; tbe eecond is to tell variations in tbe steam pressnre from time to time; and the third ie to bring in money to the makers. We regret to eay that the last point ie more studied than the others; indeed, eo mucb etudied that the value of the modern mercantile steam gauge as an index of the pressure within a boiler at any moment is very small indeed."

New Notes in Photography.—A thin layer of gelatine made eensitive with bichromate of potash ie exposed to light under a photographic positive, and the partsacted upon by the light become insoluble in water. The gelatine ie then immereed in water, and the parts which have not been rendered insoluble, swell up, producing a picture in relief, from which a plaster cast is taken. From this an electrotype copy can be made which can be used as a eeal. The process may also be employed for obtaining electrotypes for the use of tbe printer.

Scientific Progress.

Geological Time—A New Fact.

We have given in the Press notes of eome of the new points established by Dr. Carpenter and Professor Thompson, during their last year'e cruise in the Lightning. We find the following statement in the *Engineer*, in connection with the facts noted in regard to the ocean depth at which life is found, and the erroneous idea which has obtained in regard to the uniform temperature of the deep sea:

"It was found that a difference in bottom temperature between 32° and 47° existed at points only eight or ten miles distant from each other, beneath an uniform surface temperature of ahont 52°; and that where this was the case in the cold area the bottom was formed of harren sandstone, mingled with fragments of older rock, and inhabited by a comparatively ecanty fauna, of an arctic or boreal character, while in the adjacent warm area the bottom surface was cretaceous, and the more abundant fauna presented character istics due to the more temperate climate. Hence an upheaval of a few miles of the sea bottom subject to these conditione would present to the geologist of the future two portions of surface, totally different in their structure, the one exhibiting traces of a depressed, the other of an elevated temperature, and yet these formations would have been contemporaneous and conterminons. Wherever similar conditions are found upon the dry land of the present day, it bad heen supposed that the high and the low temperature, the formation of chalk and the formation of sandstone, must have been eeparated from each otber by long periods, and the discovery that they may actually coëxist upon adjacent surfaces has done no less than strike at the very root of many of the customary assumptions with regard to geological time."

Measuring Vibrations by Electricity. Prof. Le Roy Cooley gives, in the *Journal of the Franklin Institute* for November, the result of some experimente upon the relations of tho tones of stringed instruments, carefully made in pursuance of previous hints of the possibility of determining them by means of electricity. The actual pitch of all the tones in nearly tbree octaves of the piano, were determined. We quote: "Tho vibrations of the wire are made to occur in a vertical plane opening and closing an electric circuit with corresponding rapidity, and a dot is made upon the moving paper at the moment when the lowest point in tbo vibration is reached. The experiment begins wben the wire is above its line of rest: the first dot, therefore, represents one-half of one complete vibration. Should the experiment end when the wire is at the highest point in its motion, the number of dots would sbow the exact number of complete vibrations made; but since it may end wben the wire is at any point of its path, there may be a possible error of less than one-half of a complete vibration in an experiment one second in length. As the time is lengthened, the error is diminisbed; in a registry of five seconds the maximum error would be less than one-tentb of one vibration per second.

The precision with which the laws of vibration may be verified by tbe use of this instrument is in the bighest degree satisfactory. However numerous the repetitions of an experiment may he, the registry varies only by a single dot. Moreover, it makes the law rest upon no comparison of eounde produced by the vibrations, nor upon any other effect of the motion, but upon the vibrations themeelves, wbose numerical relations are directly ehown. Vibrations, sonorous or otherwise, are thue equally the eubject of experimental inveetigation."

Hydrogenium Again.—The alloys of palladium with other metals, are aleo found to abeorb hydrogen when the eecond metal does not constitute more than half the mixture. The alloys all expand by the absorption, and afterward contract, as was tbe case with the palladium wire; but unlike that, they contract only to the original lengtb of the wire. The mean of eeveral experiments with different alloys gave 0.733 as tbe figure which ie taken provisionally as the approximate density of hydrogeninm,

Antiquity of Man—The Summing-up.

Dr. Karl Vogt, of Geneva, at a recent meeting of German naturalists and physicians at Innsbruck, summed up the result of the congress of palæontologists. We condense a portion of his remarks:

"There is no longer any doubt that man existed in Europe—probably the latest peopled part of tho world—at a time that the great southern animals, the elephant, the mammoth, rhinocoros, hippopotamus, were found there, which are now extinct. It is equally certain that posterior to the advent of man the straits of Gibraltar, of Dover, and the Dardanelles, as well as Sicily and Africa, were still united hy isthmuses; the whole Mediterranean area was separated from Africa hy a sea in the basin of Sahara; the Baltic was a sea of ice covering tho whole of tho low levels of N. Germany and Russia, and cutting off Finland, Sweden, and Norway, into what would have heen an island but for its junction with Denmark. The researches of Lartet in France, of Fraas in Germany, and of Dupont in Belgium, have proved that this period was succeeded hy another, in which men hunted in the countries of Central Europe tho reindeer and other arctic animals, in an arctic climate, and surrounded hy an arctic flora. Our primeval Europeane were savages in the fullest sense. They were cannibals, as has heen lately shown by researches in Copenhagen. The lake villages in Switzerland, on the other hand, show that agriculture and the pastoral life flourished whilst the metals were still unknown. It can he shown, moreover, that our civilization came not from Asis, but from Africa; and Heer has proved that the cultivated plants in tbe Swiss lake villagos are of African, and to a great extent, Egyptian, origin."

The "Meteoric Shower" of the August Eolipse.—Prof. Alfred Mayer thus remarks upon the bright points traversing the telescopio field of view during the eclipse of August last; which points were noticed and reported hy various observers:

"During the month of September, 1869, I was running a meridian line for the foundations and piers of the Sayre Observatory; and on the afternoon of two days, while taking altitudes of the sun with a theodolite, I observed bright, star-like points rush into the sun's image with ahout the apparent velocity of shooting-stars. The similitude to a meteoric ehower was perfect, even to the *trails* left by many, while others appeared to burn out hefore they reached the sun's limb. I immediately referred it to its real cause, viz: the flight of minute insects across the field of view. The supposition was confirmed, on withdrawing my eye from the ocular, by observing clouds of minute flies or midges, with thin iridescent wings, flashing in the light of the sun. Although more of interest to naturalists than to astronomers, I will add tbat on two evenings of the past week while examining the moon, hetween the hours of eight and eleven, I have seen birds crossing the moon's image, (which entirely covers the field of view,) at the rate of about eigbt in a minute. They were all going eastward."

Alloys Chemical Compounds.—A mixture of bismuth, lead, tin and cadmium, in the proportions of 7½, 4, 1½, and 2, melts at 151° Fah. Bismuth alone melts at about 500° Fah., lead at 600° or more, and tin at 440°. The *Boston Journal of Chemistry* says: "The fact that the melting point of tbe alloy is lower than that of any one of the ingredients, goes to show that alloys are, in some cases, to be regarded as chemical compounds, and not as mechanical mixtures. Other phenomena confirm this view; as the evolution of heat, when certain metals are melted together, and tho fact that the density of an alloy is not what it should be if the metals are merely mixed."

Duration of the Spark.—The time occupied by the electric spark is estimated by Mr. Wbeatstone uot to exceed the millionth part of a second. Yet a distinct photographic image ie obtained by it. A vein of water issuing from a small orifice, which appears to the eye as emooth as a stem of cryetal, if seen or photographed by the light of tbe electric discbarge, ie shown to he composed of drops variously disposed, and of varione forme, some being elongated, others flattened, and others almost spherical.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

AMADOR COUNTY.

Kennedy.—*Ledger*, Dec. 18th: Work is being vigorously pushed on this mine under the new arrangement, and we learn that a vein of excellent quartz has been broken into within the last few days.

NEVADA COUNTY.

Perrin's Mine.—Grass Valley *Union*, Dec. 15th: Perrin's mine has not been worked for the past month. Yesterday the repairs were completed and the mine started up.

Departed Glory.—The big cylinder of the Rivot sulphuret works has been broken into small fragments, to be recast into useful articles at the Nevada foundry. It took 12 yoke of oxen to bring that cylinder from Colfax, and very little giant powder to break it up. The company to which it belonged was broken before.

Allison Ranch.—Same of 16th: Two hundred tons of rock from this mine has yielded $6,600, or $33 per ton. This is from the old "backs" of this played-out mine.

Idaho.—We yesterday saw a bar at Findley & Co's, from the sulphurets of the Idaho, valued at $2,700.

From the Ridge.—Same of 18th: At North Bloomfield, the Gravel Co. are getting everything ready for water. They have two Craig globe nozzles, which will pass 1,100 inches each. R. C. Black and others are also making all their preparations for work. In Eureka, the snow is 10 inches deep. Times are quiet; most of the mills have shut down for the winter. The Mutual, and Black & Young's are the only ones now running. The Mutual has a large ledge and the rock is good. At the Black & Young mill last week, thieves succeeded in tearing up and getting away with the copper plates, which were in the sluices in front of the mortars. Mr. Black thought about 150 ozs. of amalgam were taken. The Birchville mine has closed for the season. They have an incline of 30 ft. running down to their ledge, and will resume work early in the spring. The Erie mine (the mill of which was burned during last summer), is idle, no work being done on the ledge. Rock taken out just before the destruction of the mill paid well. The Starr mine is looking well; parties are taking out rock, and the mill will soon commence running. At Cañon creek, the Gravel Co's dam is 60 ft. high, and as strong as timbers and bolts can make it. Three large iron pipes pass the water down to the head of the ditch, and are calculated to be of the capacity of 10,000 inches at 40 feet pressure. Work will be resumed at this point early in the spring, and the height of the structure increased five feet. At the proposed height the reservoir is calculated to hold sufficient water to run 3,000 inches day and night for four months.

New Diggings.—Same of 19th: It is reported that Jos. Gillwater and others have discovered rich gravel diggings two miles west of this place, to the north of the Rough and Ready road. There was considerable talk in town yesterday about it.

Relief Hill.—*Transcript*, 18th: We understand that the prospects for mining are very encouraging. Six claims are now being worked, and three of these are running tunnels, preparatory for work next spring. There are some fine claims in this locality which offer splendid opportunities for men of small capital.

Mining at Omega.—Same of 19th: Kidd & Co., having purchased the claims formerly owned by Dr. Teeple, have been preparing for work. One set of claims are now running, and others will be started soon. On Saturday a blast of 106 kegs of powder was discharged in one of the banks, which did excellent execution.

Mining at Chalk Bluff.—*Gazette*, 16th: Hussey Brothers have just completed fitting up their hydraulic claims and are ready for water. They have three pipes, with 2½ inch nozzles each. They will use 300 inches of water.

Quartz Location.—W. W. Nichols & Co. have located 4,000 ft. on a quartz ledge one mile north of Columbia Hill. The rock prospects $35 a ton. The owners are taking out rock sufficient for a milling test. The ledge is three feet wide, and is supposed to be an extension of the Grizzly Hill ledge.

Waiting on the Weather.—Miners were never better prepared for extensive operations than now, but for want of rain they are generally idle.

Magnolia Ledge.—J. F. Carr, owner of the Magnolia, at Willow Valley, who has been running a tunnel from Mosquito creek, has struck the ledge. It is from three to four feet in width, and the rock looks fine.

Nebraska Lead.—Same of 20th: The Kansas Co., who are running for the old Nebraska lead, are cutting a drift in the granite to get under the center of the channel. The Harmony Co. expect to resume work soon, and the Cold Spring Co., whose claims adjoin the Harmony above, had workmen employed last week in leveling off the ground with the view of starting an incline.

Resumed.—The West Eureka Co., at Pie Plant Ranch, supposed to be the extension of the Eureka, have erected machinery for hoisting and pumping, and resumed work on Saturday.

Patent for the Idaho.—The U. S. Patent for the Idaho mine was filed for record in the Recorder's office yesterday. The patent embraces a tract of seven acres and eighteen hundredths, and extends thirty-one hundred feet along the ledge.

Rich Specimen.—Same of 21st: We were shown yesterday, at the Bank, some fine specimens of gold-bearing quartz from the Banner mine. The rock is literally seamed with gold.

YUBA COUNTY.

Brown's Valley.—*Appeal*, Dec. 15th: It is well known that the Rattlesnake mine and mill have been closed for nearly two years; having been sold by the Sheriff at that time to Prescott & Scheidel for $1,600 to satisfy judgment. Within the last few days, George J. Bonroe and others leased the mine for three months, without consideration, and before they had succeeded in fully ridding it of the long accumulating water, they discovered a ledge of 20 inches in width which yields $40 to the ton. The new strike has given a fresh impetus to the Brown's Valley mines. The Sweet Vengeance mill is in operation. The Donnebroge mill is working rock from another mine in the valley, and paying tolerably well. The prospects brighten.

Brush Creek Quartz Mine.—This mine, during the last run of 90 days, reduced 1,105 tons of quartz, realizing $48,394.08, equal to over $41 per ton.

Arizona.

Plenty of Water.—Prescott *Miner*, Dec. 4th: Everything is wet. From this time to May we may count upon plenty of water. Many placer miners have already gone to work.

Big Bug.—The mill is still idle, but plenty of rich ore is being taken out. Placer miners were preparing to go to work.

Wickenburg.—A private letter says that the Vulture Mining Co's 40-stamp mill commenced work on the 28th.

Charles Otten, a miner at work in a gulch in Hassayampa district, found, one day last week, a piece of gold worth $18.

Sterling.—C. V. Beseler, the new superintendent, will start the mill in a few days.

Upper Lynx Creek.—A party of miners came to town on Wednesday, purchased supplies, and paid with gold dust. We learned that they had been making small wages with a rocker, on a bar below the cañon. They started back the same evening, and are by this time at work with sluices, by which they expect to wash out five or six dollars a day to the man.

Lower Lynx Creek.—Placer mining will soon be brisk. The Bashford Mining Co. will start in next week, and work will also be resumed in Jacksou, Lovejoy & Co's hydraulic diggings. Jos. Revoirs & Co. have already started to work. The Mexicans, at work near the old camp, are doing well.

Uncle Billy Pointer.—This old pioneer is going to start his arastra on Lynx creek. He is over 60 years of age, and will, we are glad to say, succeed in making a home strike this winter. He has got a rich ledge.

Colorado.

Mining Items:—Georgetown *Miner*, Dec. 9th: The Malahar lode has a solid vein seven feet wide and yields 50 per cent. lead and $60 per ton in silver. It is owned by a Chicago Company....The whole ore vein of the Comstock lode, Summit county, yields 25 per cent. lead, and the first-class portion of it 75 per cent.....The shipments of first-class ore from the Terrible mine have averaged one ton per diem for the last two months....On the Par lode, the shaft is still going down, and the vein increasing in width and richness. Mr. Brown made an assay of first-class ore that gave $9,308 per ton.

Tunnels.—The Burleigh drills can be heard night and day in the Goss and Burleigh....George Barrett is pushing things on the Helmick....Work is progressing finely in the Linn....The workmen on the Marshall are tearing into Leavenworth Mountain....A new tunnel has been located on Griffith Mountain for the purpose of cutting the Comet lode.

Idaho District.—The main shaft on the Franklin is 135 feet down. There is 90 feet of stoping ground. There are 800 tons of $75 ore out. A good wagon road has been constructed. Timber is abundant. The ore is crushed by a five-stamper, each stamp weighing 750 pounds. The furnace, a double reverberatory, is 18 feet long, and 11 feet wide. With all the drawbacks of a first trial run, the yield of the first seven tons treated was 697 ounces, 508 fine, coin value, $457.78. The Co. own in four different lodes. The whole cost of work done aggregate $30,000.

Briggs Mine.—Central City *Register*, 9th: The chunk of gold on Hussey's counter yesterday was in the shape of a sugar loaf, weighed 500 ounces, and was worth $10,000. This represents the net proceeds of the Briggs mine for one month, and is from second-class ore.

Items.—The Plumb Brothers are doing first rate with their new mill....The Winnebago mill is doing good work on Prize ore....The Coaley mine is yielding brittle silver in chunks as large as a man's fist. ....Work is about to start up on the Sparks lode, Nevada. It will be continued all winter, and in the spring a mill will be erected. The shaft is 80 feet deep and the vein is 18 inches wide.

The company owning the Prize lode is negotiating for the erection of a mill early in the spring at Black Hawk.

Idaho.

Items.—*Wave*, Dec. 9th: It is rumored that the crushing of ore from the Twilight mine at Black's mill gave $1,800 from 16 tons....Same of 16th says: The Schoenhar mill will start up on Baxter ore as soon as sufficient snow falls to enable teams to haul the rock.

North Idaho.—A correspondent of same writing from Warrens' diggings says: Quartz mining is at a stand-still, owing to constant litigations. The average yield of all the rock taken out has been $43 per ton. Our placer mines continue to yield fairly, the side claims paying well, the middle of the creek having been worked out. The camp will be open for Chinamen next spring. A new camp has been struck 10 miles north, which promises to be as rich and extensive as this has been. It is so late in the season that little can be done until spring. The claims that have been opened are considered to be good $20 diggings to the hand, when water is plenty.

Montana.

Gold Yield.—Virginia *Times*, Dec. 8th: The result of the runs on the John How mill at Summit is satisfactory. The Polar Star, Chickaman and Nelson lodes, upon working tests, have yielded respectively in the order named, $12 to $13, $9 to $10, and $20 to $25 per ton, and all show good width of vein and almost uniform quality of ore. No essay has been made as yet.

Connor Mill.—The Tom Connor mill, in Brown's gulch, has just completed another successful run. From 10 tons of ore from Christnot's lode, an amount of retort was realized that we hesitate to mention until an assay shall give us positive figures. Enough has been proven by actual working tests, to warrant us in believing this to be the richest silver district in the United States.

Pilgrim Bar.—*Independent*, 4th: Catching, Smith & Co. worked to the 25th ult., cleaning up for the last six weeks' run over $14,000, of which over $9,000 was net.... Last week Mr. Walker sold his mining interest to Con. Kohrs and Wm. Fly, for $6,000, gold.

Items.—Helena *Gazette*, 4th: Deeper and richer deposits have been discovered in Last Chance Gulch, and it is believed the thing is very extensive....At Blackfoot, most of the claims are closed for the winter. ....A new lode has been discovered in Dry gulch by the Wainscott Bros. The ore resembles the croppings from the Union, and is 20 ft. wide. The quartz men are on the lookout, and we are told that one gentleman has offered to erect a mill for an interest in the lode, giving the discoverers an equal interest in the mill.

Highland Gulch.—Cor. of *New Northwest*, Dec. 3d: The estimated yield to date is $250,000 from placers, and from quartz $50,000. The gold is the finest in Montana, assaying .994. There are five bedrock flumes in operation and being built. Forty quartz leads are recorded in the camp, three of which—the Ballarat, Nevius and Only Chance—have tunnels to them over 400 ft. long. The deepest shaft is on the Only Chance, 220 ft. There is one quartz mill—Prof. Swallow's; arastras, six, all of which have paid, we are told, but are now idle. The mill will probably start shortly. Four quartz leads have paid well.

Rochester Gulch.—In the spring of '68, Hendry & Woodruff, of Helena, erected a 10-stamp mill at a cost of $8,000 on the Watseka lead, from which they continued to crush until the spring of '69, the ore averaging $30 per ton. For some cause, the mill has been idle most of this summer. The report is now that it will soon resume.

The Madison Co. removed their 10-stamp mill from Hot Spring district to Rochester in the spring of '69. Its cost was about $10,000. It has been running almost constantly on Watseka, Julia Holmes and Niff ores, turning out from $300 to $1,000 per week.

There are three arastras working in the district, and the gulch (eight miles long) is demonstrated to contain wages diggings at least. A drain ditch 1,200 feet long has been run and bedrock struck at a depth of 40 ft., on a high point, prospecting rich. Sluicing will be begun next spring. The quartz of the district is rich.

Cedar Creek.—Same of 10th: A Missoula correspondent says: A big stampede is now going on at Cedar Creek, which runs into the Missoula river, 60 miles below here. The mines are up the creek 12 miles and are said to be rich. The creek has been prospected for 10 miles, and 25 cents to $2.50 to the pan has been found the whole distance. Sixty claims below and 30 above discovery were staked at last accounts. The gold looks like that from Kootenai.

Philipsburg.—Cor. of same: Rock coming out fast; enough in sight on Ullery & Merrill's 50 ft. to run a ten-stamper a year in everybody's opinion. The Sanders outfit have opened two ledges very finely, and are at work on the third and fourth with increased energy. Sanders is expected from California and Nevada the coming week with balance of the machinery.

Nevada.

COPE DISTRICT.

Mountain City.—Cor. of Elko *Independent*, Dec. 18th: The difficulty in the Mountain City Co. has been amicably adjusted. Work has been commenced in earnest, and in one week this mine will be able to furnish ore to keep the 10-stamp mill of Atchison & Drew constantly employed. The mill has been crushing ore from the Hamilton mine, 30 tons of which yielded 130 pounds of bullion.

A shipment to San Francisco of several tons of ore from the Crescent yielded $300 a ton.

Work progresses on the Argenta, Keystone, Belle of the West, and other mines.

Wyoming District.—We understand that a sale has been made of 100 feet in the Primrose ledge, to parties from below, for $800. The ledge is comparatively unprospected, but presents evidences of wealth on the surface. Some 2,000 pounds of ore from the Bruno ledge were received on Monday, for shipment to the Auburn mill, near Reno.

HUMBOLDT.

Battle Mountain.—Cor. of *Register*, Dec. 18th: Our mines are looking better every day, and lots of ore exit below have yielded satisfactory results.

Denton & Co. have discovered a rich galena ledge a mile east of town, supposed to be an extension of the Cherokee. The ore yields high, and the ledge is large. Near Butte mountain, Leidolph & Co. have opened one of the richest copper ledges in the State.

Butte Mine.—A shaft 60 feet deep has been sunk, and the ledge is six feet wide, three feet of which is ore. One hundred and five tons of ore from the drifts, worked at the Little Giant mill, yielded 435 pounds of fine bullion.

Railroad District.—Elko *Independent*, 18th: The Mammoth ledge is 30 feet wide, and yields ore, pieces of which will in a furnace turn out half their weight in copper, and more or less gold. The Rainbow and Maria Louisa ledges are considered first-class by all who have seen them. Railroad District is looming up.

REESE RIVER.

Lander Hill.—*Reveille*, 14th: During the past few days very rich ore has been developed in the Semanthe mine, owned by John Craycroft.

Mineral Hill.—*Enterprise*, Dec. 17th: A gentleman just in, informs us that the principal leads are looking better than ever. They have out a considerable amount of ore that will pay $500 per ton. A 10-stamp mill will soon be in operation.

Shipments of Ore.—Elko *Independent*, 15th: The average pulp assay per ton of ores shipped by Mineral Hill Co. is $483.

The Spencer Co. has shipped 13,100 pounds assayed value $307 per ton; hy Alta Co., 12,332 pounds, $292 per ton; Troy South Co., 2,420 pounds, $530.22 per ton; Austin Ledge Co., 12,656 pounds, $440.63 per ton.

The amount of ore on the dumps of the Spencer Co. is 200 tons, estimated to be worth $150 por ton. Ward & Co. have 500 tons which will average $250 per ten. There have been gathered from the hill about fifty tons of float rock and shipped to Austin, which averaged $150 per ton.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, 18th: The general prospect looks something gloomy, occasioned by the break of the leading companies, this week, by which a considerable number of men were thrown out of employment. The mines look as well as ever, and most of them better. The weather is favorable, and the mills are making good returns. The Consolidated Chloride Flat quit work Tuesday, on an order hy telegraph from San Francisco. The Aurora Consolidated and the Treasure Hill S. M. & M. Co: reduced their force

The Consolidated Chloride Flat is in the midst of a negotiation with other corperations. Ono is a mill affair, the other is to some extent the samo interest, hut identified with a large mining interest on the hill. A conselidation of iuterest is anticipated, which may be effected any day. * * We are inclined to bolieve that the persons holding the bulk of steck in all tho interests involved have an understanding, which is to depress mining interests on the hill.

The *Empire* says: We can assure our readers that the mines never looked hetter. Tho stoppage of work ou the Consolidated Chloride Flat had the effect to temporarily cast a gloom over the district; but when we have so mauy respectable mines that have merely been touched, and the promise of permanent ledges, rich in mctals, in every direction, we need horrow no trouble ahout the closing of the undergreund works of ouo company.

BULLION.—The shipment for the past week for some reasen has been very small, the total being but $32,269.05. Although there is now in tho office of Wells, Fargo & Co., ready for shipment, five bars valued at $6,843.59, we know of a large amount of bullion still remaining at the different mills.

The *News* makes the total amount aheut $1,500 more.

MILLS AND FURNACES.—*Empire*: The Chicago mill will be in operatiou hefore the 1st of January. It has a rock breaker which will hreak up a ton evcry five minutes....The Treasuro Hill mill has been repaired, and was again started up on the 6th, since which time five hars have heen taken out, value, $10,554.53. There still remains on hand $1,200 in amalgam. The company shipped ycsterday to Chicago seven bars, valued at $13,234.60. They now have on hand ore and material enough to run steadily through the wiuter. Their meuthly expenses will he less than $5,000. Mr. Field informs us that the Co. have shipped since Septemher 27, sixty-four bars, valued at $112,009.55....The Wilaud furnace, in the gulch below Maiu strect, was started up on Tuesday, and in thirty-six hours ten tons of lead bullion were smelted out and run into bars. The ore heing reduced is from the Imperial, Miser's Dream and Blue Cloud, which yields about fifty per cent. in bullion —composed of silver, lead and copper. The bullion will yield $100 per ton in silver. This and several other furnaces have now stopped on account of the burning out of the lining. They will soon start up again, The Wiland will have two to run alternately....The Swansea mill is again at work on Original Hidden Treasure ore.

ITEMS.—*News*: Eberhardt shows immense fields of ore in every direction in the Keystone....Original Hidden Treasure looks hetter than ever....Odin is a promising mine—has a shaft 45 feet down, and ore which will work $70 per tou.....Joe Potts has sent 15 tous to mill....Stockholm has three shafts 125 feet apart. The ore will yield, at the furnace, about $70 to the ton. ....West California proposes to go down with the main shaft to the ledge....Work on Borealis resumed hy contract to Capt. Mallett, at $16 per foot....Flora is heing opened up for work.

ITEMS—*Empire:* Origiual Hidden Treasure has 9,000 tons of ore out, which will mill $25 to $30 per ton....Aurora Consolidated ships twenty tons to mill daily, has 2,000 tons on hand, and never looked so well as now....South Aurora yields thirty to forty tons daily of as good ore as any yet shipped....Consolidated Chloride Flat has shut down, although it had ore enough out to last all winter....Bullion struck rich ore on Friday at the depth of eighty feet.

Oregon.

RYE VALLEY.—A La Grande paper says the late quartz discoveries iu Rye Valley are creating excitemont—several ledges having been found that prospect well. The one known as the Monumental ledge assays fabulously. Some of the ore is puro —and a printed receipt from an assay office in Boise City shows $9,091 to the ten.

New Mexico.

MINING ITEMS.—Elizabethtowu *Telegraph*, Dec. 11th: The greater portion of Dimmick & Co's mill has reached its destination on Ohio gulch. Thirty men are employed in mill and mine....Crawford & McCallum have again commenced work on the Gladstono silver lode near Scratch gulch en Quartz hill....The Benjamiu lode is turning out hetter and better.... The discovery of a new lode, with a 3-foot crevice, in the Last Chance region, is reported.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Dec. 24, 1869.

W. T. Atwood states the following as approximate price at which copper ores can now he sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	25 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per uuit. Bars at the rate of 13c. per lb. for pure copper.

LOSS OF WEIGHT BY PERSPIRATION.—The loss of weight experienced by a rower, through perspiration in a prolonged contest like that of the Harvards with the Oxfords is from four to eight pounds.

San Francisco Mining Stock Market.

City Stocks.

The sales of miscellaneous securities in the Stock Board during the past week have been as follows: 15 shares Spring Valley Water at $61 75; 20 shares San Francisco Gas at $87 75, and 1 share California Steam Navigation Company at 47½ per cent.

The returns of our local insurance companies to the Internal Revenue Department for the month of November, and previously this year, have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77½ cents for February and March, 75½ cents for April, 73½ cents for May, 74½ cents for June and July, 74 cents for August, 74½ cents for September, 75½ cents for October, and 77½ cents for November.

	November.	Previously this year.	Total.
Pacific	$104,136	$1,093,555	$1,197,691
Union	40,609	402,657	443,266
Fireman's Fund	32,325	342,336	374,661
California	8,172	106,725	114,897
Merchants' Mutual Marine	31,243	257,873	289,116
Occidental	25,881	232,864	258,745
Home Mutual	15,328	146,851	162,179
Peoples'	22,314	183,039	205,353
Oriental	8,038	18,926	26,964
Total	$288,856	$2,794,826	$3,083,682
Same time in 1868	262,635	1,884,625	2,147,260
Increase in 1869	$26,221	$910,201	$936,422

The above statement shows an increase of $7,806 over the receipts in October. The receipts of the several companies in November as compared with October show the following difference:

	Increase.	Decrease.
Pacific	$3,085	.....
Union	8,952	.....
Fireman's Fund	.....	$3,654
California	.....	2,085
Merchants' Mutual Marine	.....	3,628
Occidental	3,591	.....
Home Mutual	.....	193
People's	2,192	.....
Oriental	1,006	.....

The receipts of the city railroads for the month of November and previously this year were as follows:

	November.	Previously this year.	Total.
Omnibus	$20,319	$246,378	$266,697
North Beach & Mission	21,168	245,357	266,525
Central	15,898	173,440	189,338
Front Street, Mission & Ocean	7,896	93,534	101,440
Market Street	9,439	117,404	126,843
Potrero and Bay View	2,356	30,549	32,905
City	5,259	18,865	24,124
Totals	$82,345	$925,527	$1,007,872
Same time in 1868	90,015	835,018	925,033
Increase in 1869		$90,509	$82,839
Decrease in 1869	$7,670	.....	.....

As compared with the total receipts in October, we find a decrease of $17,859. The receipts of November as against October show the following difference:

	Increase.	Decrease.
Omnibus	.....	$3,964
North Beach and Mission	.....	5,249
Central	.....	3,572
Front Street, Mission and Ocean	.....	1,721
Market Street	.....	2,151
Potrero and Bay View	.....	388
City	.....	504

Mining Share Market.

The market for mining stocks has been less active than the previous week, most stocks showing a recession in price. Information from the various mining localities is quite meagre, and this, together with the intervention of the holiday season of the year, has contributed greatly to the prevailing inactivity.

We have further information with regard to the stoppage of various White Pine mines, hut cannot agree with those who call it a hearing moving. If a sufficiency of ore is on hand to run the mills during the winter, as some are reported to have, where is the need to continue the heavy expeuse when it hears so hard at the present time? The true policy, certainly, is to avoid all unnecessary outlays when times are extremely pressiug, and this appears to he the condition which affairs have assumed in the White Pine region. The expenses are entirely too heavy, and some plan will no doubt he devised to hetter the mining interests there so soon as the winter is over. The White Pine *News* is of the opinion "that the mills, under a combination of mill, mine, and water interests, will generally he removed up to the hillside early in the Spring—to save hauling. In that case, local railroads will strap the slopes thick, and hauling will dwindle to a small interest."

GOULD & CURRY—exhibited a little more activity and was well maintained. The ore extracted during the week ending Decemher 20th amounted to 429 tons; previous week, 416 tons. We have nothing of interest as regards the upper chambers of this mine. The product so far has held out quite well. They resumed work at the seventh station at noon on the 20th inst. The hullion received to date for account of December aggregates $10,228.

CHOLLAR-POTOSI—was in the market to a very large extent, at a decline from prices obtained the previous week. For the week closing with the 17th inst., 1,029 tons of ore were extracted, against 997 tons the previous week. The change in the appearance of the stopes is not very great, and, upon the whole, look as well as they did last week. The work of clearing the Chollar-Potosi shaft has been vigorously prosecuted, and on the 21st they were nearly at the bottom of it.

HALE & NORCROSS—sold to a less extent than the previous week, though the stock rose to $159 on the 20th, closing at a considerably less figure. During the week ending December 18th the upper mine yielded 127½ tons of ore and the lower 804¼—total, 931¾; previous week, 853 tons. Information to the 21st is to the effect that on the 20th the water broke in on the track floor of the sixth level, but was speedily mastered, leaving the level as clear of water as usual, and that the ore breasts on this level continue to look very fine. They will soon be able to run two cages from this level, which will greatly increase the quantity of ore hoisted from this locality of the mine.—OVERMAN has been in comparatively light request, at a slight recession. For the week ending December 18th, 531 tons of ore were extracted, valued at $7,492 33—equal to $14 10 per ton. The bullion returns for November are given at $55,691.

A LIVERPOOL circular makes an appeal in favor of Crlifornia milk-wecd as a valuable addition to fibrous material, now so much in demand, and thinks it can be made a valuahle article of commerce.

Dew and Frost.

Every one has noticed how moisture collects on a pitcher of ice water on a hot day. The reason of this depositien is that the air in immediate contact with the cold pitcher becomes cooled to such a degree that it can no longer hold all the moisture it contains, and so the excess is deposited on the pitcher's surface; for it is well known that warm air can hold mere water than cold.

New just in the same way after sunset the earth ceols the air in centact with it, and this depesits seme of its water in the form of dew. This is plain enough. But some may not see the reasen why the earth becemes cool so suddenly after the setting of the sun. Se it may be interesting to pursue our inquiries a little further.

The earth, science informs us, is moving through a spaee whose temperature is at least 270° below zero (Fah.), and is contiuually losing heat by radiation. The enveloping atmosphere, like a blanket, protects it from the cold to a certain extent; bnt still the loss of heat is so great that, were the sun's rays withheld a few days, the tropics even would get as cold as are the poles in wiuter. Now in the daytime the earth receives from the sun more heat than it loses, but when the sun goes dewn, the loss of heat still ceutinuiug, the surface soons get cold and the dew falls; or, if the temperature gets below the freezing point, the dew is changed te frost.

The greatest depesition of dew occurs on clear nights, and in cloudy weather none is deposited. This is hecause the clouds reflect hack the rays of heat which the earth radiates forth. By spreading a piece of glass or auy covering over the ground we canin the same way reflect back the heat and protect tender plants.

More dew is deposited on grass and foliage—which, by the way, need this refreshing moisture—than on fallew land or on sand or rocks. It is easy to see that the most dew will fall on the coelest surfacc, and experiments show that the surfaces of leaves have a much greater radiating power than the rocks, for instance, and hence coel more rapidly.

There is ene more point which we may notice in this connection. When a liquid is converted into a gas it absorbs heat; when the gas is condensed hack again into a liquid, heat is given out. Now the sun expends some of its warmth in evaporating water, and this heat is not lost, but is given to the earth when the vapors condense and dew (er rain) fall.

How Stone Should be Laid.

[Written for the Mining and Scientific Press.]

All stone should he so quarried aud dressed that each block may lie in the wall in the same relative pesition that it held in the earth; that is, the side which was uppermest hefore quarrying should he also uppermost in the structure. Oue reason is, that the particles of the stone, as they crystallized from a liquid or a fused state, becamc so superposed that the general liue of pressure was iu the direction of gravity; so that if the stone is inverted or placed upon cdge, its particles begin to work upon each other in a different direction from the original one, and the consequence is, the stone crumbles or splits, and tho huilding is very likely ruined. This arrangement of the particles may be exemplified by a stone or brick arch: the hlocks rest one upon another, and all are held in position and tightened hy the wedge-shaped keystone; but turn the arch upside down, or on one side, and it no longer supports itself. Every good engineer and stone mason knows this fact and the importance of oheying this law of nature, hut many of your readers who pretend to be neither, may find this useful when laying stone for themselves, or in overseeing such work.

E. R. H.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

California a Wonderful Country.

The prolific climate of California is hardly yet understood, even by our own people, while it is still less known abroad. As an evidence of what *can* he done here, we would call attention to the following fact noted hy the Tulare *Times:* "Mr. J. B. Franz raised a fine crop of wheat on his place this year, and after taking it off, plowed the same ground, and is now eelling corn and tnrnips raised as a second crop. He has also a eecond crop of volunteer grain that is now getting ripe. We have in our possession a turnip, which was raised on thie farm, that measures twenty-eight inches in circumference."

In many parts of California continuous crops may he raised the year round, by careful culture and irrigation. The Chinese, and some others who carry on gardening in and about this city, fully under stand this fact. Within sight of onr residence, at the south end, is a large garden which has heen nnder continnous cultivation, with green crops, every month in the year for the last *seven years*—the entire time we have resided there. It ie leased and cultivated by Chinese. As eoon ae one crop is taken off, the ground is thoroughly dressed with manure, and another is put in. It is so managed that ripe crops are dsily coming in, and new ones being planted. Where else in this latitude can such a thing be eeen?

In this connection, we cannot refrain from quoting the following paragraph from the pen of an enthusiastic writer, who epeaks of California as a land "where the plums are without curculios, the wheat fields without weavil, the farms without need of barns, and the cocooneries without fesr of storms; where the ox needs no fodder, the ass no crib, the calf no etall, the lamh no shepherd's care; where the hees yield more honey, the worm more eilk, the kine more muscle, the sheep more wool, the vineyard more wino, and the fields more grain than anywhere else; where the olive and the apple grow side hy side, and the fig tree and the pear intertwine each other's branches, and the rose opens its petals both with the earliest tulip and the latest dahlia; where Christmas is as fragrant as May day, and annnale become perennials, and perennials evergreens; where exotics become naturalized, and the winter wheat of one year becomes the epring wheat of next; and trees which, had they grown on Mount Olivet, might have witnessed the Savior's agony, and accompanied him in his ascension three hundred feet in the fields of light, etill flourish; where the rocks are rich in treasure, and the streams roll down golden sand; where nature moves even volcanic forces in most poetic moods, and molds caves and chasms, and bridges and cataracts into forms eo suhlime and pictnresque as to even make the atheist pray, and the mathematician tune the lyre; where the refreshing night of the temperate zone, married to the luxurions deep of the tropics, makes the outgoings of the morning and evening to rejoice; where dimes are despised and coppers unknown; where greenbacks are eold hy the package, and rich men are democratic and poor men aristocratic; where, withal, prosperity ie protected, intelligence diffused, and Christianity adopted."

The above, extravagant ae it may seem to one not acquainted with our climate and soil, is true to the very word and letter, and yet the half has not been told.

Stall Floors.—A stall floor should have hut very little inclination, just sufficient to allow the urine to flow slowly away; better that absorbents should be used for taking it up. Animals suffer much by standing on a floor eloping back. Let a pereon stand for a fow moments with his toee higher than his heels, and he will fully realize thie fact. Animals endeavor to relieve themselves of this unnatural poeition by standing crossways of their stalls, and hy hacking as far as possible, hoping to find a level in that direction.

Improving Our Native Chestnuts.

Much interest has been excited in this State, within the past two or three yeare, in regard to the oultivation of the chestnnt. The excitement was started here hy the exhibition of eome very large nuts of this kind from Japan, aud during the past season a large invoice of Japanese chestnut trees was received in this city, and forwarded to the vineyard of Mr. Buckhee, ahove Coloma, from whence many of our ranchmen have been supplied.

The appearanoe here of these nuts and trees has led to a discuesion of the relative valne hetween our native chestnut and the foreign vsriety. It is conceded on all eides that the European chestnut ie quite inferior in *quality* to our native varieties, although it hae much the advantage in *size;* and henoe it ie inferred that we should he oautious ahout introducing.here the mammoth Japaneee varieties, the quality of which has not yet been fairly placed in comparison with our own. It is olaimed that hy a little care in making selections, we shonld he ahle to produce from onr native varietiee, nuts, almost, if not qnite, equal in size to either the Enropean or Japanese, and much euperior in quality.

Every one who has ever taken the trouhle to examine the nuts of different trees in the same forest, must have noticed the great differenoe in form, color, and size; and ss these charaoteristics oan he readily perpetuated hy the usual method of hudding and grafting, there is no good reason why we should not have permanent varieties of the native chestnut, as well as of apples and pears. Of course seedlings should he grown from the very largest nuts to he found, and then again selected from these in the same way when they come into hearing.

About tweuty-five years ago, a gentleman in Washington, D. C,, sent Mr. Charles Downing a few specimene of very large native chestnuts, a few of which he planted; and a tree grown from one of these nuts is now standing upon the lawn of the Downing place at Newburgh. This tree has frnited for several yeare past, and produces nuts, which are very large and fine, ehowing that they have not degenerated, hut are equal, if not superior, to the original.

There seems to he, just now, a plentiful supply of Eastern nut seeds, with which our ranchmen can snpply themselves. Mr. J. A. Kent, of Greenville, Mercer county, Penn., has recently arrived at Sacramento with 5,000 pounds of fresh chestnuts, gathered expressly for seed, and with the idea of introducing them into the nurseries of California.

The *Union* of Grass Valley, saye that A. D. Tnttle, who recently returned from a visit to the East, brought with him a large supply of oheetnuts, hickory nuts, walnuts, and other eeeds of trees, which he is distrihuting gratuitously to all who wieh to plant them.

As an evidence that onr people are moving in the matter of forest tree planting, we eee in onr exchanges frequent notices like the following, which we clip from the Oakland *News:* "James Stratton, Esq., has just pnrchased some fresh chestnuts from the States, and English walnuts from Los Angeles conuty, which he intends to plant on his land at Berkeley. This is an action which we can readily recommend othere to imitate. He that grows a tree is a friend to posterity, and in the act he beautifiee and adds value to his own property."

The Grase Valley *Union* offers the following as a "free suggestion in this direction:" "The railroad acroee the continent being finished, it is easy now for our farmers to get tree seeds from the East. We suggest that the chesnut and chinquagin will grow in theee foot-hills with great rapidity, will hear a most profitahle crop of nuts, and will fnrnish the most durahle timber for fencing or for building purposes. It is just now the time for planting. We have all done too much talking about the capabilities of our foot-hills, and have tried too few experiments in nut-bearing trees especially."

There ie good reason for believing that in a few years California will have all the treos growing upou her soil which are of use for nut-hearing and for mechanical and fencing purposes. Those who do not embrace the present opportunity to properly stock their ranches with forest trees, will soon find them unsaleable and unprofitahle hy reason of the superior advantages presented hy the ranches of their neighbors, who early heeded the advice to *plant trees.*

Phenomena of Plant Growth.

It is interesting to uotice, and important to study, the various modifications induced in the habits and growth of plants, hy changes of climate, and careful or modified culture. Such modificatious often culminate in the production of permaneut varieties.

A cultivator of melons in Alabama has been experimenting with his vines, uutil he is now rejoicing in his ability to produce two orops in one season from the ssme vines. He cuts his vines back quite severely, after the first crop has been gathered, when, from the old stumps, *new vines* are started, from which ho gathers a *second* crop.

This, of course, can be done only whero no frost interferes between the first and second crops. Snch results are not new to florists. In countries where no frost interferes with the labors of the cultivator, all the members of tho melon and squash family, as well as many other anuual plants, may, with proper care and culture, he made perennial. This, in some cases, would probahly have to be doue at the expense of maturing the seed.

In California, such things are quite commou, even in the uatural growth of plants. Here the castor bean, an annual elsewhere, becomes naturally a perennial, and will grow to the size of a tree, twelve or fifteen feet in height, with a trunk six or eight inches in diameter. Several of the annual flowering plants become perennial here. Among others, we may mention the common "Four O'clock," which is said also to form here a bulbous root.

One of our exchanges, during the past week, referred to an instance of this kind, now to he seen in Santa Clara county, as follows: "Two miles west of Gilroy, among the foothills of the Coast Range, B. C. Bahb planted, four years ago, two hills of Lima heans on the eouth side of his house, and trained the vines over the door for ornament. Those same viues have grown on and continued to hlossom and produce seed every successive seasou eince. The trunk steme for some distance from the ground have hardened to the consistency of wood, and the process of lignification is apparently extending upward through the whole vine."

Fruit Crop of 1870 to be Small.—A correspondent of the Boston *Journal of Chemistry* expresses the opinion, pronounced reasonable by that journal, that the next crop of fruit in New Eogland will he small, for, owing to the great gale of Sept. 8th, the trees have bloomed out of season. The fruit buds of deciduoue trees, as well as the leaf buds, are *formed* in August and *matured* in September, and although their covering is sufficient to withstand the winter'e cold and storms, the powerful wrenching received before they were ripe may have broken the envelope, so that these buds also were forced into premature development by the active circulation.

Painting Rats.—A Connecticut man saye his way of driving rats from his premisee is to catch one, dip it in red paint, except the head, and let it go again. He finds this plan effectual.

Apples in San Diego.

The people of San Diego are discuseing the feasihility of raising their own apples, iustead of ohtaining them, as they now do, from this portion of the State. Recent experiments have ehown that the apple hae a much wider range than has generally heen eupposed, aud we have little doubt that certsin varieties might thrive as far south on the Pacific coast as the territory of this State extends.

A correspondent of the San Diego *Union* says that only two experiments have heen made with the oultivation of the apple in that county—one by Capt. Wilcox, and the other by himself. Iu speaking of his own trees, which we judge were set out last fall, he says the growth has been good. He very properly advises careful setting and cultivation; allowing the branches to start low. The latter precaution will he especially necessary to prevent the heat of the sun from injuring the trunk. The experimentor should not he eatisfied with partial success, but strive to do hetter; neither should he he discouraged hy a single nor many failures. Care should be taken in the selection of the troes, and different varieties should he tried, to ascertain those best suited to the climate.

The *Red Astracan* is found to do exceedingly well in the eouthern Atlantic States, and would probahly do as well as any in the southern part of this State. The success of the recent experiments in the Statee bordering on the Gulf of Mexico, is quite sufficient to warrant careful trials in San Diego and Los Angeles counties. Summer or early varieties will probahly succeed best. Our friends in that latitude can hardly hope to sucoeed in raising apples that will keep far into the winter.

Testing Seeds.

It is often of much importance that the farmer should know, quite accurately, what proportion of the eeed which he is ahout to plant will germinate; or to teet, in eome convenient and ready manner, the extent to which seeds have deteriorated hy age, or been adulterated hy fraud. The Royal Horticultural Society of London recently appointed a committee to investigate this suhject, which committee has reported that they "have under consideration the various modes of testing eeeds which are known to them; and that they feel iuclined to recommend as, on the whole, the easiest, oleanest and least troublesome, the placing of the seeds hetween moist flannel, and keeping them in the temperature of a kitohen or eitting room for a few days." This, of couree, is not equal to Nature's own test—actual growth in the earth; hut it answers properly for most kinds of seeds; and any eced that gives a good return uuder it may be depended on as certain not to give a worse result when placed in the ground. An idea of its efficiency may he inferred from a trial made by one of the committee upon 100 seeds, whoso average of good seeds had, in previous trials, heen found to he 75. The above method gave 25 seeds germinating on the third day; 23 on the fourth; 16 on the fifth; 9 on the sixth; and 3 on the seve nth—76 in all.

The Way to Farm.—If a man wants to succeed in his husinese he mnst have faith iu it as a business that will enstain him, and provide for his old age, and afford a comfortable support for his family. That is what we want to see among farmere. When the man who drives down the etake feels that it is driven for life, when he feels that every tree he plants ie to he a strong bond to bind him to that epot for life, he will thrive hy farming; and when farmers do this they will show to the world that they have faith in their business, and they will be ready to make investments in their bnsiness.

Grinding Hay for Feed.

Grinding hay for cattle feed was first introduced by Mr. Ross Winans of Baltimore—tho man who first built cigar steamers, coal-burning locomotives, and railroad batteries, and who has more recently distiuguished himself hy huilding gigantic railroads for the Emperor of Russia. He once essayed to foed a herd of eows; bnt even in such a commonplaco operation as that, his originality of thought eropped out in tho usual extraordinary manner which attends all his undertakings. In thinking over tho matter of his new husiness, he arrived at the conclusion that stall feeding was hetter than field grazing. The following was

His Argument for the Theory.

"In pasturage, a vast amount of herbage is trodden upon or polluted; this is one sourco of loss. At some seasons of the year tho grass is rank and full of moisturo; at once unhealthy for the cow; and not economical for consnmption, since it is prevented from ever reaching a much more valuable stago of growth. The stock, moreover, must travel over a greater or less area to gather their food for themselves; they are exposed to burning suu and driving storms; they often eat the grass soaked by rain or dews, and unfit to afford the fullest amount of nutriment. I can cut my grass cheaper hy machines with horse power, than to use the teeth of my cattle for the purpose. I can cut it *all;* there will he none crushed ont or defiled. I can select just that condition for cntting; in wbich the fullest amount of nntriment will be contained in the stalks and leaves, after the first succulence of spring is past, and before the juices have gone forward to ripen the seed."

Having thus settlod the point in favor of stall feeding, and accepting the eondition of feeding hay chiefly, be next concluded tbat it it was cheaper and better to masticate the hay by machinory ,than compel the cows to continue on in the old way of the muscular and molar process. Upon tbis he argues as follcws:

"Cutting did not seem fully to meet the exigencies of the case; the important matter being to disintegrate the fodder hy brnising, breaking, crushing, tearing, etc., and not by simply dividing it into shorter lengths. Indeed, when coarse hay is simply cut, he doubted whether the animal could masticate it to the same advantage as when uncut; as it would then slip around in the month instead of being held and crushed by the teeth. He wanted to do for his hay just what the English and Scotch do in feeding oats—crush it so as to be thoroughly accessable to the moisture evolved in mastication or to the water used in mixing it witb other food."

This course of reasoning soon led Mr. Winans to the

Invention of the Hay Grinder,

By which he was enabled to so "masticate" his hay as to bring it into a condition mnch resembling ground oats, in wbich form it might be mixed witb ground grain, or fed separately, as was found desirable. We have no description of tho apparatus employed for that purpose; but we have tbe statement that tho operation of grinding was effected at a cost of about ono dollar a ton; steam being used for power. Tbere are now, we believe, quite a number of parties in the Middle States, and perbaps elsewhere, who are feeding ground hay; among others, Mr Joseph S. Kirk, of Pittsburg, Pa., who speaks bighly of his experience in its use.

The ground bay was fed to tho cows in two different ways. About one and a half busbels per day per cow was wet with water or distiller's slop, and mixed with six quarts of corn meal. Tbis quantity was divided into tbree feeds. Then, in a separate compartment of the feeding trough, dry gronnd hay was given to tbe full extent tbat each cow would eat, which probably averaged about one hushel per day. Its weigbt was about eight pounds per bushel when of best quality.

The Result of the Experiment,

As reported at the time, fully realized his most sanguine anticipations, and the ecocomy and practicability of the same was thoroughly tested by tho fact that ou the first year, from 700 acres of mowing land, 300 cattle and 30 horses were kept tho year through, with 320 tons of hay to spare at the end of the year. The milking cows, over 200 in number, averaged for tho year two and one-tenth gallons of milk each per day.

Preserving Apples, Pears, Etc.

Next in importance to growing our hardy fruits may ho ranked the preservation of them for winter use, whether by amateurs or professional gardeners. In tho month of February last, a few prizos offered at one of tho Tuesday meetings at South Kensington brought together a considerable quantity of apples and pears from various exhibitors; and this fruit was in so excellent a state of preservation, that the mode of keeping iu the different cases were inquired into. The following is a *precis*, published by the Royal Horticultural Society, of the communications received:

1. As tho flavor of fruit is so easily affected by heterogeneous odors, it is highly desirablo that the apple and pear room shonld be distinct.

2. The walls and the floor should be annually washed with a solution of quicklime, to which common salt is sometimes added. [Salt is objectionahle.]

3. The room should be perfectly dry, kept at as uniform a temperatnre as practicable, and be well ventilated; but there should not he a thorough draft.

4. The utmost caro should be takeu in gathering the frnit, whicb should be handled as little as possible.

2. For present use, the fruit should be well ripened; hut if for long keeping, it is better, especially with pears, that it should not have arrived at complete maturity. This poiut, however, requires considerable judgment.

6. No imperfect fruit should be stored with tbat which is sound, and every more or less decayed specimen should be immediately removed.

7. If placed on shelves, the fruit should not lie more than two deep; and no straw should be used.

8. Where especially clear and beautiful specimens are wanted, they may be packed carefully in *dry* bran, or in layers of *perfectly dry* cotton-wool, either in closed boxes or large garden-pots. Scentless sawdust will answer the same purpose; but pine saw-dust is apt to communicate an unpleasant taste.

9. With care, early apples may be kept till Christmas; while many kinds may be preserved in perfection a second year.—*Florist and Pomologist.*

First Flour Mill in San Diego.—Mr. I. Lankershim & Co., of this city, have just erected a first-class flour mill at San Diego. The mill has three run of stoues, yet its appointments embody all the latest improvements known. Heretofore, there has not been wheat enough raised in that part of the State to stock a mill; yet the success whicb last year attended Mr. Lankershim's farming was sufficiently encouraging to induce him to erect the mill. He has now 6,000 sacks of wheat in the mill, and will be able to secure sufficieut to supply that entire section with flour, for which article it has heretofore depended on San Francisco. We rejoice at these evidences of prosperity and progress manifested in the numerous distant sections of the State.

Contrivance Better than Hand Work. A regnlar Yank in Lisbon, Connecticut, who wanted to put a water pipe through a drain several feet below the surface without digging up the drain, a few days since, tied a string to a cat's leg, thrust pussy into one end of the drain, and giving one terrific "scat!" the feline quickly appeared at the otber end. Detaching tho string from tbe cat's leg, be made the other end fast to the pipe, and then drew it through.

Grain in San Diego County.—Corn, wheat and barley have done unusually well the past season in San Diego county. The Cajon Company, in Sweetwater Valley, raised 600 acres of wheat, averaging 50 busbels to tbe acre, and 200 acres of barley, averaging 55 bushels. Farmers are making calculations to go into wheat raising on a large scale next year.

Russian Apples.

It may not be generally known that some of our best varieties of apples originated in Russia. The Russiau apples appear to be especially suited to the colder portions of tho Eastern and Western States, where many other varieties prove altogether too tender for successful cultivatiou.

Among the better known apples of Russia now cultivated in America, we may meution the *Alexander*, well known for its size and beauty. The tree is vigorous, spreading in form, and reasonably productive. Tho *Red Astracan* is as well known as any of our native varieties, is cultivated in every Stato in the Union, and thrives everywhere. In extreme southern latitudes it seems to do best on a thorn stock. Has this stock been employed in this State? This apple is unsurpassed for beauty, and though not especially rich in flavor, it is a very desirable apple. It should he found in every gardeu. The *White Astracan* is neither as good nor as generally suited to varying climates. The *Rambour Papeleau* is a vigorous and productive tree, with large, rich, yellow fruit, spotted or splasbed with shades of red. It is comparatively new, but a promising fruit, and a good keeper. The *Borowtsky*, also a Russian apple, is hut little known in this country; so also are the *Charlowoski* and the *Tetofsky*, both very handsome apples, of palo yellow color, striped with red on the sunny side.

Tilton's Journal, from which we condense the above, says that most of tho Russian apples differ from the American in their waxen bloom and largo foliage. Tbey usually ripen early, as tbey must do to come to maturity in the short snmmers of their native region. The *Journal* suggests the policy of producing new varieties from the seeds of the Russian apples, either by natural variation, or by hybridizing among themselves or with othor hardy kinds. It thinks that equally hardy and possibly improved quality and better keeping varieties may he thus produced. No better country than California could be found for such experiments.

Beet Sugar.—A gentleman in Wisconsin writes to a resident here, tbat he was "talked into sugar beets," two years ago, by two Germans. He sends samples of bis sugar made in twenty-four hours from beets. No. 1, very light yellow; No. 2. whitish; No. 3, very white, but not loaf sugar. It is very beautiful. He wants to know about our country (California) for beets. He says: "Beet sugar comes nearor to bullion thau anything I ever touched." He says ho raises ten tons to the acre; each beet weighing from one to five pounds, and yielding eight per ceut. of sugar, or 1,600 pounds of sugar per acre. Refuse pulp sells at five dollars per ton; beets cost four dollars and fifty cents per ton at the mill.

The Sacramento Valley Beet Sugar Company are now testiug beets raised on their farm, located on the east hank of the American river, a few miles from this city. They have already extracted good crystallized sugar, and are now engaged in testing the amount of sugar that can bo taken from a ton of beets.—*Sacramento Bee.*

Steaming Food for Stock.—One who has ample experience in steaming food for stock says that the advantages are: 1. It renders moldy hay, straw, etc., palatahle and satisfactory to the animals. 2. It enables the feeder to mix different qualities of food, hay and straw, good and poor hay, etc., rendering it all palatable, softening the hard, tough fihres, and thus enabling the farmer to save all. 3. It improves the manure, rendering all ready for use. 4. It will cure incipient heaves in horses, and has a remarkable effect upon horses with a sudden cold and in constipation, and keeps all animals more healthy. 5. It improves the appearance of all animals at once, and fattens them in much less time. 6. It saves at least one-third of the food—two bushels of cooked hay will satisfy cows as well as three bushels of uncooked.

In Omaha wheat is selling at 40 cents, corn and oats 35,—a pretty rougb state of affairs for farmers in tbose localites.

Berryessa Valley.—Nearly the whole of the cultivated land in Berryessa valley has already been plowed and sowed this season. Not less than 30,000 acres are already in, which is somewhat in excess of the last sowing.

Sound.—Different sounds travel with different degrees of velocity. A call to dinner will run over a ten-acre lot in a minute and a half; while a summous to work will often take from five to ten minutes.

Frozen Apples.—Michigan lost a million dollars' worth of apples hy the cold snap of the first of November last. Immense quantities were also frozen in Vermout and other Northern States.

Cheap.—Wheat is now selling in Rogue River and Umpqua valleys, Oregon, for 37½ cents, and barley for 25 cents per bushel, and dull sales at that.

An Acid River.—Humboldt found that the waters of the Rio Vinaigre, in South America, which has its source on tho volcano Purace, coutain free sulphuric and muriatic acids. According to Boussingault, this river empties into the Rio Cauca, into which it falls from a height of about 400 feet, discharging daily 34,784 cubic metres of water, containing 37,611 kilogrammes (more than forty tons) of strong sulphuric acid and 31,654 kilogrammes (nearly thirty-five tons) of strong muriatic acid. No fish are found in the Rio Cauca for more than ten miles below the point where it receives these acid waters.

In the island of Java there are several small streams aud lakes which contain free sulphuric and muriatic acids; and ou the island of Sumatra there is a lake which contains free nitric acid. All these phenomena are the resnlt of volcanic action.

The New Gas.—The New York Oxygen Gas Company, incorporated for the manufacture of oxygen, for purposes of illumination, hy the *de*oxidizing and *re*oxidizing of the manganate of soda, bave works which cover eight lots of ground, and consist of extensive buildings of brick and corrugated iron, powerful blowing and compressing engines, an ample gas-holder, and a large French furnace, with twelve retorts, each large enough to contain 800 pounds of the manganate. These retorts are now producing oxygen at the rate of 25,000 cubic feet per day.—*Boston Journal of Chemistry.*

Combs made from Old Shoes.—Old worn leatber, cut up in small pieces, and allowed to remain for two days in chloride of sulphur, becomes very hard and brittle. Being then washed, dried, and ground, and mixed with glue or shellac, it may be shaped in monlds into combs, buttons, knife handles and other articles.

San Francisco:

Saturday Morning, Dec. 25, 1869

Subscription Price Reduced!—This is our last numher of Vol. XIX. Profited by the experience of the past, snd encouraged with liberal patronage, we shall add improvements which will render the next volume of the Press much superior to its former issnes. Its price is reduced to $4 a year. We solicit renewals from old patrons, and would thank them to inform their neighbors of onr change of rates, and solicit a trial of our paper. From manifestations already hefore us, we are confident of nearly doubling onr subscription list during the coming year.

A Bill to Protect Placer Claims has been introduced in Congress by the Hon. A. A. Sargent, of California. It amends the Act granting right of way to ditch and canal owners over puhlic lands, hy adding sections to the effect that placer claims shall he subject to entry and patent under like conditions as are provided for vein or lode claims; that where lands have been previonsly snrveyed hy the United States, no fnrther survey is necessary, and they may be paid for at the rate of $2.50 per acre; that legal suhdivisions of forty acres may be suhdivided into 10-acre tracts; that two or more persons or associations having contignons claims, may make joint entry thereof; that no plaoer claim shall exceed 160 aores for any one person or association; and that where any person has held and worked a claim for a period equal to the time prescribed hy the statute of limitations for mining claims, evidence of such work shall be sufficient to estahlish a right to a patent.

Woman Suffrage.—A call has heen issned hy the officers of several Woman Suffrage Associations for delegates—men and women—to attend a State Convention to he held in Dashaway Hall, San Francisco, on January 26th. The ohject is "to organize a California Woman Suffrage Association, and take such other action as may be deemed wise."

How a Rail is Made.

Rsilrosds sre destined to play such an impor ant part in the development of our Stste, that it may be of interest to our resders to know how an iron rail is msde. Let them go with us to the Potrero and visit the Pacific Rolling Mills—the only works of the kind npon this coast—which were erected in 1868, and have been running steadily since July of thst year. With a capitsl stock of $1,000,000, and an excellent manager, Mr. B. P. Brunner, the compsny hss been ahle to compete with Eastern mills in the manufactnre of railroad and merchant iron. Their enclosure of some 500 feet square contsins a large hnilding, 230 feet hy 130 feet, which is the mill proper, and seversl smaller huildings, used for a holt and nut factory, mschine and repair shops, a pattern shop, and the offices of the Company, besides a lsrge open space for stock and store yards, with a fine wharf npon two sides facing upon the Bay. To this plsce are hrought sll

The Raw Materials.

These are nnloaded from the vessels hy mesns of a donkey engine, and csrs, running upon a narrow tramway, convey them to their varions destinations. Pig-iron being very expensive at present, the chief article used is scrap iron, both cast snd wronght. These two sorts are separated by hand, the csst going to the puddling-furnace to be mixed with pig, while the wrought is made up into bundles ahout two feet long snd six inches square, which are carried to a heating-furnace within the mill. Old horseshoes, heing particularly tough, are reserved for msking an extra quality, called "chsrcoal iron;" they are bought at $34 per ton, common wrought scrap at only $16 to $20 per ton, and cast at ¾c. per ponnd. The coal, which should he free from sulphur, comes mostly from Sydney; the fire-brick and clay come from Liverpool and New York, and the lime and sand from this State. Large scrap iron, hefore heing bundled, has to be cut into small pieces hy means of large shears worked by steam power. These are in sheds adjoining the main huilding. Following the hundles of scrap into the mill, we see them snhjected to

The Heating and Hammering Processes.

The bnndles, weighing 150 pounds each, are "charged" into large reverheratory fnrnaces, hy means of a long-handled iron paddle, and the doors of the furnaces heing closed, the iron is subjected to a slowly increasing heat for several hours, to force the pieces to stiok together and beoome fit to weld. Then the glowing masses are taken ont of the furnace hy mesns of long tongs, then swung upon the anvil of a steam-hammer, and after an iron handle has heen welded to one end of the bundle, the hammer falls upon it. At first there is a great shower of red hot particles of iron and cinder, making the visitor keep at a respectful distsnce; but this soon ceases, and as the man at the hammer has it oompletely under control, the hlows grow stronger or lighter as is desired, until a compact piece of iron is formed called a "bloom." The handle is now cut off hy means of a large knife and one slight hlow of the hammer, and the hloom, still red hot, is put through

The Process oe Rolling.

The rollers (commonly called "rolls") are arranged in pairs, one roll ahove the other, in iron frames, and have grooves of various sizes and shapes turned in them. The "roller" seizes the hloom at one end with his tongs, and shoves the other end hetween the rolls at the largest groove. These catoh and carry the iron through to the other side, making it discharge a shower of impurities in its wake. Soon, however, it reappears over the top of the upper roll, sent hack hy the workman on the opposite side, and it is now mnch longer than at first. Again it is sent throngh, in a smaller groove this time, and comes back as before; this operation heing repested five or six times until the bundle is finally rolled out into a long flat bar. These hars sre cut np and made into piles ahout 2½ feet long and 10 or 11 inches square, which are reheated in furnaces near the rolls, and then passed through a different set of grooves from the former ones, coming out at last a rail in shape, hut with rough and ragged ends.

Sawing and Straightening.

The rail is placed upon an iron bench and moved up sideways against two circular saws with coarse teeth, which make 1200 to 1500 revolutions per minute. It is a heautiful sight, as the rapidly revolving saws throw off a profuse shower of small particles of iron, which burn with grest brilliancy while flying through the sir. To protect the workman, each saw is covered with a sheet iron screen. The rail now passes to a concave floor, or "hench," and is hammered with wooden mallets to fit this. A T or U rail is hroad and thin in its hase, in proportion to its top, and, therefore, if placed npon a flat bench, it will curve up on cooling, bnt the curved hench obviates this difficulty, so that when cold, the rail is nearly straight. After the ends hsve heen filed smooth, and the rail has been inspected, it passes under the straightening-press, where it is made true, and then, after a psir of holes have heen punched into its shank at each end to receive the holts for fastening the connecting bars, the rail is finished.

The calibre of a rail deponds upon its cross-section and its weight per yard. At these mills are made T rails of 50 to 60 pounds, and street rails of 30 to 38 pounds, per yard. A wonderful piece of mechanism which we see here is Gibson's

Spike Machine.

By the old process an iron rod of the proper size had first to be cut into pieces, then each piece heated twice in a forge fire, once for the head and once for the point; hut now the rod is heated in long pieces, and then pushed or "fed" into the machine, which cuts it off, makes a handsome and uniform head, and a point, all at one hlow. The point of each spike has two thin projections called "fins," which guide it when heing driven. Space does not allow us to describe in this connection how the various sizes of bar iron, nuts, bolts, etc., are made, nor to enter into a detailed description of all the varions machines in use at these works; suffice it to say that they can turn out 25 tons of merchant iron, or 35 tons of rails in one day, if necessary, with a force of about 130 men. A piece of economy worthy of notioe is, that there is a boiler huilt into the brickwork over each furnace and heated hy the waste gases, thus supplying all the steam consumed hy the varions engines, though there is a separate boiler and fire, to he used in case of necessity.

An Aerolite.—A meteor recently fell at Krahenhurg, Prussia, which weighed 31½ ponnds, and huried itself two feet deep in the sand-stone rock where it struck. It was dug out while still warm. The rushing sound made by it in its passage throngh the air was heard over a radius of thirteen miles.

Corrections.—In the article, "What are Metals?" on page 402, in the 12th line from the hottom for (Cu O+SO ⁴) read (Cu+SO ⁴); also, in the article last week on the occurrence of Thenardite, *heated* with chloride of harium was inadvertently printed, instead of *treated* with.

Safety Matches.—A London inventor has patented the soaking of matches, before dipping, in a solution of alum. They light easily and hurn well; hut as soon as the flame is hlown out, they hlacken, and may he thrown npon combnstihle matter without danger.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreion Patent Agents, and Publishers of the Mining and Scientifio Press.]

For the Week Ending December 14th.

Scribe Hook.—John Nestor, Portland, Oregon.

Candlestick.—H. Zshn, Ssn Francisco.

Seeding Machine.—James Finlayson, Albany, Oregon.

Construction of Buildings.—Alex. McPherson, Santa Cruz, Cal.

Propeller.—Simon B. Morey, San Francisco.

Latch for Double Doors.—John W. Still, San Francisco.

Recent Patents.

Among the interesting and important patents recently issued to Pacific Coast inventors, the following sre worthy of mention:

Improved Anchor.—Elisha T. Barlow, San Francisco, Cal.—This invention relates to that class of anchors in which the flukes move from side to side of the shank, so as to get the proper position for taking hold of the ground. The flukes are made in two separato parts and attached to separste crown pieces. The anchor has two shanks moving parallel to each other, to one end of which the crown pieces with their respective flukes are attached, being holted to each shank so that the opposite longitudinal movement of the shanks will cause the flukes to move from side to side to the position for catching in the ground. To the opposite end of the shank, metal plates are so attached and fastened to the ship's chain or cable, that on drawing upon the cable, whichever shank is uppermost will be drawn forward, thus turning the fluke downward to the holding position.

Latch for Doors.—John W. Still, San Francisco, Cal.—The object of this invention is to provide a latch, which will operate equally well for a single door, or for either half of a double-door. It consists of an elastic strip of metal, extending ont hetween the doors, or the door and the casing. At the end of this spring is a wedge-shaped head, having its base inwards. The doors are slightly cut away, so that, in closing, they will press on the inclined side of the head, and bend the spring to one side until the doors has passed the head, when the spring returns to its original position and holds the door.

Pitch Board.—John R. Drew, San Francisco, Cal.—This is a board for measuring the height and width of steps. It is of triangular shape, one side being of suitable length for measuring the rise, another for measuring the tread; as in different stories of a house the stairs are built of different size, a different pitch board is necessary for eaoh flight. To avoid the loss of time and also of lumber in making these diffcrent boards, which may never be of use a second time, this board was constructed so that it can be extended at the sides, enabling the builder to set it to any desired size.

Construction of Buildings.—A. McPherson, Santa Cruz, Cal.—This improvement consists in laying between the conrses of brick, stone or other material, layers of lath, strips of wood for thin metal in such a way as to bind the wall in every conceivable direction. As these are also placed vertically, the walls are solidly bound together, and rendered exceedingly strong, and proof against the shocks of earthquakes, etc.

Propeller.—Simon B. Morey, San Francisco, Cal.—In order to obviate the loss of power caused by the buckets of the ordinary paddle wheel as they pound on and lift up the water on entering or emerging therefrom, this wheel contemplates a continuous and regular sculling, or to and fro side motion.

The Preservation of Wood by Hydro-Carbons.

ADDRESS BY CAPT. JAMES H. WHITE,

Before the Institute of Architects and Invited Guests, at the Mechanics' Institute, December 15, 1869.

Gentlemen, in compliance with your invitation of December 10th, I appear before you, and will endeavor to explain the process of preserving wood with hydro-carbons, as secured by Letters Patent to John Bethell, of England, in the year 1838, and to Luis S. Robins of the United States, in the year 1865, and express my opinion as to the benefits resulting therefrom.

EXPERIMENTS.

A series of experiments had been carried on for seventy years in the various naval departments of Europe and America, tending to the preservation of wood against the ravages of time and the destructive *Teredo Navalis*, or ship worm; but not till the year 1838 was any one of the various efforts successful.

Kyan, in 1832, patented a process for preserving wood with chloride of mercury.

Margary, in 1837, for preserving with sulphate of copper.

Bethell, in 1838 and 1848, with creosote or pitch oil.

Burnett, in 1838 and 1840, employed chloride of iron and sulphate of copper.

Boucherie, in 1839 and 1846, using pyrolignites of iron.

Payne, in 1841 and 1846, used sulphate of iron and carbonate of soda.

BETHELL'S PROCESS.

All of these processes for preserving wood have been cast aside as worthless, except Bethell's. His process differs from all the others in so far that the oil used—creosote, carbolic acid, or the phenol of Professor Faraday—is not only a most powerful coagulator of albumen, but it likewise preserves the fibre of timber. This process has been in use in England, Ireland, North and South America, in India, and all continental countries of Europe, wherever railways have been constructed; also, in harbor works, for which it is especially applicable by reason of its resisting the attacks of marine worms and insects. Doctor Ure asserts that the Bethell process produces perfect coagulation of albumen or sap, thus preventing putrefaction. Doctor Letheby states in the *Journal of the Society of Arts* that the preservative properties of creosote are of four kinds:

1st. That it coagulates albuminous substances, and gives stability to the constituents of the cambium and celluloso of the young wood.

2d. It absorbs and appropriates the oxygen which is within the pores of the wood.

3d. It resinifies within the pores of the wood, and in this way shuts out both air and moisture.

4th. It acts as a positive poison to the lower forms of animal and vegetable life, and so protects the wood from the attacks of fungi, acari, and other parasites. The above facts are from the *Chemical News* of May, 1869, as read before the Glasgow Philosophical Society, by P. M. Moir, February, 1, 1869.

In a report presented by the Minister of Public Works in Belgium, in May, 1863, to the Legislative Assembly, in respect to railroad timbers, he states that after a careful examination by the authorities, all creosoted sleepers (although some of them had been in use nineteen years) were found to be perfectly sound and fresh, which established the fact that the Bethell process was superior to all others, and that the Government had determined to have all their railroad timber creosoted in the future.

I could give you the testimonials of very many of the ablest scientists of the land to sustain the facts I have quoted, but think it unnecessary. The Bethell process, although an undisputed success, is nevertheless very expensive in the cost of machinery and manipulation, and can be used only upon seasoned and unmanufactured timber. Bethell's process is to saturate timber with liquid hydro-carbon under a pressure of 150 pounds to the square inch. He uses the raw coal tar, and by mechanical pressure forces the liquid into the wood. Expensive as this process is, it can only be used upon coarse work, such as bridge timbers, piers, railroad ties, etc. The machinery required to force the liquid into the wood is complicated, and demands skillful and scientific manipulation.

ROBINS' PROCESS.

Mr. Robins, the American inventor, profiting by the experience of Bethell, and accepting the testimony of scientific and practical men to the efficacy of coal tar and its products for preserving wood, invented his process, upon the basis of adaptability and economy, to meet the wants of the American people and the exigency of the times; and his efforts have been crowned with success, as is proven by the many testimonials of the ablest architects, engineers and chemists of our country, whose certificates are attached to his circular.

Robins' process is to place the wood in air-tight chambers, connected by a goose-neck with a large still containing the oil of coal tar, or crude petroleum, as may be desired. By heat the oil is converted into vapor, and passes into the chamber containing the wood. These vapors, he claims, drive the air out of the chamber, out of the pores of the wood, coagulate the albumen of the sap completely, and fill the pores of the wood with creosote or carbolic acid. The fibrous portions of the wood are saturated with the vapors of the oil, which condense in the wood, and thus prime it, and furnish a coating, which protects the fibre against moisture.

It is noteworthy that Bethell's is the forerunner of Robins' process; Bethell uses coal tar oils, Robins also uses coal tar oils. Bethell required the filling the pores of the wood with carbolic acid, or creosote oils; Robins demands the same conditions, and achieves the thorough saturation of all lumber with the preservative elements, which were only partially introduced by Bethell. Bethell availed himself of the liquid oil only, Robins uses the refined vapors of those oils; Bethell could make use of seasoned timber only. Robins' process is applied to seasoned or unseasoned wood, whether manufactured or unmanufactured.

The treatment of wood by the Robins process adds to its strength. This has been reduced to a certainty. Colonel M. O. Davidson, Chief Engineer of the New Haven and Derby Railroad, obtained certain pieces of wood, which he sawed, and caused one-half of each to be treated by the Robins process; he then sent the pieces treated and those untreated, of each kind, to Alban C. Stimers, Naval Engineer, New York, and requested him to make a thorough test of the relative strength of each. The following is Mr. Stimers' report, or an extract therefrom. He says the Robinizing adds to the strength of white pine, 37 per cent.; and white ash, 50 per cent. In conclusion, he says: "If we take a case of practical dimensions, such as a beam 20 feet long, between supports, 6 inches wide and 16 inches deep, we find that the ultimate strain required to be applied to the middle to break the beam will be in each case, as follows: White pine in its natural state, 20,966 lbs.; Robinized, 28,877 lbs.: white ash natural state, 51,272 lbs.; Robinized, 76,723 lbs.

The Robins process claims to treat all kinds of wood, and for all purposes, from the finest finish of buildings to the coarsest railroad ties and sleepers; also, all kinds of timber for houses, street blocks, and piles for wharves.

Such authority as Charles T. Jackson, M. D., State Assayer of Massachusetts; L. B. Hall, Professor of Chemistry, Dartmouth College; E. T. Quimby, Civil Engineer, Dartmouth College; J. S. Schanck, Professor of Chemistry of Princeton College, New Jersey; A. Guyot, also of Princeton College, Professor of Geology; George H. Cook, Professor of Chemistry and State Geologist of New Jersey, are a few among the many names of scientists who endorse the Robins mode of preserving wood. His circular also contains the names of many eminent architects and practical engineers, endorsing his process.

After nineteen years of trial and success with creosote, or carbolic acid oil, as a preserver of wood, it will not be saying too much to say it is no longer an experiment, but a demonstrated fact that wood can be preserved from decay by the use of hydro-carbonates properly applied.

STREET PAVING.

I hope it will not be out of place at this time to say a few words upon the subject of street paving. For the most important consideration to every commercial and growing city is her streets, pavements and roads, and their construction with proper materials. The subject of street pavements has long occupied the minds of many of our ablest inventors. Among the first devices to supply this want was the round cobble stone; next, the McAdamizing with small, hard stone, of about six ounces weight; next, the Russ blocks of trap rock, ten by fourteen inches, and eight inches deep; next, the Belgian, also of trap rock in six-inch cubes, laid like the Russ; next, the Guidet plan, lately introduced in New York, and as yet only an experiment. In this plan blocks of granite are employed, standing on edge; Size, twelve, eight and four inches, laid in sand. But the same objections will ever be made to all stone pavements by those living near—the noise of traveling vehicles—which, to many, is very annoying, besides the destruction to vehicles and the feet and limbs of horses.

Next is the concrete or asphalt paving, which is a combination of gravel, cinders, broken stone, sand, coal ashes and pine tar, laid upon a sand or rock bottom, from four to six inches deep. This is the well-known pavement used at Paris, and is highly spoken of. It is very doubtful whether this composition would stand the heavy usage permitted by our municipal authorities, and its first cost would be heavy. I would say just here that, about twenty-five years ago, the municipal authorities of the city of Saint Louis were compelled to pass an ordinance prohibiting wagons or trucks from passing over or upon her streets, carrying over a certain weight, and also prescribing the width of the tire upon the wheels, at 4 inches and nothing less, for all wagons carrying 80 bushels of bituminous coal, for at that day the city was supplied with wood and coal from the surrounding country. No wagon was permitted to carry upon the streets of the city, at any one time, over 80 bushels of coal, and all coal was to be weighed, and the owner to receive a certificate of weight from the officer appointed for that purpose. For offering or selling without a certificate, or with the tire less than 4 inches in width, the owner was subjected to a heavy fine. In the sale of wood, a cord in that city was made to contain 128 cubic feet, and when a citizen purchased a cord of wood he was sure to get it, whether the sticks were 3 or 4 feet long. If there should be some ordinance here regulating loads and width of tires, the city might receive a revenue from the same, and would protect her pavements. Allowing heavy trucks to haul what weights may please their owners, will soon cut any pavement to pieces.

WOODEN PAVEMENTS.

It is now conceded that wooden pavements, laid according to recent improved modes of construction, are in every respect superior to those laid with stone, cost what they may. Wood pavements are all paid for every two years in the saving of horse flesh and vehicles. We have several devices for wood pavements. The Nicholson, McGonagel Stafford, Stowe, De Golyer, Brockelbank and Trainer—all valuable devices. In this city we have tried the Nicholson and Stow pavements only, and acknowledging them to be the handsomest pavement and easiest of travel of any we have tried, they are a failure as to material and construction. The mere fact of dipping the blocks in hot coal tar or asphaltum, is no preservative against decomposition or expansion and contraction; and in a climate like this, such treatment is more injurious than beneficial. No wood pavement will or can be permanent and lasting without thoroughly carbonating all the wood with hydro carbons—first removing or destroying all the albumen or fermenting substance in the wood. This albumen is the cause of decomposition in all wood, and in a sanitary point of view is a fruitful source of disease from the unwholesome emanations emitted in the course of its decay.

THE CAUSE OF THE DECAY.

The Health Officer of Cincinnati, Doctor Clendenin, made three analyses and microscopical examinations of the dirt scraped from each of the different kinds of pavement in the streets of that city. He found the scrapings from the Nicholson wood pavement contained a much greater proportion of organic matter than either of the others, and that they are filled with vegetable fungeids, of a kind to seriously affect the public health. The Doctor has also investigated the subject of treating the blocks for the streets by the Robin's process, and compared notes with the Boards of Health of New York and Boston, and is convinced that wood treated in this way is not liable to decay; that the carbolic acid with which it becomes impregnated will exercise a disinfectant influence on the organic matters which come in contact with it in any shape, and that this treatment disposes of the objections to wooden pavements which have been heretofore urged by Boards of Health, on the score of their influence on the public health. These conclusions on the part of so able a scientist, as the Health Officer of Cincinnati, will have great weight with scientific men throughout the country. The force acting upon street paving is a crushing force. To show the resistance of such a force by wood treated in the manner proposed, experiments have been made with two equal sized cubes of the same kind of wood, one of which had been thoroughly treated with carbolic acid, or creosoted as it is termed, and the other not treated at all. A weight of fifteen tons was placed on each—the untreated cube was wholly crushed, its fibers being altogether broken; while the cube which had been subjected to the Robins treatment, retained the integrity of its fibers, and the wood was found to be compressed only one sixty-fourth of an inch.

The wood used in San Francisco for street pavements is the Oregon fir in its natural condition—simply sawed into blocks. It has a short life. We also have the redwood in abundance, which is a durable wood, when only exposed to the elements, but a very soft wood, too soft, in its natural state, for street paving. Redwood would be improved by treatment with hydro-carbons; as it has been fully proven by the French Government in experiments made from 1863 to 1868, that creosoting all woods makes them stronger and harder. The difference in the crushing weight to the inch cube between wood treated by the Bethell process and untreated wood, is as follows: Oak, 70 pounds; ash, 100 pounds; elm, 10 pounds; red spruce, 27 pounds; sycamore, 10 pounds; white spruce, 20 pounds. It must be understood, when we speak of treating woods with hydro-carbons, or carbolizing, or carbonating, that they are to be perfectly done, perfectly saturated in every pore, and perfectly seasoned. The Robins process will do this in my opinion. The main object kept in view, in this wood preserving process, is to make the wood, as near as practicable, as durable and as free from decomposition as charcoal, while uniting the fiber by the coagulating oils and crystals of carbolic acid, and thus increasing the strength of the wood.

This whole system of preserving wood can be summed up in a few words that all can understand: In the first place you must remove the albumen from the wood, or destroy its fermenting qualities; you must then occupy its place in the pores of the wood with carbolic acid and its associate disinfectant oils, introduced in the finest condition; you can have it in such a condition in a state of vapor, and when thus properly applied your work is accomplished.

The Pacific Wood Preserving Co., whose works are situated on Berry street, in this city, are the owners of the Robins patent.

COST OF MAKING IRON IN RHODE ISLAND. Rhode Island declares that it can make iron at a cost not exceeding $22 a ton. They have the mines of iron and coal, and are tired of paying Pennsylvania prices.

POLYTECHNIC LECTURE.—Mr. Hubert Burgess will deliver the next lecture at the Mechanics' Institute, on Thursday evening, January 6th, 1870,—continuing the subject of perspective drawing.

New Books.

THE POLAR WORLD: A Popular Description of Man and Nature in the Arctic and Antarctic Regions of the Globe. By Dr. G Hartwig. With additional chapters and 163 illustrations. New York: Harper & Brothers, 1869. 8vo. pp. 467. Received from and for sale by A. Roman & Co., S. F.

The narratives of expeditions to the polar regions have always had a powerful fascination for the general reader. And ever since Dr. Kane published his interesting accounts of, first, the Grinnel, and then his own, expeditions, books of the kind have been eagerly sought for, especially in the United States. Of late years, a large number of volumes have been written on the subject, but, as far as we know, there was no single work which covered the whole ground. The present volume, however, supplies this deficiency for the popular reader, treating as it does of all the polar regions, north and south. Condensing into a small space the valuable facts ascertained by numerous explorations, and at the same time being written in a very pleasant and readable manner, it makes a valuable addition to any library. We see but one thing to complain of, and that is the absence of any map.

We naturally turned to the chapter on Alaska, to see what were the conclusions about this late acquisition of ours. We find the following conclusion:

"Quite nine-tenths of the whole territory of Alaska is purely Arctic, and is not only uninhabited but uninhabitable. The other tenth is now sparsely inhabited, and there is little reason to suppose that the population will ever be greatly beyond its present number. Except in special cases, the possible population of a country is measured by its agricultural capacity. Leaving out of view the extreme northern parts of Alaska, the best accounts as yet accessible show that at St. Michael's, lettuce, parsnips and turnips can be raised by sowing them in beds. At Fort Yukon, potatoes not much larger than cherries can be raised. At Sitka, potatoes will grow a little larger. On some of the islands the inhabitants can even venture upon barley. The forest trees, which flourish in isolated parts, will soon be exhausted, as far as any profitable use of them is concerned. Fish and furs constitute almost the sole value of Alaska. The fisheries are among the most valuable in the world. The furs will soon be exhausted, unless prompt measures are taken to prevent the capture of fur-bearing animals in the breeding season."

On the subject of trees, we find, by the way, the following opposite opinion in the San Francisco *Bulletin:*

"We have before us some data furnished by a resident of Sitka, which shows that there is an extent of country bordering on the coast of Alaska, equal to twenty miles in width and 700 miles in length, in which the white and yellow cedar predominates. How much more extensive the "Cedar Country" may be, our informant did not know. The cedar timber is then inexhaustible. Our redwood timber covers a limited area, and at the present rate of destruction will not last fifty years. Probably no tree is now growing upon the Pacific coast of so much real value as the red cedar of Alaska."

USEFUL INFORMATION FOR RAILWAY MEN. Compiled for the Ramapo Wheel and Foundry Co. By W. G. Hamilton, Engineer. New York: D. Van Nostrand, 1869. Received from and for sale by A. Roman & Co., S. F. Price $2.

In this very compact and convenient pocket book is contained an immense amount of information on very varied topics. As its title indicates, railways take up the principal part of the work. It contains rates of postage; a very neat little railway map of the United States; notable events; lengths of different railroads; tables of weights and measures and time; all sorts of tables with regard to iron, steel, rails, car wheels, cars, bridges, locomotives, fuel, costs, etc., etc.; various statistics of interest; and even recipes for various common cases of sickness. Just now we have many railroad men who will profit by the perusal of such a hand book.

PHEBE TRAVERS, or One Year at a French Boarding School. By Aunt Florida. Illustrated. 12mo, pp. 192. San Francisco: A. Roman & Co. Price 75 cts.

This is another of the pretty stories for children, which are getting so numerous. This little history is very nicely and attractively written, and is highly to be recommended to child-readers.

Mining in Australia.

The *Mining Record*, of June 19th, published at Melbourne, contains a review of "The gold fields and mineral districts of Victoria," by R. Brough Smyth, Secretary for Mines, for the colony, from which we quote the following statistics in reference to quartz mining in Australia, which may be read with interest, if not with profit, by those who have, as well as those who have not, faith in that business:

The existence of gold in Australia was first made public in 1852, three years subsequent to its discovery in California. Up to December 31st, 1868, there were 5,811,-669 tons (2,240 lbs per ton) of quartz, mined and milled, which averaged 11 dwts. 12.37 grs. of refined gold per ton—$11.50. The Port Philip Company commenced operations in March, 1857. From that date to March, 1869, twelve years, they mined and worked 470,839 tons of ore, which produced an average yield of 10 dwts. 18 grs. —$10.75 per ton.

For some time past, the yield from the company's mines (5) has averaged little, if any, over $7 a ton; yet the shares are fifty per cent. above par. The company have recently built another mill, with 24 stamps, which make in all 104 stamps, with a capacity to work about 6,000 tons a month. They employ Chambers' stone breakers, similar to Blake's, and use self-feeders for their batteries. Their appliances for saving gold are similar to those in general use in California. The capital of the company—£100,-000—is divided into 100,000 shares, of £1 each, which, notwithstanding the reduced yield of the ore, are now about fifty per cent. above par.

In the colony, there are sixty-nine quartz companies paying dividends; the shares of one, the "Clunes, Clunes," are quoted at £475—for £1 paid! There are also sixty-nine companies which are not paying dividends, yet the shares of many of them command a high premium on the amount *paid in*.

There are twenty-seven alluvial companies paying dividends, against thirty not paying dividends. These statistics refer to those companies only whose shares are on the market.

The number of gold mining companies registered in the several Courts of Mines up to the 31st of December, 1868, is 2,471; the number of shares, 7,421,492; and the *nominal* capital £24,431,205. It is estimated that not more than ten per cent. of this capital has been paid up.

The length of water races constructed by miners is 2,434 miles, at a cost of £310,270, equal to £127 9s. 5d., or $637 a mile.

In 1867, the population of the colony was 659,887. The imports, £11,674,080. The exports, £12,724,427. Gross revenue, £3,-210,504. Expenditure, £3,368,536. Acres under cultivation, 631,207."

As a knowledge of what has been, and is being done, in a distant country, occupied by people similar to our own, may lead to a better knowledge and a better appreciation of the resources of our own State, we propose to make further quotations, not only from the valuable and important work of Mr. Smyth, but from the *Mining Record*.

An English paper says that photographic portraits can be printed with printer's ink. They are as permanent as a printed text, and so easy of production that 12,000 may be made from a single plate in one day.

GEO. E. ROGERS,
(Successor to G. W. Bell.)
ASSAYER,
512 California st., San Francisco.

I. O. O. F.
THE NEW AGE,
A WEEKLY JOURNAL OF SIXTEEN PAGES.
The "Official Organ" of the I. O. O. F. on the Pacific Coast.
Is devoted to Odd Fellowship, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco. 19v19

Metallurgy.

MOSHEIMER'S
Pioneer Mining School
—AND—
METALLURGIC WORKS.
ESTABLISHED.....1858.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to work any kind of ore, or mineral substances.
Special attention I would call to all parties who have the so called rebellious ores, that I undertake the construction of any kind of Smelting, Chlorination, Amalgamating, Refining, or Manufacturing Works.
I refer not to single persons, but to all the works which I build in the States of Nevada and California, all of which are in successful operation.
For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2065 Powell street, San Francisco. 16v19-3m.

Metallurgical.
The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at
No. 36 FREMONT STREET,
And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.
Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.
By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public.
☞ Mines Examined and Reports made.

Oil Cake Meal.

THE BEST FEED KNOWN
For Live Stock.

We desire to call attention to OIL CAKE MEAL, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal; and in the U. S. Government Report of the Department of Agriculture for 1865 it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz.: Indian Corn Meal, 14 pr. ct.; Barley Meal, 13 pr. ct.; Oat Meal, 18 pr. ct.; Oil Cake Meal, 22 2-100 pr. ct. For life-sustaining properties for all stock exposed to sudden changes of weather or overdriving it has no equal.

FOR MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any other feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other food; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It will improve it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy and of much finer quality than when fattened on any other feed; and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness, evenness and glossiness of the hair.

FOR SHEEP there is no article of feed known that produces such fine mutton or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price ($28 per ton) it is the cheapest feed in market. It is now selling in New York at $42 per ton, gold; at $50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this meal from those on this coast by whom it has been thoroughly tested has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed dealers, and at the manufactory, King street, near Third All orders will receive prompt attention. Address—

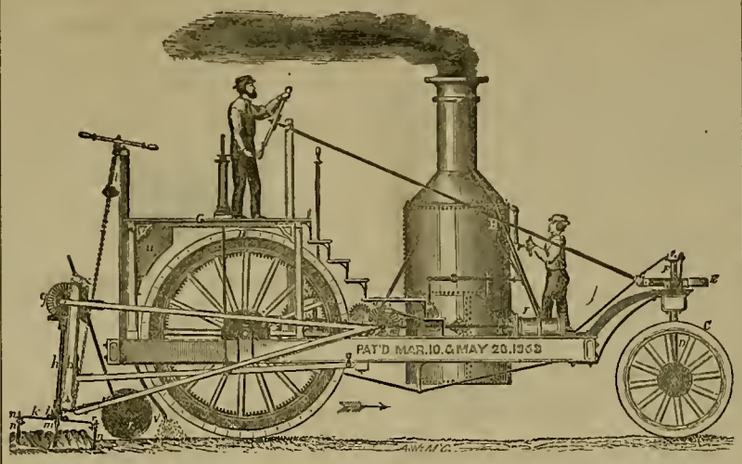
The Standish Patent California Steam Plow.



Capacity, from FIFTEEN to THIRTY Acres per day. The success of this invention for plowing large fields, is established beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of cultivating their farms, are invited to call upon the inventor, PHILANDER H. STANDISH, or address him by mail, Box 17, San Francisco. Single Machines for sale. Also, State rights, and patents for England, France, and Russia.

$10. $15. $20. $25.

THE CELEBRATED IMITATION GOLD HUNTING WATCHES,

"Collins' Metal" (Improved Oroide).

These justly celebrated Watches have been so thoroughly tested during the last four years, and their reputation for time and as imitations of Gold Watches is so well established as to require no recommendations. Prices—Horizontal Watches, $10, equal in appearance and for time to Gold Watches worth $100; Full-Jeweled Levers, $15, equal to $150 Gold ones; Full-Jeweled Levers, extra fine and superior finish, $20, equal to $200 Gold ones.

We have just commenced making a very fine American Watch, full-jeweled, patent lever, chronometer balance, adjusted to heat, cold and position, 4½ ounces down weight, equal in appearance and for time to a Gold Watch costing $250. We charge only $25 for these magnificent Watches. All our watches in hunting cases, gents' and ladies' sizes, chains, Collins Metal, $2 to $8. Also, all kinds of jewelry, equal to gold, at one-tenth the price.

CALIFORNIA DIAMONDS SET IN GOLD.

We are now making jewelry of the California Diamonds. These are real stones of great brilliancy and hardness, and cannot be distinguished from the genuine stones, even by good judges. They are particularly brilliant at night by artificial light, do not scratch or become dull by use, and retain their brilliancy for an indefinite time. The following are the prices:

Ladies' and Gents' Finger Rings, single stones, one carat weight.....$5 each.
Gents' Pins, single stone, according to the size of the stone.....$4 to $6.
Ladies' Cluster Pins.....$7 50.
Ladies' Cluster Earrings.....$7 00.

TO CLUBS.—Where six Watches are ordered at one time, we will send a seventh Watch free. Goods sent by express to be paid for on delivery.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.

F. L. A. PIOCHE.....Proprietor
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the vicious circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness with the advice of a PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the physician only can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*; Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 26v18tf

[SPECIAL NOTICE.]

Winn's Patent Shampooing Apparatus

By the use of the apparatus here shown, the unpleasant mode in which the operation of shampooing is usually performed, is converted into a neat and tidy process, very effective and decidedly agreeable. By the aid of this apparatus, the head is washed and scrubbed in a bath of water, of any desirable quantity or temperatnre, and the employment of which, upon the top of the head, is productive of the most delightfully agreeable sensations, such as impart an entirely new feature to the process of shampooing. The apparatus is tasteful as well as substantial in its construction; and its use is equally as effective when applied to the long, flowing hair, as worn by the ladies, as to the shorter hair of gentlemen's wear.

To form this apparatus, a rim or bottomless pan is first constructed, with a gutta percha lining so devised and provided with an elastic strap, as to fit tightly around the head, below the principal part of the hair. The drapery or curtain, which is seen to fall below the rim, is both for ornament and use; it serves to conceal from view the somewhat unsightly straps, lining, etc., which form the water-tight joint between

the head and apparatus thereto applied, and a subsequont elastic gutter, which is strapped tightly about the head, at the extreme lower part of the hair, to catch any water which may possibly escape from the main apparatus. As seen in the engraving, each has a flexible tube appended, by which the water may be carried off to a sink or other suitable receiving vessel, so that the person will have no occasion to leave his seat during the entire operation, or even to remove his neck-tie.

The soap-suds or any other shampooing fluid which may be employed, is poured upon the top of the head, within the rim, after it has been properly adjusted, and a brush or mop, or sponge, or any other suitable instrument, is then employed within the body of the liquid to clean the head and hair. The liquid is readily discharged through a stop-cock and the tube shown in the rear, and fresh water for rinsing applied, as often as may be desirable. Standards, with curved rests or supports, placed upon the shoulders, and adjusted by screws upon the top, all shown in the engraving, are affixed for the purpose of taking the weight of the apparatus and a portion of the weight of the water from the head. The flexible rim which adjusts the apparatus to the head makes this device practicable.

Previous to putting on the rim an elastic strap is placed around the head to hold up the hair intended to be included within the rim, when it may be properly washed and cleansed. This arrangement is particularly useful and indispensable in fact, in shampooing the head of a lady with flowing hair. This combined apparatus renders the process of shampooing as easily and as readily performed for a lady as for a gentleman. Mr. M. L. Winn, of this city, the inventor and patentee, exhibited his apparatus and the practical employment of the process, in the Mechanics' Fair, and will soon open a saloon in this city. The patent was obtained by the M. & S. PRESS PATENT AGENCY.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEEN & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

18v18-9p 519 Front street, San Francisco

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

A Word for Home Inventors.

OAKLAND, CAL., December 1, 1869.

MESSRS. DEWEY & Co.—Gentlemen: Permit us through your paper to return our earnest thanks for the prompt and successful manner in which you have conducted the various matters of business with the Patent Office committed to your care, more especially in securing for us our last valuable patent in the face of so many difficulties. Were it an ordinary case, in which you had simply secured us a patent, and for which services you had received a suitable equivalent, we should hardly consider you entitled to our thanks, however much we might feel gratified with your professional ability, uniform courtesy, or success. But this seems to be an exceptional case, and entitled to peculiar consideration. Without entering here into a detailed account of the legal complications and various discouraging circumstances you were obliged to contend with, suffice it to say, that your almost unhoped for success, securing, as you did, a full patent, despite all these obstacles, in so short a time, was scarcely less surprising than gratifying to us; and we feel it a pleasant duty to offer you this merited testimonial of our appreciation for the valuable services rendered, and to return you our sincere thanks for the same.

In closing, we would say to the public that this is entirely voluntary on our part, as Messrs. Dewey & Co. neither asked it at our hands, nor knew that we intended giving it. It is simply a free-will offering to professional skill and reliability, and a word of friendly counsel to others on this coast who may be possessed of valuable inventions on which they wish to secure patents. To all such our earnest advice is to place them at once in the hands of Dewey & Co., instead of being driven to it by a sad experience like our own.

Yours truly, HUBERT BURGESS,
JAMES STRATTON.

FOR AN IRRITATED THROAT, Cough or Cold, "Brown's Bronchial Troches" are offered with the fullest confidence in their efficacy. They have been thoroughly tested, and maintain the good reputation they have justly acquired. As there are imitations, be sure to obtain the genuine.

To a lady friend, no present would be more acceptable than a pair of opera glasses. C. Muller, 205 Montgomery, has a fine assortment. ***

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

PAIN KILLER, after a thorough trial by innumerable living witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is, that its sales have constantly increased, and wholly upon its own merits. The effect of the Pain Killer upon the patient when taken internally, in case of Cold, Cough, Bowel Complaints, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony as an almost infallible remedy that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

REDINGTON & CO. and HOSTETTER & SMITH, San Francisco, General Wholesale Agents. de4

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

☞ A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, have just issued a neat little volume of over five hundred well executed wood cuts of the principal Mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the M. & S. PRESS office, postpaid, for $1.—*New Age.*

Steam Engines and Boilers constantly on hand and for sale.

We would call particular attention to our

SCOTT & ECKART CUT-OFF ENGINE.

As a simple, effective, fuel-saving, first-class Engine, it has no equal. We have twenty-five of our Cut-Offs at works on this coast, every one of which gives entire satisfaction. We refer with pleasure to the report of the Committee on Engines at the Sixth Industrial Fair, which we annex. They say:

"*Horizontal Steam Engine of the Union Iron Works.*—This Engine is 16 inches diameter of cylinder, 3-foot stroke of piston, and is provided with Scott & Eckart's Patent Variable Expansion Valve. It is very substantially built, well proportioned, and capable of doing severe duty. This Engine was used every third day to drive the machinery of the Exhibition, *working very smoothly and steadily under all circumstances, and with great economy.* The friction brake was applied to this engine; but owing to the fact that the belt which had been provided for merely driving the machinery of the Exhibition was not of a suitable size to transmit the full power of the engine, the test was not applied above 20-horse power; *and up to this point the power was developed with the greatest possible economy in the expenditure of steam.* In speaking of the performance of this engine, the variable expansion valves of Messrs. Scott & Eckart deserve special mention of the ingenuity displayed in the arrangement of the valves and in the attachment of the same to the governor, whereby the position of the slides is changed so quickly to accommodate any change of load upon the engine *that the correct speed of the engine is maintained with* WONDERFUL UNIFORMITY *under all circumstances.* This engine will work 50 or 60 horse power with ease and economy. Awarded silver medal. Wm. Burnett, Mont'y Fletcher, John Myers."

Pickering Governors, Machinists' Lathes,

Planers, Shapers, Drills, Etc.,

On hand and for sale, Drawings furnished free of cost. Orders promptly attended to. A complete stock of fittings on hand.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon. etc.

"A SUCCESS UNPRECEDENTED."

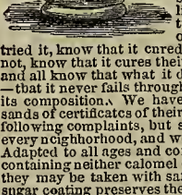
[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.
8v19-6m

Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.



Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite,** they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers,** they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa,** but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins,** they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill,* take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

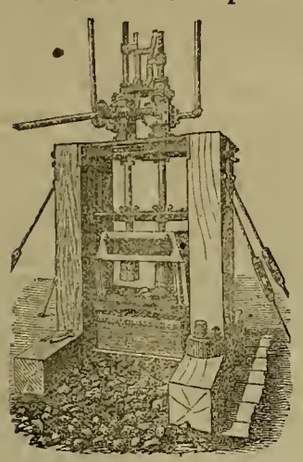
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast, Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

☞ The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars luquire of

A. BICKNELL, Agent,
Nevada City, California,

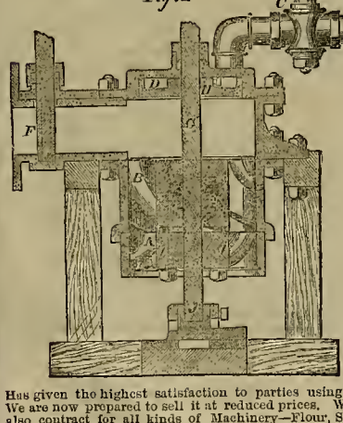
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Lind's Improved Water Wheel

Fig. 1



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

A. LIND, Millwright,
Pacific Iron Works, San Francisco.

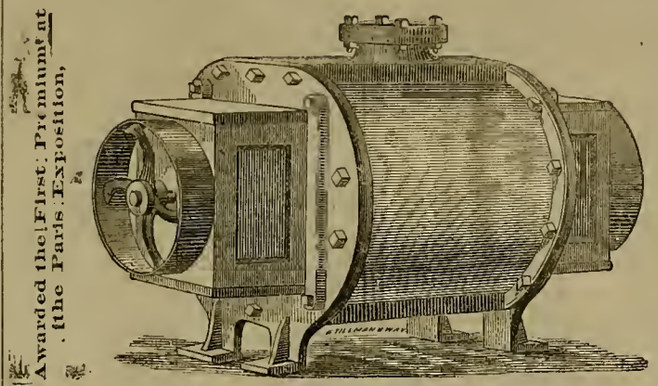
Refer to John Sime and J. Haley. 19v19-3

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

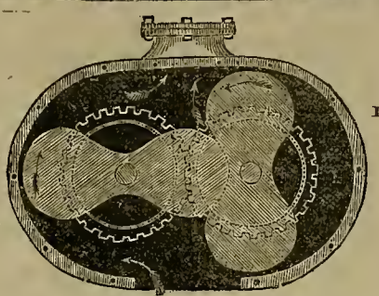
Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR

Smelting, Foundry, Mining and Steamships.



REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may he seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

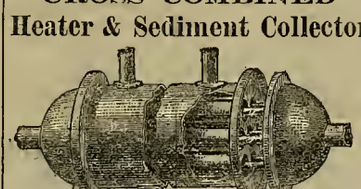
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16-3m **Globe Iron Works, Stockton, Cal.**

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ores is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the office, **229** Fremont street,

1v1 San Francisco.

International Hotel,
JACKSON STREET,

BETWEEN MONTGOMERY AND KEARNY STS.,

SAN FRANCISCO, CAL.

Y

Yosemite Valley Mineral.. 296
Yuba County Mining Summary..6, 182, 198, 230, 246 262 342, 374, 388, 404

Z

Zinc, Silver Extraction.. 217
Zinc melted in Iron Ves'ls 99
Zinconia Light..... 19
Zoic Theory of Chemical Geogony..... 356

List of Patents

Issued to Inventors in the Pacific States and Territories.

Erial Steam Carriage, F. Marriott..... 368
Amalgamating Process, Paul & Wood..... 277
Amalgamator, G. Stevens 28
Anchor, E. T. Barlow.... 377
Anchor, G. A. Lloyd & C. A. Stewart..... 265
Assaying Apparatus, J. S. Phillips..... 185
Bale Ties Lock, J. Wheelock..... 349
Bellows, Reforcating Force, Butler & Stucker. 60
Belly Band Fastener, C. H. Horne..... 377
Beverage, C. Ness..... 346
Blacksmiths' Cushion, M. Delaney..... 363
Blind Wirling Machine, J. Kindleberger & W. A. Arnold..... 265
Boat-Detaching Apparatus, D. Brown..... 210
Brake, Self-Acting, J. W. Swales..... 185
Brake, Car, Yoorm and Cowan..... 309
Bucket, Chain Elevator and, J. A. Ball..... 345
Cabinet for Ladies, J. Forbes..... 345
Candlestick, H. Zahn..... 408
Can Opener, E. F. Dewey 24
Can Opener, M. L. Lewis 60
Carpet Beating Machine, L. Miner..... 309
Carriage Pole and Shafts, A. Moore & J. Aylward. 116
Carriage Spring, J. W. Gilmer & W. H. DeValin... 140
Chair Spring, T. C. Purington..... 377
Chimney, P. Portois..... 277
Chimney, Earthq'e Proof, B. F. Mann..... 265
Chisel for Mortising, C. Hinz..... 116
Circular Sawmill, David Evans..... 185
Concentrator, W. G. Heslep & F. A. Cochrane.. 28
Concentrator, A. D. Smith 76
Concentrator, E. Coleman 92
Construction of Buildings, A. McPherson.... 408
Copy-Holder for Printers, J. S. Butler..... 309
Coupling, Flexible Pipe, Q. Rico..... 393
Cultivator, Steam, A. J. Sievers..... 116
Curtain Fixture, J. W. Foard..... 76
Cutter Grinding Machine, J. Kindleberger and W. A. Arnold..... 265
Device for Opening Steam Cyl'r Cocks, W. H. Woods 116
Device for Treating Hides, H. Royer..... 28
Device, Releasing Standing Rigging, H. Witram 368
Ditcher, H. Benett..... 336
Door Butt and Marine Hinge, O. H. Foster..... 309
Door Butt, Reversible, J. Kindleberger & W. A. Arnold..... 185
Door Clamp, H. O. Hooper 60
Drill, Rock, C. H. Davis.. 249
Dust Deflector for Cars, J. P. O. Lownsdale..... 28
Ellipsograph, A. Smith... 28
Engine, Steam, W. H. T. Harris..... 377
Excavator, A. E. Peirce.. 356
Extraction of Iron and other Oxides from Clay, etc., W. Aylward..... 9
Faucet Attachment to Cans, J. H. Garrigan & F. L. Hall..... 377
Fence, Portable, Chas. E. Johnson..... 185
Fleece Bundling Apparatus, J. Walton..... 7
Flux, C. W. Moore..... 44
Funnel, H. F. Lawrence.. 44
Gate Latch, D. Shacks.... 277
Gate Latch, F. M. Ranous 304
Generator, Steam, James Stuart..... 185
Governor, Steam Engine, W. H. Howland..... 28
Grain Fork, E. W. Walton & A. J. Brown..... 309
Grape Crusher and Stem Separator, T. C. Purington..... 377
Hay Fork, E. W. Walton & A. J. Brown..... 309
Harrow and Cultivator, Combined, W. J. Funk.. 79
Harrow, Rotary, H. A. Oastcn..... 255
Harvester, G. Bonney, jr. Harvester and Cullivator, W. O. & L. T. Davis..... 345
Hay Press, E. J. Marsters 345
Heating Apparatus, John Armstrong..... 265
Hoisting Machine, Wm. Eppeisheimer..... 249
Key Guard, B. R. Hathaway..... 265
Knife Pocket, A. G. Watcrhouse..... 28
Knife Sharpener, W. H. Howland..... 368
Kyan's Wood Machine, D. W. Hunt..... 28 44
Lamp, J. W. Shchan..... 60
Latch for Double Doors, J. W. Jones..... 408
Lamp Burner, P. Prettyman..... 140
Lathe Rest, J. Brodic..... 140
Letter Box, F. Witram.... 28
Lubricating Self-Indicating, N. Siebert..... 185
Mail Bag, Z. T. Sweet.185 196
Meat Cutter, J. G. Divoll.. 28
Mechanical Power, A. Waterhouse..... 217
Medicine, Rheumatic, O. Conroy..... 265
Metallic Stuffing Box, W. H. H. Clark..... 116
Moulding Machine, Jas. Hatch..... 60
Necktie Fastening, H. M. Helnemann..... 393
Needle Sewing Machine, A. H. Suppice..... 155
Newspapor File & Music Folio, H. Burgess..... 265
Ore Crushing Mill, J. H. Day..... 196
Overshoe, A. G. Waterhouse..... 185
Passenger Register and Railroad Calendar, J. C. Hackett..... 116
Pavement, Wooden, P. Howard..... 345
Pavement Layer, Philip Hinckle..... 304
Pencil, J. Gardner..... 336
Pen, A. O. Waterhouse... 393
Perforating Burner, E. P. McCarthy..... 9
Photographic Plate Holder, J. Bechtel..... 140
Pitch Board, J. R. Drew.. 377
Plow, Frame, A. Mickelson 116
Plow, Gang, J. W. Lewis. 28
Plow, Gang, W. B. Rice.. 28
Plow, Gang, C. F. Gay.... 28
Plow, Gang, Holloway.... 309
Plow, Gang, F. A. Hill... 185
Plow, Gang, G. A. Davidson..... 265
Plow, Gang, H. K. Hutie.. 240
Plow, Gang, H. N. Dalton 249
Plow, Gang, W. Funk.... 277
Plow, Gang, W. J. Boyce & G. W. Haines..... 345
Plow, Gang, B. Jennings. 393
Plow, Gang, D. H. Gleason..... 393
Plow Cultivator, Gang, H. P. McCleave..... 309
Plows, Roller Cutter for, J. W. Lecht & Van Dyke Cons. C. M. Co..... 380
Potato Digger, Ycoom, Walker & Sharp..... 309
Process of Forming the Hubs and Spokes of Wrought Iron Wheels, T. Ryan..... 116
Process of Reducing Ores, A. I. Frick & J. B. Leckey..... 345
Process of Treating Ores, A. L. Nolf & F. L. A. Plochic..... 140
Propeller, F. C. Foster... 217
Propeller, S. B. Morey... 408
Propeller Wheel, C. T. Finiayson..... 240
Pump, C. & F. Bland..... 240
Pumping by Motion of Oars, R. R. & E. C. Speddeh..... 185
Purifying & Refining Alcoholic Liquor, Francis Schiefer..... 92
Railway, Imp., Sutton & Crouch..... 44
Rake, Horse, W. Sharkey 393
Rake, Horse, O. Bouncy.. 365
Roasting Process, William Bruckner..... 28 44
Rock Drill Point, C. H. Davis..... 140
Rock Crusher, J. H. Day. 172
Salve, Compound, Nicn. Lumsden and F. Lessman..... 28
Saw, Crosscut, C. Arthur 265
Sawing Machine, G. W. Benson & F. F. Dolaud.. 92
Screen Punching Mach., J. W. Gilmer..... 172
Screw Propeller, F. Witram..... 140
Scribe Hook, J. Nester... 418
Seat for Chairs, etc., F. Witram..... 393
Seat for Vehicles, S. B. Simmons..... 28 217
Seeding Machine, J. Finlayson..... 408
Shaft Attachment for Carriages, T. C. Walter 185
Shampooing Apparatus, M. L. Winn..... 309
Shingle Machine, G. F. White..... 92
Shrub and Flower Box, G. Gundelfinger..... 172
Sleeping Car, M. Allison Wheeler..... 76
Sluice Box, D. F. Hawks. 249
Sluice for Saving Sulphurets, O. Jennings..... 28
Snow Plow and Excavator, A. H. Jackson..... 277
Spark Arrester, Isaac H. Crane..... 9
Spark Arrester, John W Bowker..... 277
Spoke Tenoning Machine, F. H. Brinkhoffer 185
Spring Wagon, F. Scherb. 240
Stamp Mill, Rice & Vantern..... 217
Stave Jointing Machine, M. & L. & R. Fulda..... 393
Step-Ladder, C. E. Roman 28
Submarine Foundation, W. H. Foye..... 28 44
Sugar, Manufacture of, C. Spreckles..... 44
Teeth, Uniting Artificial on Rubber Bases to Met. Plate, J. Lecht..... 209
Ticket Punch, J. Gardner 368
Tobacco Substitute, J. B. Webster..... 60
Tooth Wash, P. Ringpey.. 185
Trap for Animals, D. Harwood..... 76
Trap, Gopher, D. N. Smith 304
Trap, Screen, J. Brown.. 368
Truck Greaser for Sewing Machine, J. H. Mooncy. 393
Turbine, A. M. Harding.. 368
Valve for Steam Engine, W. H. Howland..... 28 44
Valve, H. Lombard..... 336
Varnish, Porcclain, W. H. Kimber..... 277
Velocipede, N. Landry.... 185
Vinegar, Manufacturing, F. Schiefer..... 92
Washing Machine for Dishes, C. M. Leland.... 44
Washing Machine, Herman Carmer..... 172 346
Watch Wheel Holder, A. W. Klentoff..... 76
Water Closet Pan, W. Smith..... 377
Water Closet Valve, W. Smith..... 28 217
Water Wheel, H. P. Mcclcave..... 393
Water Wheel, H. S. Stewart..... 336
Water Wheel, J. G. Frederhurr and W. V. Andrews..... 336
Wheelbarrow, B. W. Tut 240
Wheels, Corundum, Making, A. W. Calder..... 116
Wheels for Vehicles, P. E. Smith..... 185 198
Windmill, W. I. Tustin... 368
Window Shades, Hanging of, J. J. Tay and L. L. Sawyer..... 393
Wind Wheel, L. Fischer.. 393
Wire Cutter, H. Axtell.... 60
